the students liked the utility, the characteristics of their teacher, and the learning activities employed. Dislikes were associated with the personality of the teacher and the lack of adequate learning activities in some units of study (pp. 39-41). Since there were significantly fewer dislikes stated for the American Industry courses in comparison with other courses in the students' schedules, the judgment of these students appears to be very favorable.

The Project is also interested in the vocational behaviors of the students in its sample. At the close of each American Industry course the students involved in the evaluation record their vocational preferences on the Project's Occupational Preference Form. They also indicate the reasons for their choice, how they intend to prepare for the occupation, and who influenced them to make their choice. For the most part, however, collection of data in this realm will be a long-term task.

A follow-up study has been funded for 1970. It is the hope of the Project staff that a more extensive follow-up study may be undertaken. Most of the questions associated with the influence of the study of American Industry on vocational behavior will require data from the vocational experiences encountered during the first five to ten years out of high school. Of special importance will be the career patterns of students in the evaluation.

A longer follow-up study would permit an evaluation of the exploration period of vocational behavior and the initial phase of the establishment stage. Moreover, a follow-up study over this period of time would probably span at least two business cycles. And, it would not be as vulnerable as a short-term follow-up to an event such as an increase in the military draft. In any event, vocational behaviors will have to be analyzed and judged in light of the existing level of the economy and any other factors that might influence job entry and advancement.

The students' grades in the American Industry courses are submitted to the Project by the participating teachers. A part of the 1966 summer workshop was devoted to in-service instruction in evaluation. In addition, the teacher materials contain suggested evaluation techniques. Hence, these grades should reflect, to a fair extent at least, the attainment of course objectives.

A number of the actions of the participating teachers indicate that they have been influenced by their exposure to American Industry. Several have taken an interest in investing in the stock market. And, two men resigned from the Project so that they could start their own businesses.

Changes in the professional interests and activities of the teachers have also been noted. Calls have been received by the Project for information which was not available in the local community but which was needed to complete a research activity. Recent questions by the teachers have given evidence of an increased awareness and interest in the philosophical and practical problems in industrial education.

Some special evaluation techniques are being investigated for use in the Project's evaluation program. For example, the free association method of analyzing meaning discussed in separate articles by Noble (1952) and Deese (1962) is being tried out during the 1966-67 school year. Also being tried are tape recorded interviews with selected students.

The previous paragraphs have described the data collected on the "products" associated with the study of American Industry. However, there is more to evaluation than collecting data. Appropriate analyses have to be carried out to isolate the facts embodied in the data collected. Note that a variety of instruments are being employed to gather data. This approach was selected to avoid the singular bias of any one measuring technique.

Three different categories of evaluation are being utilized by the American Industry Project. The knowledges, skills, and understandings which result from the study of American Industry are compared with the objectives stated for the courses. The purpose of this evaluation is to describe the extent to which the objectives are attained. American Industry students are also compared to students who do not enroll in these courses. This is done to assess the magnitude of the effect of the formal study of American Industry. Two levels of comparison, experimental, and quasi-experimental, are included in the evaluation program (Campbell and Stanley, pp. 171-246). In as many participating schools as possible, arrangements are made for an experimental design. However, this has proved to be impossible in some settings and a quasi-experimental design has had to be employed. At the present time there are seven experimental settings and six quasi-experimental.

As noted earlier in this paper, the participating schools were, for the most part, not selected on the basis of a sampling plan. Thus, a question can be raised concerning the representativeness of the results obtained in these schools. In recognition of this circumstance, two decisions were made. First, as much information as possible would be collected on the characteristics of the students participating in the evaluation. To obtain information that would be amenable to comparison with existing data permission was obtained from Project TALENT to utilize several of their information forms. Through this procedure the Project will attempt to determine how typical or atypical its students and schools are.

The second decision was to treat each school as a separate experiment and analyze results in terms of the specific school setting. Moreover, no attempt would be made to generalize to schools not in the sample. Rather, the results will be reported in detail, and any school considering the adoption of the American Industry curriculum will have to consider this evidence in relation to the nature, philosophy, and goals of their school system.

*YOUTH EMPLOYMENT; *YOUTH PROBLEMS; YOUTH OPPORTUNITIES; EMPLOYMENT PROJECTIONS; UNEMPLOYMENT; LABOR FORCE; *MANPOWER DEVELOPMENT; VOCATIONAL EDUCATION; VOCATIONAL DEVELOPMENT; *EMPLOYMENT OPPORTUNITIES; PUBLIC POLICY; YOUTH PROGRAMS; *PROGRAM IMPROVEMENT

The several subcommittees of The Committee on Youth Employment generated more than 90 recommendations relative to the unemployment problems of youth. Through a distillation of these recommendations and a Committee consensus that new and stimulating policies for education and training, guidance, employment opportunities, and economic growth are imperative for meeting the challenge of preparing all youth for future productive employment, 15 final recommendations were prepared. The recommendations were drawn from facts indicating that large numbers of youth were unemployed and the outlook for the future was dim unless programs were implemented to insure that opportunities for training and jobs would be available to the vastly larger number of youths entering the job market in the 1960's and 1970's. Some of the 15 remedial actions recommended were: (1) Each state and city should establish a continuing commission on youth affairs concerned with youth employment, (2) Employers and unions should reexamine their hiring, training, and promotion policies and programs to see how they can better employ young people and eliminate the discrimination against minority youth, (3) School officials should reappraise their instructional program in the light of labor market demands and they should strive immediately to bring inadequately educated out-of-school youth up to at least minimum standards of employability, and (4) A federal program for urban and conservation employment and training of youth should be enacted promptly. The appendix contains statements of individual committee members who differed with the Committee's recommendations or wished to express additional views. "Reports of Subcommittees of the President's Committee on Youth Employment" is available as VT 002 817. (ET)

Attorney General of the United States

Orville L. Freeman
Secretary of Agriculture

Luther H. Hodges
Secretary of Commerce

Anthony J. Celebrezze
Secretary of Health, Education, and Welfare

Stewart L. Udall
Secretary of the Interior

Robert C. Weaver
Administrator, Housing and Home Finance Agency

Dr. James B. Conant, *Vice Chairman*

Cristobal P. Aldrete
County Attorney, Del Rio, Tex.

Joseph A. Beirne
President, Communications Workers of America, AFL–CIO

Oran I. Brown
Director of Industrial Relations, Rand McNally & Company

Dr. Samuel M. Brownell
Superintendent of Public Schools, Detroit, Mich.

Eli E. Cohen
Executive Secretary, National Committee on Employment of Youth

Mark W. Cresap, Jr.
President, Westinghouse Electric Corporation

Dr. Howard Dawson
Executive Secretary Emeritus, Department of Rural Education, National Education Association

Buford Ellington*
Governor of Tennessee

James R. Fleming
President and Publisher, The Journal-Gazette, Fort Wayne, Ind.

Cornelius J. Haggerty
President, Building and Construction Trades Department, AFL–CIO

Donald J. Hardenbrook
Chairman of the Board, National Association of Manufacturers

Mrs. Thomas Herlihy, Jr.
Chairman, National Committee for Children and Youth

Mrs. Mildred M. Jeffrey
Community Relations Director, United Automobile, Aerospace and Agricultural Implement Workers of America, AFL–CIO

Mrs. Clifford N. Jenkins
President, National Congress of Parents and Teachers

Mrs. Geri Joseph, of Minneapolis, Minn.

Mrs. Mary C. Kohler, of New York, N.Y.

Henry W. Maier
Mayor of Milwaukee, Wis.

George Meany
President, American Federation of Labor and Congress of Industrial Organizations

Mrs. Agnes E. Meyer, of Washington, D.C.

Joseph Monserrat
Director, Migration Division (New York, N.Y.), Commonwealth of Puerto Rico Department of Labor

Dr. James M. Nabrit, Jr.
President, Howard University

Frank H. Neely
Chairman, Executive Committee, Rich's

James F. Oates, Jr.
President, Equitable Life Assurance Society of the United States

Mrs. Eleanor F. Slater
Rhode Island House of Representatives

Richard Wagner
Chairman, Executive Committee, U.S. Chamber of Commerce

Whitney M. Young, Jr.
Executive Director, National Urban League

*Resigned December 31, 1962, on completion of his term as Governor of Tennessee.

PRESIDENT'S COMMITTEE ON YOUTH EMPLOYMENT

WASHINGTON 25, D.C.

April 24, 1963

The President,
The White House,
Washington, D.C.

Dear Mr. President:

Your Committee on Youth Employment is honored to submit the attached report and recommendations: "The Challenge of Jobless Youth."

This report reflects a consensus of Committee views reached through many meetings and much discussion since its appointment by you on November 15, 1961.

The Committee's 15 recommendations set forth in the report represent a distillation of more than 90 recommendations which emerged from the several subcommittees. In brief, the Committee believes that new and stimulating policies for education and training, guidance, employment opportunities, and economic growth are imperative. The challenge is urgent, the task is large, and the time is now.

These proposals present a challenging platform for action for government agencies and private groups, as well as for each of us as citizens.

The Committee is available for any further service you wish, and is deeply appreciative of the opportunity to serve and to convey its views to you on a problem of the deepest concern not only to our youth of today and tomorrow but to the strength and character of our Nation in the decades ahead.

Respectfully,

W. Willard Wirtz

W. Willard Wirtz
Chairman.

DIMENSIONS

Today's youth are tomorrow's adults—production and service workers, technicians, professionals, clerks and managers—parents or other heads of families. For most, their admission to this adult world, their badge of belonging, is a job. But it is much harder today for a boy or girl with limited education and training to get a job. The numbers of young people between 16 and 21 have increased greatly over the last generation because of the rise in the birth rate starting in the 1940's. The kinds of jobs they used to be able to fill are disappearing, and many of the jobs that are available demand much more skill and training than they now can offer.

To hundreds of thousands of boys and girls between 16 and 21, the problem is immediate and desperate. One out of nine who are out of school and in the labor force is jobless. Among these are tomorrow's castoffs and chronic dependents, those who will live in poverty of body and mind, and who will bring up their children in their own image.

OF THE PROBLEM

By themselves, they cannot change their situation. Without immediate, bold, and imaginative action, these young people today and a much larger proportion tomorrow will be foredoomed to failure and frustration.

Underlying all efforts to help youth is the need for expansion of the economy. Unless the number of job opportunities for all workers can be expanded it is unrealistic to expect that jobs for youth will be substantially increased. Every available step should be taken by government and private enterprise, therefore, to stimulate and strengthen the economy, accelerate its growth, increase its productivity, and expand employment.

Even while efforts are being made to strengthen the economy, however, much can be done to employ more young people.

As Americans the challenge of youth unemployment confronts us all.

This challenge cannot be turned aside by a statement that most young people with adequate preparation will find steady, satisfying, and productive work at good wages. Unfortunately, other hundreds of thousands of boys and girls can look forward only to lives of drudgery and intermittent work. For them the outlook is bleak. Life is empty, with survival the only incentive.

This condition need not exist. But it will continue to exist unless the conscience of Americans can be moved to action, determined to see that all boys and girls have the chance to become a part of the productive world.

The facts are startling:

- During the school months of 1962 from 600,000 to 800,000 young people between 16 and 21—as many as the entire population of cities the size of San Francisco, St. Louis, or Boston—were out of school and looking for jobs.

- About 1 in 6 of all the unemployed who are out of school are 16- to 21-year-olds, although this age group makes up only about 1 in 14 of the Nation's labor force.

- Unemployment among teenage Negro youth is double that of white boys and girls.

- School dropouts suffer most from unemployment and have greater difficulty in finding work.

Coupled with these sobering facts about the present is the even more disturbing outlook for the future. We face an unprecedented growth in the number of young people and a substantial reduction in the numbers of jobs traditionally open to youth.

- Twenty-six million boys and girls will leave school and seek jobs during the 1960's, 40 percent more than in the 1950's. By the late 1960's three million new young workers will enter the labor force each year.

- If our current rate of youth unemployment persists, as the youth population increases, by 1970 the number of unemployed youth will be close to 1½ million.

- Only about 1 in 10 boys now living on farms can expect to make an adequate living in agriculture.

- In the 1960's, while the labor force is growing so rapidly, employment needs for unskilled workers will remain about the same and for farmworkers will drop about 20 percent. These occupations have always been an important source of beginning jobs for young men coming out of school. By contrast, jobs will rise by about 40 percent for professional and technical workers, and 20 percent for sales workers and for managers and proprietors.

- At the same time, more education and training is now required. The average professional or technical worker now has more than 4 years of college; clerical workers have more than a high school education.

The world confronting young people today is different from the world of their grandparents or parents. Old answers are outdated.

Before 1910 and even in the 1920's, many jobs were open to young people. Youths were needed on farms, were employed in local distribution and service trades, in factories, shops, and even mines. Nearly everyone could count on finding a job he could do with relatively little schooling.

These conditions no longer prevail. Our living and working standards as well as our job requirements now impose greater demands.

Automation, mechanization, and scientific advances are causing many unskilled jobs to disappear. Today's and tomorrow's jobs require higher skills, more maturity and judgment, and more experience.

More and more workers, both blue collar and white collar, are finding that their occupations differ materially from those of a decade ago. Most workers of a previous generation could expect, after learning a trade, to follow that trade as a life's work. Today, retraining and reeducation are being demanded.

The Armed Forces still provide training and education for substantial numbers of young men but in smaller numbers than formerly. Also, they take considerably fewer of those who score very low on the qualification test.

The failure of large numbers of boys and girls with above-average academic ability to enter college or, having entered, to graduate reduces the number of job opportunities open to the less able young worker. Studies by the National Science Foundation indicate that, nationally, less than half of those in the top third of their high school graduating class go on to graduate from college. Clearly, these youth are not benefiting fully from the educational opportunities open to them. The result is that they take jobs at less than their potential capacity, thus overshadowing other young people with lower abilities who would be able, nevertheless, to handle the jobs adequately if they could get them.

If the large numbers of boys and girls who are equipped to succeed in college completed the work required to train them for technical or professional jobs, the Nation would benefit by the fuller use of their capacities, and the shortage of skilled and technically trained manpower would be reduced. At the same time, the number of opportunities for less qualified young workers would be increased.

One major fact unites the hundreds of thousands of young people who are out of school and out of work. Confronting a world where jobs are scarce and diverse, they are unprepared to take many of those available today, and will be less prepared tomorrow as hiring requirements rise.

These young people differ widely in many personal characteristics. They include boys and girls, whites and nonwhites, farm and city youth, youngsters who have not finished junior high school and those with high school diplomas. They come from good schools and poor ones, with a wide range of abilities and attitudes toward work and the world about them.

Many of the unemployed youth live in congested city areas, surrounded by social disorganization, poverty, and despair. Their families usually occupy most inadequate housing. They are surrounded by other disadvantaged people, many of whom are unemployed or intermittently employed at low wages. Without successful examples among their elders to guide them, the youth of such families are unlikely to succeed.

Many of these slum families have come from rural areas where farm opportunities have declined sharply. Their financial resources are likely to be small, their understanding of city ways limited. Friends and relatives are of little value to them in finding a job. Coming from rural, sometimes segregated, schools, the preparation of both parents and children for city life and work is likely to be inadequate.

Girls as well as boys should take full advantage of the education and training available to them as teenagers. Girls' problems of jobfinding are most acute, not at school-leaving age but much later, when they are adults and their family responsibilities may require their entry or reentry into the labor force. Women already constitute one-third of the labor force, but girls, because they typically plan for marriage and homemaking, rather than career jobs, are too frequently content with acquiring only relatively low skills. Thus they are likely to be handicapped later in life when satisfying and remunerative employment may be so important to them.

Negro or other minority youth suffering from discrimination face even more cause for frustration, resentment, or defeat.

Opening job opportunities to unemployed youth means unlocking not one door but many. Discrimination bars some of them from jobs for which they are qualified. Some simply need additional training and preparation. Others are unable to read and write well enough even to apply for a job, let alone to perform one adequately. Some have never acquired the kind of self-discipline which is needed to work steadily. Many have not learned to find satisfaction and personal fulfillment through working. Some are unrealistic, holding out for jobs which are not available or which make demands they cannot meet. Some are qualified, but cannot find jobs.

No simple way exists to lift these boys and girls out of their idleness and frustration. Hundreds of thousands of jobs and training opportunities are needed, in thousands of different communities and neighborhoods. The solution is difficult precisely because the need is immediate and urgent, responsibility is fragmented, and no single program can provide a major share of the opportunities required.

The solution to these problems must be sought in two directions. Two questions must be answered:

- What can be done now to make job opportunities available to the hundreds of thousands of young people now out of school and unable to find work?
- What should be done in the longer run to insure that opportunities for training and jobs will be available to the vastly larger number of youths entering the job market in the 1960's and 1970's?

We believe the proposals which we are presenting in this Report constitute a necessary minimum program to develop the potential present in our young people.

We believe further that the cost which they entail will be repaid many times over in the constructive energies which they release in these young people and in greatly reduced costs of dependency.

Private enterprise, the major source of all employment, necessarily has a major responsibility for employing youth. Both management and labor must recognize the importance of their roles in employing and training youth. However, both must support and work with public and private agencies, since only through an effective partnership of all forces can the problems be solved.

Such a partnership is imperative in order to marshal resources on many fronts at once. Both our immediate and long-range recommendations will be effective only if diversified resources are jointly committed to the attack on youth unemployment.

In many areas, substantial progress has been made. Some neighborhoods, cities, and States have identified problem areas, determined what action is needed by what agencies, and coordinated available resources in a concerted attack on the problems of jobs and training.

We believe that such efforts should be started in every community, and where they already exist should be extended and strengthened.

RECOMMENDATIONS

IMMEDIATE NEEDS

1. We recommend that the governor of each State and the mayor of each city establish or initiate a continuing commission on youth affairs concerned with youth employment.

Where youth commissions already exist, the governors and mayors should see that youth employment is included in their charge, and that aggressive programs are sponsored to provide job and training opportunities. Where the commissions are operative but not aggressive, they should be revitalized.

In some areas, such commissions will need to be organized by counties, metropolitan districts, or appropriate local political subdivisions as, for example, the District of Columbia.

Such commissions should be representative and nonpartisan, and should include the agencies which deal with youth preparation and employment. They should weld existing resources—schools, employment agencies, employers, labor groups, service organizations, and welfare agencies—into a force to improve the opportunities for youth. A major task will be to develop public understanding of the problems of youth unemployment and of the close relationship between employment and effective education and training.

State commissions should formulate policy and consider needs for legislation in the fields of education, counseling, training, labor standards, and research. They should develop a coordinated fact-finding program which will identify and describe unemployed youth, and which will locate and describe existing jobs. It is expected that the additional costs, if any, of operating these commissions will be met from State, local, and private sources.

Local commissions should coordinate the activities of local public and private agencies responsible for education and training, jobfinding, and counseling and guidance. They should be the channel for developing and coordinating programs for youth employment to meet the needs of their communities, and of specific neighborhoods where the need is the greatest.

Here is where the problem is, and here is where the solution must be found. Federal programs for full employment, aid to vocational education, and subsidized work experience are of major importance in meeting the challenge, but they must make their impact in the local community. Local management, labor, citizen groups, schools, and other agencies should join together to determine what is to be done, how each can help, and what timetable is to be adopted.

Note: Some individual Committee members differed on several recommendations in the Report, or wished to express additional views. Their statements appear in the appendix.

687084 O—63——2

2. Employers (including private business and industry, and private and public agencies) and unions should reexamine their hiring, training, and promotion policies and programs to see how they can better employ young people. Vital to this recommendation is the elimination of discrimination against minority youth.

These efforts should seek to:

a. Reduce education and skill requirements, where practicable, for beginning level jobs, and set up appropriate on-the-job training programs. Demonstration projects indicate that many young people who now cannot get jobs have, in fact, considerable potential if they are properly prepared.
b. Develop training programs to facilitate the upgrading and promotion of employees to higher level jobs, thus creating vacancies at beginning levels for which unemployed youth may be hired and trained.
c. Review possibilities for undertaking work of economic usefulness which is not now being done. The Committee is convinced that with imagination and determination many job opportunities (including part-time jobs) could be made available to youth. Business and industry, voluntary agencies, social service groups, and local, State, and Federal agencies should all examine their needs to determine how many young people they could usefully employ at such tasks.

The facilities of the 1,900 public employment offices of the State employment services affiliated with the United States Employment Service are an important locally available resource to assist employers, schools, and community agencies in helping youth to make the transition from school to work.

We urge the United States Chamber of Commerce, the National Association of Manufacturers, and other employer groups both private and public to endorse the proposals in this recommendation and to join in a national effort to promote them among their members.

3. Unions as well as employers should reexamine and revise those rules, contract provisions, and practices which unduly restrict the entry of youth into beginning jobs. Vital to this recommendation is the elimination of discrimination against minority youth.

To open up established apprenticeship programs for unemployed youth, sponsors of these programs should institute pre-apprentice training. This preparation, lasting 1 to 6 months, would be conducted off the job. Young persons would thereby acquire elementary knowledge of tools and skills needed to make them productive from the first day of employment in regular apprenticeship programs. Upon successful completion of this training, the individual would be admitted to established apprenticeship programs, with credit allowed for the time spent in pre-apprenticeship training. Provision should be made for suitable training allowances to pay for transportation and incidental expenses. Costs should be borne by industries, unions, and vocational education and other existing funds. The program would offer effective and practical screening for apprenticeship training, helping both employers and unions to get better qualified apprentices.

Where collective bargaining agreements prevent the carrying out of this recommendation and the preceding one, unions and employers should negotiate changes and cooperate in establishing programs designed to encourage youth employment. The AFL–CIO is urged to lend its support and encouragement to such efforts and to seek the cooperation of its member organizations.

4. To expand apprenticeship training to new trades and to open up apprenticeship opportunities, the Secretary of Labor should arrange for a study and review of apprenticeship training programs and future needs.

Changing technology, labor mobility, shifting occupational requirements, and developments in teaching techniques all point to the necessity to increase both the quantity and quality of apprenticeship training, and to extend those programs to new occupations.

5. School boards and other school governing bodies in local communities should develop within their systems intensive programs to bring inadequately educated out-of-school youth up to at least minimum standards of employability immediately.

Local school systems should set up crash programs for the great numbers of boys and girls who are out of school and unable to get jobs because they lack basic skills in reading, writing, speaking, and the use of numbers. Such programs will require that funds be made available to obtain adequate classrooms and skilled teachers, able and anxious to impart the minimum skills which will enable these young people to find and keep jobs.

6. A Federal program for urban and conservation employment and training of youth should be enacted promptly.[2]

Youth unemployment is so serious and so widespread that special opportunities for employment and training in urban and conservation projects which will increase the employability of youth are necessary under conditions that will provide disciplined work experience. We support a $100-million appropriation each year for 3 years for this purpose. Future use of this approach on a longer range basis should depend both on need and on the success of this initial venture.

7. The Manpower Development and Training Act should be amended so that a more realistic proportion than the present 5 percent of annual training allowances in the act be made available for unemployed youth. In addition, training allowances should be provided for young people 16 through 18 years of age who have been out of school and out of work for 1 year or more.

The present law provides that 5 percent of the total training allowances paid annually may be used for youth. Substitution of a higher percentage would permit more young people to enter training programs. Extension of training allowances to younger boys and girls would assist them, as circumstances required, to get the training they must have if they are to find jobs.

[2] Two members dissented from this recommendation and five members wanted a stronger statement. Their views appear in the appendix, p. 14.

FUTURE JOBS FOR YOUTH

More and more young people are reaching working age each year. By 1970 the number of boys and girls reaching 18 will be 3.7 million—about one-third more than the 2.8 million in 1962.

While making opportunities available for the hundreds of thousands of young people now out of school and not at work has the highest priority, we must without delay start work on programs which will not only keep the number of unemployed youth from rising as the population grows, but will cut it down as rapidly as possible.

The answer to our long-range problem is a double one: more jobs that young people can fill, and better preparation to equip them for their future jobs.

As we have previously noted, more jobs for more young people depend primarily upon an increase in the Nation's rate of economic growth. But other than economic measures and programs are also needed. Most important of these are the revision, expansion, and improvement of the various means of education and training, so that boys and girls now in school will have a clearer idea of the nature of the jobs that will be available, the training and education that will be required of them, and the avenues of advancement open to them.

The link between job opportunities and better preparation is very close. In fact, one of the most fundamental conditions of future sustained economic growth is a better educated and better prepared youth. We believe that investment in the education and training of workers has a positive influence on the growth of our economy and the prosperity of our people.

Specifically, we make the following long-range recommendations:

8. Local school boards and school administration officers should take the necessary steps to improve teaching methods and strengthen curricula for those young people going directly to work from secondary schools.

Such actions should:

a. Identify nonachieving children early, with the reasons for their failure.
b. Institute remedial teaching where this is indicated.
c. Broaden curricula to provide courses and teaching techniques aimed at meeting the needs of children who are not academically oriented.

d. Make available work-experience courses for pupils at ages under 16 where such courses seem advisable as an aid in teaching work habits and holding the interest of children who might otherwise drop out of school.

e. Set up programs to teach those youth who, having left school, are aware of deficiencies in their schooling or want further training.

f. Make available, for all youth capable of benefiting from it, an additional 2 years of school beyond high school. These years should be used to provide more adequate preparation for subprofessional and technical occupations and should serve to improve the basic education of those who will not go on to college.

g. Expand and improve guidance and counseling services to help pupils plan their school and work careers and assist them in managing their personal and developmental problems.

Our schools face what may be the principal challenge of 20th century public education in gearing their programs to meet the rapid changes in our economy and technology. While the schools have other goals besides the preparation of boys and girls for work, they bear an important share of the responsibility for equipping young people for jobs.

More children than ever before are attending high school and the number being graduated is larger than ever before, yet 1 out of 3 leaves high school before graduation. This dropout rate is totally unacceptable in a nation whose future depends upon greatly increased competence and skill.

The dropout problem must be attacked in the home, the school, the church, local voluntary organizations, employment offices, and any other place where youth, at a critical period in their lives, can be helped toward fuller development of their potentials. A major focus lies in the schools, which should provide a wider variety of teaching better geared to the needs of different types of pupils, as well as exploratory work experiences responsive to their needs and capable of arousing and holding their interest and participation.

School administrations should provide challenging programs for the outstanding students. At the same time, schools should develop the full potential of those students whose top goals do not include graduation from college. While this proposal is not new, its vital importance is sometimes overlooked in our eagerness to encourage the fullest development of those who show promise in science and mathematics.

Counseling and guidance are important. Counselors can help young people plan their school and work careers, and can do much to help in the solution of personal and developmental problems which block effective planning and achievement. A clearer knowledge of the kinds of jobs available, the preparation they require, and the rewards they offer would do much to help young people prepare for and find jobs and advance as they grow in competence and skill.

In a school system operated in 50 States, under thousands of school boards and authorities with widely divergent views of education, levels of support, and number and types of pupils, any generalization is bound to have its limitations. Nevertheless, in discussing national problems, some generalizations are necessary. Many schools do a good job of preparing their students for the future. Many have been inadequately supported and financed, and for this and other reasons have failed to reach their pupils effectively.

We believe, however, that the problems of *all* schools are growing, and that if they are to bear their necessary share of preparing pupils for a more complex future they must be given more adequate financing, greater public understanding and support in their attempt to reach all children, and increased recognition as a major instrument of guidance and leadership.

Many schools have made strenuous efforts to adjust their facilities to the tremendous influx of new pupils, and to develop programs to meet the needs of changing methods and technologies. Some have fallen behind in this struggle, and fears are widespread that the gap will widen.

Many of the youngsters who have not been able to get jobs are poor performers in school; many are dropouts. Their attitude toward school, whether resulting in their retreat from full participation or in their actual physical withdrawal, reflects a decision that school is not giving them what they want. However subjective and self-defeating this decision may be, it is a fact which must be dealt with if we are to achieve substantial improvement in education and training.

9. Additional funds must be provided to enable the schools to extend and improve their programs.[3]

School boards and school superintendents are generally aware of the needs of their school districts. Improved school programs can be provided only if resources are made available. In the cities, particularly, school administrators are struggling to operate present school programs with too few teachers, not enough buildings (many of them obsolete), and inadequate budgets. Addition of another 2 years of school, special programs for those who now drop out, supervision of extensive work-experience programs, increased counseling services, and the like require funds for added staff, added buildings and equipment, and increased operating costs.

The resources required to eliminate youth unemployment are substantial. Yet the sound and wise choice is not simply between spending the money or not spending it. Inevitably, large sums will be spent on youth whether jobs are made available or not. But if we as a nation can provide more and better education for boys and girls through schools and on-the-job training, we will certainly pay less for welfare measures, control of delinquents, and other tangible and intangible costs of failure to prepare young people for life. To a significant degree, our choice is between fruitful investment for the future and heavy expenditures to combat the social costs of idleness. Our response must be clear and unequivocal.

The resources for increased and improved education, including teachers, buildings, equipment, and maintenance, can be supplied through increased local, State, and Federal taxes or private programs, provided by labor and management in the training programs they set up, or they can result from a combination of these sources.

Where necessary and possible, local school districts should immediately increase school taxes. Since local districts depend heavily on the real property tax, and in many States the rates are constitutionally restricted, there may be severe limits upon further local financing. States should determine their individual needs and should make immediate and substantial additions to school funds to achieve the goals of these recommendations. We urge the Congress to recognize the Federal responsibility in reference to the programs set forth in the Report.

10. The Secretary of Health, Education, and Welfare and the Secretary of Labor should cooperate to improve vocational counseling.

Specifically, they should:

a. Give immediate encouragement and such assistance as is necessary to State departments of

[3] Additional views by individual members appear in the appendix, p. 15.

education and State employment services, and through them to local schools and employment offices, to provide special training programs so that vocational counselors may be more adequately prepared, especially to help those young people who plan to go directly from high school to work.

b. Set up a clearinghouse to gather and disseminate information on successful vocational guidance, counseling, and motivation programs.

11. Existing vocational education laws and practices should be reexamined by the Congress and State vocational education authorities.

Where necessary these laws and practices should be revised to:

a. Eliminate irrelevant or out-of-date limitations on the availability of Federal funds.

b. Strengthen the vocational and technical education programs by offering Federal reimbursement for training in more and different occupations. Information about job trends from public employment services, counseling and guidance organizations, as well as occupational outlook materials, should be used in determining new vocational education programs. Courses for out-of-school youth should be either on a part-time or full-time basis, regardless of whether the youth is employed in the trade for which he seeks training. These courses should provide for teaching of short-term or long-term occupational skills.

c. Provide for a continuing reexamination of programs and expenditures so as to assure that they reflect changing job needs and patterns.

d. Insure that Federal vocational money should go only to States where the vocational education courses are open to all without regard to race, creed, or color.

12. Area skill centers, or technical or vocational schools, should be established in many new central locations.

Developed and administered by cities, counties, school districts, or other governmental units, these schools should draw their pupils from a large enough area to permit full staffing and equipment, and should offer a wide variety of courses. The size of the area served will vary; there may be a number of centers in a large city, or a single center for several counties. The schools should be open to adults as well as young people for full-time and part-time instruction. Their entrance dates should be flexible, and times at which courses are offered should be spread over both day and evening hours. The curriculum in these schools should provide training for any occupation in which a job may be reasonably expected and for which youth may be qualified. Training programs for high or less demanding skills should be adequate and of reasonable duration in order to prepare boys and girls for the occupations they propose to enter.

13. The Secretary of Labor and the State labor commissioners should reexamine certain child labor provisions and practices to determine the extent to which minimum and carefully safeguarded changes may be appropriate to help youth acquire suitable work experience in connection with their schooling.

The Committee believes that many boys and girls could benefit from extension of school-work and work-experience programs and that some limited changes in laws and regulatory practices could facilitate the expansion of such programs without undermining existing safeguards. To this end the Committee suggests that consideration be given to:

a. Establishment of experimental programs to determine the feasibility of minor modifications in child labor standards to permit participation of boys and girls of 14 and 15 in meaningful school-work and work-experience programs, where such participation is recommended by the school authorities and where the school authorities cooperate in and supervise the programs.[4]

b. The extent to which the Secretary of Labor, under his existing authority and consistent with the protection the law requires, should set special minimum wage rates to encourage the development of suitable school-work programs.

c. Revision of the coverage of so-called hazardous occupation orders in State laws which restrict the employment of youth under 18, so as to extend the protection of such orders to youth in occupations which provide new hazards, and to withdraw those orders where the hazards no longer exist.[5]

Much has been made of the barriers which child labor laws put in the way of youth employment. After careful examination of the provisions and application of these laws, we have concluded that they do not materially limit jobs for youth, except

[4] Two members dissented from this recommendation. Their views appear in the appendix, p. 15.

[5] One member dissented from this recommendation. His views appear in the appendix, p. 15.

insofar as they achieve their intended purpose. Their modification would contribute very little to youth employment, but on the contrary removal of the protection would do great damage.

Recent experience suggests, however, that work-study programs do hold promise for keeping some young people in school who might otherwise drop out. More dropouts leave school at age 16 than at any other age. The present laws restricting part-time employment during school hours for youth under 16 make it impossible for many of these youngsters to try out a combined school and work program before leaving school. Arrangements under which potential dropouts of 14 and 15 are permitted to work part-time during school hours, under close supervision and as part of their education program, might measurably reduce the number of school dropouts. Experimental programs directed toward these objectives should be encouraged.

14. The educational opportunity afforded by school attendance laws together with the protection of child labor laws should be extended to include all children in the school district, including those of migratory farmworkers.

Equality of protection as well as of educational opportunity is a birthright of all children.

Neither should be denied to boys and girls, whether they live or work in cities, on farms, or in migratory camps with their parents.

15. Young men should be given the preinduction examination at the time of registration for Selective Service, or as soon as possible after they are 18, to permit the early identification of physical or educational defects and the introduction of remedial programs.

Current pilot programs for the rehabilitation of those rejected for military service on physical grounds should be applied to all; the program should be extended to include those rejected because of inadequate education and attainment. The Selective Service System, the Department of Defense, and the Department of Health, Education, and Welfare should cooperate in these efforts.

ADDITIONAL STEPS NEEDED

Certain additional steps are needed to supplement and strengthen these recommendations.

Essential factual and statistical information on the Nation's labor force and manpower resources and requirements should be obtained in greater detail. Existing data have materially aided the Committee in its work, but much more information is necessary if, as a nation, we are to deal intelligently and imaginatively with the training and employment of our youth.

The Committee urges that more information be developed regarding (a) the age, sex, education, race, residence, and employment characteristics of youth; (b) present and prospective job vacancies and opportunities; and (c) the experiences of various pilot or local "jobs for youth" programs which have been undertaken in scattered communities. Some of this information must be compiled by appropriate Federal agencies; other data can come only through the resourcefulness of local communities.

We urge also that a major campaign be undertaken, using all forms of mass communications media, to inform the public about youth unemployment and the measures needed to combat it. A massive well-directed information campaign could do much to advance the programs suggested here to promote jobs and education opportunities for youth.

CONCLUSION

Young people face a world of promise and unprecedented challenge.

They are confident, eager, and anxious to enter and to succeed in the adult world, as were their fathers and grandfathers. We must not allow this venturesome spirit to be dulled by the discovery that jobs do not exist, or that those that do are out of reach.

Young people today must be determined and adaptable if they are to fit into the rapidly changing world of jobs and careers. They must be much better prepared than were their elders. But many thousands of them lack an understanding of the preparation required. At the moment, for them the rewards lie behind an invisible curtain which, unaided, they cannot lift.

The challenge is not to youth alone, but to all of us. It is a challenge to our determination to conquer a fast-growing new problem with deep roots and many branches, and to our willingness to substitute new ideas for old habits and patterns.

New and stimulating policies for education and economic growth are required. Fresh approaches are needed in the responses of management and labor toward the hiring of youth. Youth itself must adopt new attitudes toward preparation and employment. Parents, teachers, and counselors can help young people look realistically at school and work opportunities. All of us must share with youth the sense of pride and responsibility that comes from doing well even the simplest job.

Our recommendations highlight what needs to be done to bridge the gap between school and work for millions of maturing boys and girls. To be effective the recommendations should be implemented promptly and vigorously supported on a broad scale in every community, with the closest coordination between responsible agencies.

The challenge is urgent, the task is large, the time is now. The task cannot be delegated, and must not be sidestepped. Both public and private groups at every level—local, State, and Federal—must participate wholeheartedly and unselfishly to assure success.

Every citizen has a stake and a share in this responsibility—an obligation to see that today's youth meet tomorrow's destiny well-educated, well-trained, and well-equipped, ready and prepared for the world of work.

APPENDIX

Individual Committee members have submitted the following additional views. In several instances the members disagreed on specific recommendations or proposed additional recommendations; in others they differed on broader matters of viewpoint and approach.

Members' statements on specific recommendations appear first, followed by the more general comments.

RECOMMENDATION 1, regarding the establishment of State, city, or local commissions specifically charged with youth employment.

Statement by Dr. Howard Dawson, Executive Secretary Emeritus, Department of Rural Education, National Education Association:

"I suggest that Recommendation 1 be amended to read: We recommend that the governor of each State and the mayor of each city, **and the executive board or body of each of the other major units of local governments,** establish a continuing commission on youth affairs concerned with youth employment.

"The emphasized part of this sentence is the wording of the amendment.

"This amendment will provide for the units of local government not included in cities and also for the District of Columbia. Such units of government should also have a 'continuing commission on youth affairs.' "

RECOMMENDATION 6, on the need for a Federal program for urban and conservation employment and training of youth.

Statement by Eli E. Cohen, Executive Secretary, National Committee on Employment of Youth, New York, N.Y.; J. A. Beirne, President, Communications Workers of America, AFL-CIO, Washington, D.C.; Mrs. Mildred M. Jeffrey, Community Relations Director, United Automobile, Aerospace and Agricultural Implement Workers, AFL-CIO, Detroit, Mich.; Joseph Monserrat, Director, Migration Division, Puerto Rico Department of Labor, New York, N.Y.; and Whitney M. Young, Jr., Executive Director, National Urban League, New York, N.Y.:

"While we are gratified to find an overwhelming consensus among members of the Committee in favor of a Federal program for youth employment, we believe it would be more relevant to this Committee's activities to support specific legislation now before the Congress. For this reason, we would prefer to be recorded in favor of the program supported by the Administration and contained in Senate bill S. 1 and House bill H.R. 1890. We wish to emphasize that the need is too vast and critical to place a limit of $100,000,000 per year on the appropriation, or to suggest a demonstration approach."

Donald J. Hardenbrook, Chairman of the Board, National Association of Manufacturers, and Richard Wagner, Chairman of the Executive Committee, U.S. Chamber of Commerce, opposed Recommendation 6. Their dissents are included in their general reactions to the Committee report, and are expressed below under General Comments.

RECOMMENDATION 9, on the need for increased sources of financial support for the schools.

Statement by James F. Oates, Jr., President, Equitable Life Assurance Society of the United States, New York, N.Y.:

"In view of the complex and critical nature of the youth unemployment problem, and the mission of this committee to try to define and recommend broad courses of action to deal with it, we have been required to make many recommendations without detailed analyses of costs and the means available for meeting them.

"In the one case where we did propose a cost limit (of $100,000,000 per year for 3 years in Recommendation No. 6) we did so, in my judgment, to stress our conviction that the federally subsidized work experience approach should be limited and experimental until we have gained experience enough to evaluate its results, not because we felt competent to cost out such a program in detail. Furthermore, we were guided in our thinking respecting a financial limitation by the figures provided in the Administration bill considered by Congress last year.

"Detailed estimates of costs, together with the evaluation of the priority of the youth employment needs relative to other needs are, of course, essential prerequisites to undertaking the programs we have recommended. Federal, State and local governing bodies, together with the President, and State and local executives and administrators, will, of course, be in the best position to determine priorities and to take appropriate steps to keep the financial burden within prudent limits. I record here, however, my deep conviction that the youth employment needs should have an extremely high priority, and that they appear to me to justify substantial additional expenditures, hopefully counterbalanced by savings in areas where governmental assistance is less necessary."

RECOMMENDATION 13a, on revisions of child labor provisions in Federal and State laws.

Statement by Dr. Howard Dawson, Executive Secretary Emeritus, Department of Rural Education, National Education Association:

"I think this recommendation should be stricken, because I think it would be unwise to relax the standards it has taken so long to attain. I look askance upon opening the door to renewed exploitation of children in the labor market."

Statement by Cornelius J. Haggerty, President, Building and Construction Trades Department, AFL-CIO, Washington, D.C.:

"I most strenuously object to that section of the Report which would call for and encourage relaxation of the existing child labor laws. The trade union movement, since its very inception in this country, has devoted a great deal of its energies toward the abolition of child labor, and I fail to see how renewed exploitation of children to any degree would ever help solve the tremendous problem of youth employment which we have before us."

RECOMMENDATION 13c, on revision of the hazardous occupation provisions of the child labor laws.

Statement by Cornelius J. Haggerty, President, Building and Construction Trades Department, AFL-CIO, Washington, D.C.:

"I am further opposed to that section of the Report which would open the door to the employment of children in the hazardous occupations. We feel that the so-called hazardous occupation orders which restrict the employment of youth under 18 are presently inadequate, and rather than being relaxed should be strengthened and enforced for the ultimate protection of our youth."

Further recommendations by Mary Conway Kohler, Consultant on Youth Employment, New York, N.Y.

1. Employers, unions, the Government, and individuals must all examine their policies—as well as their consciences—to the end of furthering youth employment opportunities by eliminating such practices as: (a) overtime hours of employment; (b) moonlighting; (c) jobholding by pensioners.

As this Report has shown, a crisis exists today among our young people because of the serious lack of employment opportunities. Times of crisis require dramatic—sometimes painful—action. Therefore: (a) We call on employers and unions to reexamine policies and attitudes toward overtime. It is understandable that employers often prefer to schedule overtime rather than to hire extra workers. It is also understandable that employees seek to put in extra hours at increased pay. However, we are convinced that employers and workers alike will benefit in the long run from the greater economic stability and broader social cohesion that will logically follow an expansion of employment opportunities in our country. (b) We call on employers, unions, and Government to join together in a campaign to eradicate or substantially reduce the practice of moonlighting. Moonlighting (the holding of two jobs by one person at the same time) often involves—in the second or subsidiary job—the kind of low skill work that young people without special training can do; e.g., pumping gas, waiting on tables. By helping youngsters to gain a foothold on the job ladder, even at a low-skill, low-paid job, we are accomplishing more than merely providing them with an alternative to idleness. We are providing them with an incentive to seek further training and higher levels of employment. (c) In the same spirit and for substantially the same reasons, we call on pensioners with incomes sufficient to maintain themselves to withdraw from the kinds of employment that can be performed by untrained youngsters. And so long as it does not work undue economic hardship upon such persons, we ask that employers and unions encourage such withdrawal.

For these reasons we ask the affiliates of the AFL–CIO and the Chamber of Commerce, National Association of Manufacturers, trade associations, and other national employer groups to educate their membership to the ultimate danger to society of these practices.

2. That Government encourage the companies with which it does a substantial amount of business to carry on regular programs of apprenticeship as a means of providing more training and employment opportunities for young workers.

Many young people desiring to acquire a skill cannot find employers willing to provide them with traditional broad apprentice training. As a result, many youngsters who would prefer to be training for the jobs of the future are wasting their days in dead-end employment.

This is more than merely a personal problem, affecting only the young people concerned. It is a national problem. The continued strength and security of our country depend on a continuing supply of young men and women capable of building, operating, and repairing the complex equipment of a technological age. Therefore, the Government should require contractors for Government work to train apprentices in numbers that are in proportion to the dollar value of their contract. The total should be determined by the estimates of future needs made by the National Council on Apprenticeship Standards.

If necessary, a requirement of this kind should be enacted into law.

3. Youth employment counselors should, where practicable, be designated from the personnel of the 1,900 public employment offices of the State employment services affiliated with the United States Employment Service in the 50 States. They should receive special training to help them function as youth counselors.

Located as these offices are, they can become a strategic community resource in aiding young people in their transition from school to work. By establishing a close working relationship with guidance personnel of the schools they can better align school preparation with job placement conditions. They can work with employers, labor groups, and community agencies in helping adjust youth to labor market conditions.

GENERAL COMMENTS

Statement by Donald J. Hardenbrook, Chairman of the Board, National Association of Manufacturers, New York, N.Y.

"These separate views regarding the Report of the President's Committee on Youth Employment are directed more at its omissions than at its accomplishments.

"In our opinion, the Committee has failed to explore adequately the existing and potential barriers to the employment of youth and to indicate clearly the relationship between their recommendations and the removal of these obstructions. Further, the Report concentrates on improvement of the quality of the labor force, and makes no significant recommendations as to ways to increase the demand for younger workers.

"An example of the failure to distinguish carefully the causes of the problem is found in the introductory section of the Report. We are told, for example, that more than 600,000 young people are currently out of school and looking for jobs. No estimate is provided, however, as to whether their inability to find employment is related to an inadequate demand, to insufficient preparation or adaptability, to the wage structure, or to some combination of these factors. Without such an analysis it becomes impracticable, if not impossible, for the reader to evaluate the merits of the recommended programs.

"The second weakness in the Report is illustrated by the fact that although the President twice referred to the need for increasing the number of job opportunities for younger workers in his Economic Report, this Report gives no more than passing recognition to this aspect of the problem. At one point, for instance, the President said, 'Yet past experience tells us that only sustained major increases in production can reemploy the jobless members of today's labor force, create job opportunities for the 2 million young men and women entering the labor market each year, and produce new jobs as fast as technological change destroys old ones.' In another context the President said, 'Our need today, then, is . . . most important, by means of stronger markets and enlarged investment, to provide jobs for the unemployed and for the new workers streaming into the labor force during the sixties—and, closing the circle, the new jobholders will generate still larger markets and further investment.'

"The two weaknesses are, of course, closely related. A more careful delineation of the roots of the problem would have focused the attention of the Committee on the growth aspects. At the same time, failure to discuss this area in depth inevitably has the effect of casting doubt on the adequacy of the Report's conclusions as a solution to the problem being studied.

"In addition, we must request that we be specifically disassociated from the recommendation that 'A Federal program for urban and conservation employment and training of youth should be enacted promptly.' This recommendation is equivalent to a specific endorsement of the Youth Employment Act (S. 1 and H.R. 1890) which is currently before the Congress. We do not believe that it is appropriate for this Committee, which was established as a study group rather than a legislative committee, to take a position on specific legislative proposals. Secondly, the Committee has not made a particular study of this proposal and, as has been pointed out to the Committee, industry has, in the past, opposed both the establishment of the Youth Conservation Corps and the other proposals in this bill which appear to be closely related to programs of Federal aid to education.

"In another area, although the Report gave welcome emphasis to the need for action at the State and local levels, it is somewhat disturbing to note the frequent references to increased Federal funds for education which appear in the Report. In our view, education is a field that traditionally has been and is being well handled on the State and local level. Local school systems know and can satisfy the needs of their pupils better than any centralized authority. The proposals in this Report, in several instances, appear to be little more than a backdoor approach to Federal aid to education under the guise of offering a solution to the problem of unemployment among youth.

"Also, there appears to be a reasonable question as to whether the Report's analysis is adequate in this area and as to whether the link between education and employment is as simple

and direct as the Report implies. For example, the Council of Economic Advisers commented in its recent report that: 'The incidence of high unemployment has fallen most sharply on young persons newly entering the labor market. The inadequate rate of growth in job opportunities has resulted in new entrants encountering special difficulty in finding jobs despite their better educational qualifications. Though lacking in experience and specific skills, young entrants to the labor force are better educated than the average worker and significantly better educated than older workers retiring from the labor market. This has resulted in an increasing proportion of younger persons entering the white collar and more highly skilled occupations, but has not prevented a dramatic rise in the unemployment rate for the group as a whole.'

"Further, the Bureau of Labor Statistics study of 'Employment of High School Graduates and Dropouts in 1961' indicates that more than 70 percent of those who had left school earlier in the year, 1961, were employed by October of that year. This raises a very real question, which has not been explored, as to whether the failure of the remainder to find employment stemmed from the lack of a high school diploma or from some other reason.

"We might also note that the Report's recommendation that industry develop training programs for younger workers disregards the amount and value of training which is currently being provided for employees. Company training activities have grown over the years to major proportions and are being steadily expanded in keeping with the growth of individual firms. These programs are, of course, designed to improve the skills of younger workers as well as those of more experienced employees.

"On balance, however, the weaknesses of the Report appear to be related more to its failure to grapple with the reasons for youth unemployment than with the specifics of its positions. To a great extent, unemployment among youth is an integral part of the whole problem of unemployment in the economy, and this stems, in turn, from the need for a more vigorous rate of business growth. We have discussed what seem to be the underlying causes for the recent sluggishness in our economy at other points. It is sufficient for the purposes of this comment to point out that there appear to be three areas which hold especial promise in stimulating the growth of our economy. First, it would seem worthwhile to examine the relative positions of labor and management in the bargaining process with a view to limiting the undue preponderance of power which the law gives to labor unions at the present time. Secondly, there is widespread agreement as to the need for a thorough overhaul of our present tax system as a means of reducing the barriers to capital investment. Finally, there is a real need for improving the economic climate in which businessmen make their decisions.

"To sum up, then, we believe that there is agreement that unemployment among younger workers is at an unacceptably high level, and that an adequate program to correct this situation is one containing elements of two general approaches. One is to increase the level of training and awareness of employment opportunities among younger people. The other is to increase the total number of jobs in the economy. The Report dealt at some length with the first of these problems, but virtually ignored the second. As a result, the Report appears to be lacking in precision and depth in its analysis, and balance in its recommendations."

Statement by James F. Oates, Jr., President, Equitable Life Assurance Society of the United States, New York, N.Y., on relationship between minimum wages and youth employment.

"At the final meeting of the Committee, I submitted for consideration a relatively simple and brief recommendation, as follows: Any future consideration that may be given by the Federal Government or the States to increasing minimum wage standards should include a careful assessment of the potential effect on youth unemployment of any changes in minimum wages. From the decision not to include this statement, or one comparable to it, I must respectfully dissent because the relationship between further increases in minimum wages and youth unemployment should, in my judgment, be given the most thoughtful consideration by the appropriate authorities."

Statement by Richard Wagner, Chairman of the Executive Committee, Chamber of Commerce of the United States, Washington, D.C.

"The business community is and has been aware of the mounting unemployment among American youth and of the serious consequences of such unemployment. No other segment of the leadership of the Nation is more sincerely interested in or more earnestly seeking solutions to this aspect of the unemployment problem than business.

"Rapid changes in both industrial and marketing processes must be recognized to be both desirable and necessary. Hence, the development of American manpower must proceed in the light of such continuing changes within our economic system. Educational institutions, Government programs, and the legal structure surrounding the processes of human growth and development must be adapted to these changing demands on and for trained manpower.

"The President's Committee on Youth Employment will have served a worthy purpose if it calls to the attention of people in every State and community the critical need to press for such adaptations in their local and State educational and governmental processes relating to the development and employment of youth.

"The importance of the youth employment problem should not obscure the fact that comparatively little is known about many aspects of the problem. The research on employment opportunities and the potentiality of the unemployed (including the young unemployed) to be trained for such opportunities was the first order of business of the Manpower Development and Training Act under Title I. The President's Panel on Vocational Education quite clearly spelled out the need for modifications in our secondary schools in terms of noncollege-going youth.

"Much more information about both economic opportunities and human potentials to fill them is, in our opinion, prerequisite to effective local, State, or Federal action to resolve problems of youth unemployment. We must dissent, therefore, from the imperative tone of the Committee's report which presumes to stem from a documented certainty about effective solutions to fully described problems. No such documentation is presented. Furthermore, it is only a Committee assumption that such solutions, once identified, must be subsidized by the Federal Government in order to be activated.

"In this respect, the statements of the report suggesting Federal subsidization of made-work for youth must be recognized as nothing more than a holding process to get out-of-school, out-of-work youth off the streets of the cities.

"The only precedent for a Youth Conservation Corps stems from the much more serious unemployment problems of the depression 1930's—and even the CCC was recognized to be only a palliative. There is no comparable recession or probability of it today, and no comparable degree of unemployment. We therefore see no justification for proposing a comparable program and dissent from recommendation No. 6 to endorse a youth employment bill.

"Rather we would urge a fuller implementation of the research mandate given to the Department of Labor in Title I of the M.D. & T.A. and a modification of the Vocational Education Acts to bring vocational guidance and training programs presently subsidized by the Federal Government into line with available job opportunities in both trade and service occupations. Recent 'dropouts' might thus be encouraged to return to school and impending 'dropouts' prevented.

"Of the seven Committee 'recommendations for immediate action,' only four are believed to be based on adequate research and general in application and feasibility, namely the second, third, fourth, and fifth.

"The Governor's and mayor's commissions—first recommended—may be, under some conditions, an appropriate approach to increased employment of youth. However, most State and municipal executives already have at their disposal a variety of agencies, commissions, committees, or bureaus which could assemble and publicize facts about youth employment without establishing still another State or local commission. Executive prodding of existing agencies is needed and would be, in many cases, a sufficient action to recommend.

"The statement added to the second recommendation for 'the elimination of discrimination'

is but a sweeping generalization presented without documentary description of conditions to be corrected or means of doing so. Passage of the youth employment bill—the sixth recommendation—was flatly and unanimously rejected by the Board of Directors of the National Chamber at their meeting on January 25, 1963.

"The training allowances for dropouts, aged 16 to 19, under M.D. & T.A.—the seventh recommendation—we believe, would be an invitation for still further school leaving in the many communities where secondary schools are primarily oriented to college-going youth.

"The 'long-range' recommendations (8 to 15) of the Committee are generally well conceived in terms of increasing the jobs for youth and the readiness of youth for jobs. Here again, however, the Committee's recommendation for 'additional Federal aid to public schools' is devoid of justifying research about the need, purpose, or programs of such subsidies."

KENTUCKY

Information about admission, attendance, and certification requirements, housing facilities, and instructional programs is presented for the Kentucky Area Vocational-Technical Schools which have the purpose of preparing students for useful employment and increasing the knowledge and skills of employed workers. The schools serve all persons over 16 years of age who may profit from the instruction offered in preemployment, day trade preparatory, part-time and trade extension training programs. These programs of vocational-technical education are not offered in lieu of general academic education but to supplement and enhance it. Programs are administered by legally constituted state and local authorities with established student policies and general regulations. The University of Kentucky offers preservice and inservice teacher training programs to provide professional and technical preparation necessary to meet requirements for the yearly certificates, 4-year certificates, endorsement of regular high school certificates, and yearly special part-time certificates. The directory includes 14 schools which are strategically located in relation to geographic limitations and population centers. Each school offers a variety of courses to provide training for the major occupational fields in which the residents of the area are employed. Some of the 22 programs described are barbering, chef cooking, cosmetology, electronics, masonry, printing, tailoring, and welding. (HC)

Frankfort, Kentucky

FOREWORD

Kentucky's past economy has been based primarily upon agriculture. However, due to a centralized geographic location, an abundance of natural resources, and a surplus supply of manpower, the State is undergoing rapid changes and is making great strides toward industrialization. With the rapid development of industry within the State, many thousands of industrial and business jobs are being created. The increasing complexity of automation and technological advances are demanding more highly skilled employees who are better able to meet these changing needs. Programs for the training and retraining of industrial workers require critical evaluation and constant revision to keep pace with the changing technology for those who wish to avail themselves of the many opportunities in industrial occupations.

The State program of Vocational Industrial and Technical Education is an important means through which sound vocational training can be extended to an area beyond the boundaries of municipalities or districts. The area vocational schools, are strategically located in relation to geographic limitations and population centers. They aim to serve more adequately the needs of the increasing number of students, both youth and adults, who are constantly in need of adjustment to meet the demands of this age of changing social and economic conditions. Each area vocational school offers a variety of courses, broad enough in scope to provide training for the major occupational fields in which the residents of the area are engaged. Because they serve persons who need upgrading training as well as preparatory training for entrance into industrial and business occupations, these area schools are located mainly in urban centers made up of workers in industry and business.

With the increased emphasis upon a sound foundation in general education prior to specialization in a vocational or occupational pursuit, and with the increased age limitation at which a young adult may be employed, many of the more technical courses offered by the area vocational schools are rapidly becoming post-high school and adult programs. The area vocational schools operate as dual institutions in that they serve different groups of people. This is accomplished by providing services for high school students who can attend vocational shop classes a part of the school day while pursuing their regular high school programs. Under this plan the students may progress regularly toward high school graduation.

Other groups served under this plan are out-of-school youth and young adults who require coordinated training and work experience to fit them for useful employment. Employed workers who need organized instruction which will enable them to advance in their trade are also served through extension programs. Apprentices who need and must have planned instruction are served by part-time classes. At the end of the prescribed course of study, the student is awarded a certificate of completion.

GENERAL INFORMATION

The Division of Industrial and Technical Education through its system of Area Vocational Schools throughout the state offers a comprehensive program of full-time and part-time education of a nature that prepares people for entrance into industrial and technical occupations, or that enables those already employed to advance in their occupations. This educational program is designed to serve adults, regularly enrolled high school students, and out-of-school youth who need and desire specific vocational training and/or retraining for job advancement.

PURPOSE AND PHILOSOPHY

The controlling purpose of the Area Vocational-Technical Schools is to fit students for useful employment and to increase the knowledge and skills of employed workers. The vocational-technical education program gives purpose and meaning to education by relating academic work to a specific occupational goal. The curriculum is organized to give more than training for specific job skills—it develops abilities, understandings, attitudes, working habits, and appreciation which contribute to a satisfying and productive life.

The schools strive to provide a well-rounded program of studies aimed at developing competent workers, the ultimate goal of which is an American worker-citizen who is competent vocationally, economically, socially, emotionally, and physically.

The program of vocational-technical education in Kentucky is not offered in lieu of general academic education, but grows out of it, supplementing and enhancing it. Vocational-technical education is an integral part of the total education program. Both vocational-technical education and academic education programs are administered under the auspices of the legally constituted state and local authorities, who recognize their responsibilities for providing adequate educational opportunities for all people.

OBJECTIVES

Increase the performance skills, including those relating to safety and technical knowledge of persons already employed in industry, through extension or supplemental courses which will improve their job skills and give them additional technical information.

Develop basic manipulative skills, including those relating to safety, job judgment, technical knowledge and related industrial information that will best enable persons to secure employment and advance in skilled trades, industrial, technical, distributive, or practical nursing occupation.

TYPES OF PROGRAMS OFFERED

Pre-employment training: Out-of-school youth and adult students attend vocational classes and receive intensive training for entrance into employment in a specific industrial job or retraining the worker for a new position.

Day trade preparatory: High school students attend vocational classes a minimum of three clock hours daily to prepare for entrance into useful employment in an industrial occupation and at the same time continue their general academic courses leading to a high school diploma.

Part time: Students in school who are legally employed and working at least one-half time as learners in an industrial occupation. Part-time apprenticeship classes are organized by the area vocational schools in cooperation with the Apprentice Training Service to give the necessary related theory pertaining to the trade.

Trade Extension: Trade extension courses may be offered to employed persons desiring to be upgraded in their occupations.

POLICIES

ADMISSION PROCEDURE AND REQUIREMENTS

Students desiring admission to the Area Vocational-Technical Schools should obtain application blanks from the school of their choice, preferably in person. If this is not possible, application blanks will be mailed upon request. When an application is received and is found to contain all information requested, a tentative reservation is made for the applicant to appear at the school for pre-enrollment interview and guidance.

Enrollment in all classes is open to persons over 16 years of age who may profit from the instruction offered.

WHO MAY ENROLL

The Area Vocational-Technical Schools offer opportunities for vocational distributive, trade and industrial and technical education to the following groups of students:

High School Youth: High school youth who meet the entrance requirements of the Vocational-Technical Schools and are sent by local boards of education. High school credit is given by the high school enrolling the student and not by the Vocational Schools.

High School Graduates: An increasing number of high school graduates who wish to prepare for the skilled trades or to become technicians are taking advantage of the educational opportunities offered by the Area Vocational-Technical Schools.

Out-of-School Youth: Persons between 16 and 21 years of age who have completed or have dropped out of the regular school program.

Veterans: The Area Vocational-Technical Schools are approved for the education and training of veterans or eligible veterans' dependents.

Physically Handicapped Students: Physically handicapped people are admitted to the Area Vocational-Technical Schools. Kentucky, through the Bureau of Vocational Rehabilitation, gives financial assistance to physically handicapped people while attending the Area Vocational-Technical Schools.

Adults: Any adult who desires and can profit from the instruction given is eligible to enroll providing he can meet the standards established by the schools for enrollment.

CREDIT FOR PREVIOUS TRAINING

A student wishing to transfer from one vocational-technical school to another should complete the regular application for admission and present a transcript or certificate of work already completed. Evidence of satisfactory attendance and honorable dismissal will also be required.

Full credit for previous education and training may be given provided satisfactory progress has been made. Satisfactory progress means that the student will have progressed at an average rate of speed in the work completed at the former school. The schools reserve the right to evaluate previous training in keeping with their prescribed courses of study.

REGISTRATION

High school students who wish to attend a vocational school in their junior and senior years are registered at the time they complete their class schedule for high school registration.

Out-of-school youth and adults are registered on a continuous basis at any time during the school year.

WITHDRAWAL AND RE-ENTRANCE

If a student is dismissed because of unsatisfactory progress, he may be permitted to review the part of the course in which he did unsatisfactory work. Upon demonstrating his ability to successfully master the work, he may be permitted to continue.

CERTIFICATES

A certificate of completion is granted to students who successfully complete the prescribed course.

TUITION AND FEES

Tuition and fees are set by the State Board of Education. These fees are nominal and vary by types of students and courses pursued. Specific information should be obtained from the school to which application is made.

REFUND POLICY

Tuition refunds will be made on the basis of tuition paid, less days of enrollment. This policy may vary in different schools.

BOOKS AND SUPPLIES

Textbooks and other supplies are available to students at cost. These are obtainable through the school.

GENERAL REGULATIONS

CONDUCT

Students are required to maintain the customary rules of good conduct. They are considered mature individuals; their behavior, in school and out, is expected to be dignified and honorable.

ATTENDANCE POLICIES

Students are required to attend classes regularly with only emergency situations accepted in cases of absence. Unexcused absence will not be accepted and will result in dismissal.

RATING SYSTEM

Ratings are based on citizenship, including industry and cooperation, laboratory work, technical skill, related subjects, and attendance.

SPECIAL SERVICE AND FACILITIES

COUNSELING AND TESTING

The Area Vocational-Technical Schools conduct testing programs which enable the faculty counselor to assist students in making occupational choices.

The school programs are devised to prepare a student for a specific vocation. It is extremely important that the student, in so far as possible, make an intelligent choice based on his interest, abilities, and capacities. Students who find it difficult to make a vocational decision can make arrangements through the faculty counselors to visit and observe the courses in operation. They can also receive first hand information from the students and instructors.

Testing facilities are made available at the schools. Faculty counselors are available on a scheduled basis to administer interest inventories, aptitude tests, and test batteries which will give indications of probable success in the occupations covered by the school program.

STUDENT PLACEMENT

The placement of competent graduates in the occupations for which they have been trained is a paramount desire of the Area Vocational-Technical Schools. To this end these schools work constantly and cooperatively with industry and all governmental agencies concerned with employment and placement of workers in industry.

HOUSING FACILITIES

The Area Vocational-Technical Schools do not guarantee living quarters for out-of-town students. Assistance is given in every way possible in locating comfortable and convenient living accommodations. In some schools dormitory space is available.

APPLIED SUPPLEMENTAL SUBJECTS

In all schools required supplemental classes are given daily in Shop Sciences, Mathematics, Blueprint Reading, Sketching, and Safety for all full-time students. The work is organized on an individual basis with the intent of taking the student as far as possible in the time available.

PROGRAM OF TEACHER TRAINING

The University of Kentucky, Lexington, Kentucky, is the designated institution for teacher training. Other public institutions of higher learning may be designated by the State Board of Education as future needs may demand.

Both pre-service and in-service types of teacher training programs are conducted in residence or by extension through the approved teacher training institution and are carried out by means of a cooperative arrangement between industry, the Division of Trade and Industrial and Technical Education, and the designated teacher training institution. Such a plan provides for both professional and technical preparation necessary to meet certification requirements as established by the State Board of Education.

REGULATIONS GOVERNING ISSUANCE AND RENEWAL OF CERTIFICATES IN THE FIELD OF TRADE AND INDUSTRIAL EDUCATION (WHICH ALSO INCLUDES DIVERSIFIED OCCUPATIONS EDUCATION) AND DISTRIBUTIVE EDUCATION

1. **Issuance of Yearly Certificates**

   A certificate valid for one year shall be issued when the general requirements as set forth in the State Plan of Vocational Education in the field of trade and industrial and distributive education have been met and when the applicant has completed a course in theory, methods, and practices in teaching of vocational industrial education in high schools, trade schools, and area vocational schools. Such a course shall ordinarily be required prior to the time that a person begins his teaching; however, in the event he is employed during the school year and is unable to complete the course before beginning his teaching, this person shall successfully complete the course prior to the reissuance of the yearly certificate.

2. **Renewal of Yearly Certificates**

   The yearly certificate for full-time instructors may be renewed upon a full year of satisfactory teaching experience gained during the life of the certificate and upon completion of two semester hours in Trade and Industrial or Distributive Education earned in residence at a teacher training institution designated in the State Plan for Vocational Education as an approved institution for training Trade and Industrial or Distributive Education teachers. If the

applicant has not completed the course in theory, methods, and practices in teaching ordinarily required of all beginning teachers, this course must also be completed in addition to the year of experience before the renewal may be granted. If the applicant has already completed all course requirements for a certificate, experience only will be required for renewal.

3. **Issuance of Four-Year Certificates**

When a person has completed 4 semester hours in teacher training courses in Trade and Industrial or Distributive Education, if an undergraduate, or has completed 16 semester hours, if a graduate, and has served four years in a program of Trade and Industrial or Distributive Education, he may be issued a certificate valid for four years. Trade Analysis, Teaching Methods, and Principles and Philosophy of Vocational Education are required courses for all applicants. One half of the credits may be earned by extension or correspondence courses.

4. **Renewal of Four-Year Certificates**

This certificate may be renewed every four years upon three years of successful experience in a program of Trade and Industrial or Distributive Education operated under the State Plan for Vocational Education, provided the applicant can show that he has kept abreast of modern practices in the trade and distributive subjects he is teaching and has taken special courses when requested to do so by the Director of Trade and Industrial and Distributive Education. It may also be renewed upon completion of one-half year of additional college work. One half of the college work should be in Vocational Education.

5. **Endorsement of Regular High School Certificates for Vocational Subjects**

When requirements have been met for the issuance or renewal of a one-year or a four-year certificate in the field of Trade and Industrial and Distributive Education, a holder of a high school certificate may have that certificate validated for the same subject and for the same length of time

as provided for under regulations for issuance or renewal of the certificate for Trade and Industrial or Distributive Education.

6. **Issuance of Yearly Special Part-Time Certificate**

A special certificate, valid for one year and for teaching part-time and extension classes in the field of trade and distributive occupations in the subject stated on the face of the certificate, may be issued provided (1) that the applicant has at least three full years of experience of journeyman grade in a recognized trade or three years of successful experience in a distributive occupation and (2) that the applicant is to be employed in a program of Vocational Trade and Industrial or Distributive Education sponsored by the public school system in accordance with the State Plan for Vocational Education.

The yearly certificate for part-time instructors may be renewed upon evidence of successful teaching in a part-time course during the school year for which the certificate is valid. Persons who do not meet renewal requirements of the certificate may be issued a new certificate upon application.

Note: These regulations are subject to change at any time by the State Board of Education.

AUTO BODY REPAIR AND REFINISHING

Each Repair Job Requires a Separate Analysis

The smooth flowing lines of the modern automobile are an auto body repairman's dream. Once these contours are damaged, the services of a highly skilled auto body mechanic are required.

Auto body mechanics enjoy steady work at a relatively high rate of pay. The skilled man will find it easy to go into business for himself after a few years of experience in a well organized shop.

In the Area Vocational School, instruction is given on body and fender repairs extending from small dents to complete rebuilding of wrecked or damaged automobiles. Students are carefully supervised in all phases of the work. Finished jobs must adhere to commercial standards.

The auto body training includes welding, grinding, assembling, straightening, alignment, painting, salvage, estimating and shop operation. Many students elect to specialize in either metal working or painting.

Shops in the area vocational schools are well equipped with modern tools of the trade. Success in this line of work is largely dependent on the skill, knowledge, and resourcefulness of the individual student.

Training in Auto Body Mechanics provides an ample return for time and money spent, and students who apply themselves are usually rewarded with immediate employment.

Basic Course Outline for AUTO BODY MECHANICS
Course Length—22 Months

Auto Body Painting
- Cleaning, sanding and repairing rust spots
- Masking and spraying
- Rolling and polishing finish coats of lacquer
- Patch, repair and paint blending

Auto Chassis
- Front end alignment
- Frame straightening
- Radiator repair

Auto Body Repair
- Welding, brazing, grinding and sanding
- Solder—spraying and torch
- Patching
- Removing dents
- Body alignment
- Paneling

Trimming
- Chrome trim
- Installing locks and glass
- Upholstery and trim

AUTO MECHANICS

Motor Overhaul—A Major Phase of the Auto Mechanic's Training

Millions of new cars are produced every year and each one will need the services of a skilled mechanic on several occasions before its useful life is ended.

Increased use of the automobile, coupled with its intricate mechanisms, has taken the repair job away from the "do-it-yourself" mechanic. The skilled auto mechanic has become an important person on the American scene.

In the Area Vocational School, students are given practical experience on live jobs, concurrently with technical information on how each sub-assembly works, and how it may best be repaired. Use of trade manuals, specification charts, circuit tracing, and a working knowledge of parts and repair manuals are a part of every repair job.

Carefully supervised instruction is given on diagnosis of faults and analysis of repair procedures. This entails complete training on electrical, cooling, ignition, and braking systems.

Special emphasis is given to automatic transmissions and the common ills of high compression engines. Film strips, moving pictures, charts, mock-ups, as well as real jobs, provide opportunities to develop skills and knowledges that enable the student to enter and progress on the job by himself at the end of his training period. Equipment is modern and complete so that transition from the school shop is an easy step.

Students who can analyze, diagnose, and produce in the shop usually find ready employment.

Basic Course Outline for AUTO MECHANICS
Course Length—22 Months

Tools and Equipment
Engine—Operation, Maintenance, and Repair
Clutch—Operation, Maintenance, and Repair
Transmission—Operation, Maintenance, and Repair
Chassis—Construction and Maintenance
Brakes—Operation, Maintenance, and Repair
Steering Systems
Front End Axle Systems—Operation, Maintenance, and Repair
Cooling Systems
Electrical Systems
Fuel Systems
Differentials
Universal Joints and Drive Shafts
Body and Accessories

BARBERING

Both Men and Women Train for a Career in Barbering

We commonly think of barbering more specifically as the art of cutting hair; however, much more is included in this modern day service occupation. Skills today include scientific methods of shaving and hair cutting, facials and scalp massage, treatments with oils, creams, lotions, or other preparations, either by hand or mechanical appliances. Also included are such services as singeing, shampooing, arranging, dressing, dyeing or applying tonics to the hair. The application of cosmetics, preparations, oils, powders, clay or lotions, to the scalp, face, neck or upper part of the body is likewise a vital part of the training. Sterilization and sanitation are empahsized throughout the training period in the Area Vocational School.

The Kentucky State Board of Barber and Beautician Examiners require all who enter the course to be at least 16½ years of age and to have completed at least two years of high school. At the end of the course, which requires a minimum of 1,500 clock hours, the student is required to pass an apprentice examination and work as such for one year. At the termination of the apprenticeship period the student may take an examination for a Master Barber's License.

Basic Course Outline for Barbering

Course Length—1500 Hours

Practical Instruction:

History, Professional Ethics, and Shop Management
Use of Barbering Implements
Care and Maintenance of Tools
Technique of Practical Barbering
Application of Tonics, Creams, and Lotions
Shaving
Haircutting
Massaging
Facials (with and without lights)
Champooing
Scalp Treatments (with and without lights)
Hair Coloring

Science:

Bacteriology
Sterilization and Sanitation
Hygiene
Skin and Scalp Disorders
Anatomy and Physiology
Electricity
Light Therapy (as applied to barbering)
Chemistry and Pharmacology
Psychology

CARPENTRY

Mock-ups Serve As Live Training Aids Prior to On-the-Job Experiences

Nearly a million homes have been built in our country each year since the end of World War II. The demand and opportunities for tradesmen in the field of woodworking and carpentry are constantly on the increase. Skill in the art of woodworking lends itself readily to the performance of a multitude of necessary and worth-while jobs for the homes and for many activities of modern life.

In this course the student is taught to work from blueprints and specifications, to operate power tools necessary for the building trades, and the use of smaller portable tools in the finer work of trimming and installing built-in features of the modern home and office. Special emphasis is placed on the proper technique so the learner may understand and become acquainted with generally accepted carpentry practices as required to build substantial frame

residences that combine good construction, good design, efficient floor plans, and the use of proper building materials.

Woodworking and carpentry offer a rich variety of experiences and great opportunities for those who acquire knowledge and skills of the trade. Graduates who show initiative and ability are often promoted to foremen or supervisors, or they may become contractors or operators of their own production shops.

Basic Course Outline for CARPENTRY
Course Length—22 Months

Building Layout and Concrete Form Construction
- Layout of Building Lines
- Building Footing and Foundation Wall Forms
- Building Forms for Concrete Steps

Framing and Sheathing
- Floor Framing
- Wall Framing and Sheathing
- Roof Framing
- Special Framing Problems

Exterior Trim
- Cornices

CHEF COOKING

More than 75 million Americans eat daily in commercial establishments. With air travel an increasing means of transportation; resort spots of the world expanding at unprecedented rates; tourist sites, motels, and "drive-ins" dotting the horizon for the motor-minded millions; with "in-plant" feeding and "on location" catering necessary to America's industrial way of life—commercial cooking has become a highly desirable trade, challenging the ambitious young man or woman.

Hors d' Oeuvres . . . Plat du Jour . . . Wiener Schnitzel a la Holstein . . . Pompano en Papillote—these and thousands of other words having culinary connotation are transformed into basic operations and skills in the everyday life of the commercial food handler.

There is very little unemployment for those trained in this field. Trained food handlers find numerous opportunities for advancement as caterers, bakers, chef cooks, waiters, or waitresses.

Almost without exception, our future restaurant managers and operators will be persons who have at one time or another availed themselves of the advantages of formal training.

In the Area Vocational School, the student is given the basic essentials of the trade through practice in meat cutting, quantity cooking, custom baking, catering, and serving.

Many graduates of food trade courses have in a short time risen to managerial positions with leading catering operations.

CONSTRUCTION EQUIPMENT OPERATION AND MAINTENANCE

In man's efforts to create an environment according to his desire and needs, heavy equipment is one of his indispensable tools. Creating roads over the mountains, transforming swamps into building sites, erecting and swinging tons of steel with a flick of a finger, moving yards of earth in minutes, fitting precisely ground parts together in a machine, and operating a machine so rugged that giant trees will topple in its path are the thrilling life and work of a heavy equipment mechanic and operator.

The heavy equipment mechanic and operator can expect to be in the open spaces with an industry that is humming with activity. Road and dam building projects are pyramiding with long range planning which assures a steady demand for those with the necessary skills. Opportunities are almost unlimited, ranging from dozer and shovel men for strip and auger mines to crane operators and mechanics in mills and plants. All major earth moving projects require heavy equipment mechanics and operators.

Efficient mechanics and operators in this field must acquire considerable technical knowledge. Good mechanical aptitude is essential to properly apply the technical knowledge to its practical application. One should have, or acquire, sufficient education to read and understand technical descriptions and diagrams.

Units of instruction in this course cover such areas as ignition, cooling systems, fuel systems, clutches, steering, chassis, lubrication, transmissions, engines, differentials, and brakes in the mechanical field. As an operator, one must master the operation of such machines as dozers, shovels, cranes, graders, clam shells, drag lines, dump trucks, tractor-trailer units, pans, loaders, and turnapulls. Technical information and related subjects are made available in the classroom. Live jobs are utilized to the greatest practical extent.

The heavy equipment mechanic and operator gives routine maintenance as well as makes major repairs on gasoline and diesel machinery. He works with huge castings and very small, precisely ground parts. He repairs and operates electrical, hydraulic, and mechanical machinery requiring extensive technical knowledge, ingenuity, and skill. His associates range from engineers to laborers.

COSMETOLOGY

Personal beauty service is recognized as a necessity by most women today. Performance of this service can be satisfactorily rendered only by the operators who possess the skills and knowledges of the trade, and who are adept at social courtesies. Many advanced high school students, men and women, have completed the course and are now profitably employed in shops throughout Kentucky.

To be eligible for the course in Beauty Culture, one must have completed two years of high school and be at least 16 years of age. A state registration is required for apprentices and the examination is open to all who have completed 1500 clock hours in the study of physiology, chemistry, and other technical information pertaining to the trade. This study is accomplished by training and practical experience in accepted practices relative to hair, skin, scalp, and nails.

A year of successful operation as an apprentice qualifies the person for the final examination to an operator's license.

DRAFTING AND DESIGN

The Draftsman Must Visualize the Finished Product

Drafting is the universal language of industry understood around the world. Few of us stop to realize that almost everything manufactured in modern industry, at some phase, appeared on the drafting board. Not only is this true of new products, but even the best and most advanced machine is being studied and redesigned for better or more efficient operation. A major part of that study and design is being done by the technical draftsman.

There are unlimited opportunities available to the person who wishes to pursue this occupation. A person with ideas, imagination, and intelligence may find that the drawing board affords an outlet for original thinking. "Want ads" in daily newspapers indicate industry's overwhelming demand for qualified draftsmen.

Instruction in fundamentals may include units in machine, architectural, aeronautical, and topographical drafting, as well as problems in industrial illustrating, and civil and municipal planning. Particular emphasis is placed upon speed, accuracy, and neatness. It is desirable that a student considering technical drafting have a

strong background in mathematics and science. The student's instruction in related subjects will not only include units in science and mathematics, but may include instruction in human relations, job interviews and placement, and other similar units. The student works on real jobs brought into the classroom, as well as problems from reference texts. The technical drafting student should be prepared to study for at least two years. Instruction is provided by men who are familiar with methods and techniques used by modern industry.

The field of drafting offers employment in an interesting and challenging occupation, with advancements limited only by the desire, ability, and ambition of the draftsman.

ELECTRICITY

Electricity benefits everyone in one way or another. It may cook our meals, heat our homes, pump our water, freeze our foods, cut our grass, wash our clothes, and furnish power for modern industry. The need for electricity increases at a staggering rate. Employment possibilities in the future appear to be exceedingly good for the trained electrical worker.

The Area Vocational Schools of Kentucky offer the individual an opportunity to become occupationally competent in many electrical fields. Live jobs in the trade consume the student's training time while in school. Related instruction is given throughout the course in the form of mathematics, physics, sketching, and trade theory from selected references and texts.

Electricity is a broad field and offers varied types of employment opportunities. Areas covered in the course of study include motor winding and repair, appliance repair, residential and farmstead wiring, industrial wiring, bell and signal wiring, lineman training, industrial electronics, and equipment maintenance.

Expert Motor Rewinding Renews Power

Basic Course Outline for ELECTRICITY
Course Length—22 Mos.

Fundamentals of Electricity

Construction Wiring

Interior Electrical Wiring—Residential

- Electrical fundamentals applying to wiring
- Cable wiring
- Wiring electric ranges and water heating appliances
- Residential furnace controls
- Remote control wiring

Interior Electrical Wiring—Industrial

- Industrial methods
- Non-residential lighting
- Wiring for motors
- Power and feeder service
- Transformers, capacitors, industrial power distribution
- Special circuits and application

Motor Repair

- Split phase motors
- Capacitor motors
- Repulsion type motors
- Polyphase motors

ELECTRONICS

The sky is the limit on career opportunities in the Industrial Electronics field for those who are willing to study and apply themselves.

The electronics industry is a rapidly expanding occupational field. Technicians who design, build, service, and trouble-shoot electronics equipment have available to them a wide variety of employment opportunities throughout the nation.

The variety of work and excellent opportunities for advancement, plus a high rate of pay, make employment in this field very attractive.

Those who wish to prepare themselves for this trade should have at least a high school education and possess an aptitude for the work. Major units of instruction involve fundamentals of electricity, bell and signal circuits, industrial electronics, switchboards, A. C. motors, D. C. motors, generators, D. C. and A. C. controllers, transformers, fundamentals of electronics, electronic measuring instruments, industrial electronic controls and devices, technical mathematics, technical science, and related subjects.

The electronics departments in area vocational schools are equipped with tools and testing equipment necessary for thorough instruction. Individual work stations, and areas for group instruction and demonstrations, are provided. Teaching methods include group instruction as well as individual instruction based on the progress of the individual.

Basic Course Outline for INDUSTRIAL ELECTRONICS

Course Length—22 Mos.

Electric and Electronic Fundamentals
- DC Components and Circuits
- AC Components and Circuits
- Fundamentals of Electronics

Basic Electronic Systems
- Power Supplies
- Audio Amplifiers
- Transmitters, A.M.
- Radio Receivers
- Antennas
- Frequency Modulation
- Laboratory Reports

Advance Electronic Systems
- Time Constants
- Radar
- Synchros
- Microwave
- Ultrasonics
- Computer Technology
- Television

- Mechanical Laboratory

MACHINE SHOP PRACTICE

"Take .015 of an Inch on the Next Cut"

We are living in a highly mechanical age. Practically everything is done with the push of a button or the flick of a lever. These ingenious mechanical and electronic devices are built of accurately and carefully made parts. Basically, the machinist is the key to all trades. His job is so essential to everyday life that his mark is on every phase of industry. The machinist plays a very important part in manufacturing because it is he who translates the ideas of the designer and inventor into practical and efficient machinery. The machinist fabricates, repairs, or makes parts for every conceivable piece of equipment used by modern manufacturing plants. The machinist trade takes on added importance in this world of science and invention and will continue to do so as long as science and industry continue to grow. This occupation represents the largest single group of skilled jobs in manufacturing.

Employment in this trade is found in every section of the country. The work of a machinist is becoming more important

and exacting as close tolerances are created in manufacturing satellites, rockets, and atomic devices. Most machinists work in modern surroundings with modern equipment, and receive a salary commensurate to those paid in the highest skilled occupations.

Those desiring to become machinists should possess, or develop, a thorough understanding of basic mathematics, physics, and science. They should also have a somewhat above-average mechanical aptitude by virtue of the fact that the greater percentage of a machinist's work is done with precision tools such as the engine lathe, turret lathe, grinders of all types, planers, shapers, milling machines, etc. In addition, all types of precision measuring instruments must be utilized.

Basic Course Outline for MACHINE SHOP

Course Length—22 Mos.

Bench Work	Planing
Lathe Work	Grinding
Drill Press Work	General Maintenance and Repair
Milling	Heat Treating
Shaping	Related Subjects

MASONRY

Learning to Trowel Is a Key Mystery of the Trade

Masonry, in the field of building construction, is as old as civilization itself. Recent statistics indicate a great demand for skillful, intelligent, and energetic men who are interested in masonry as a phase of building construction.

This course, requiring mental as well as manipulative skill, gives the student a general understanding of brick and stone work as it is applied to the building trades. Not only are the necessary trade procedures taught and emphasized, but sufficient practical experience and related information are included to provide understandings of structural design and construction.

Included in the course are such trade procedures as design and construction of footings, foundations and waterproofing, beams and lintels and their uses, walls and partition construction, chimney and fireplace design and construction. General knowledge of the use and application of glass brick and concrete block in masonry construction is also included.

During these years of rapid expansion, our progress in building residential, industrial, and defense structures continues to increase. Masonry represents one of the finest aspects of our culture in the building trades. Perhaps no other worker reaps so much satisfaction from his labors as the skilled craftsman who combines grace, beauty, and security in buildings for tomorrow.

Basic Course Outline for MASONRY
Course Length—22 Mos.

Building Footings
Laying Bricks
Laying Blocks
Laying Stone
Laying Tile
Pointing Up
Fireplace Construction
Lining Flues
Layout
Estimating

OFFICE MACHINE REPAIR AND MAINTENANCE

Office Equipment Requires Repair As Well As Preventive Maintenance

Office automation has given a new prominence to the work of the office machine repairman. The need for skilled workmen in this area grows each day as offices consign more of their routine chores to machines, and as manufacturers build new kinds and types of office equipment to perform repetitive tasks.

Skill and technical know-how are requirements of the trade as the repairman arranges and adjusts the modern typewriter which is composed of more than 2,000 component parts. Specialized skill in the use of tools, technical manuals, and test equipment is learned through carefully planned shop and class work centered around all types of office equipment.

Students receive practical experience in repairing typewriters, adding machines, comptometers, calculators, and duplicating equipment of all makes and models. Experience extends from simple adjustments to major overhaul and rebuilding.

Many graduates have successfully set up their own shops and are operating profitable businesses. Students enrolled in this course often secure a promise of employment several weeks before training is completed. Many physically handicapped people have been successfully trained in this course.

Basic Course Outline for OFFICE MACHINE REPAIR
Course Length—22 Mos.

Typewriters
- Dismantling
- Main Frame Servicing
- Segment Servicing
- Main Carriage Servicing
- Main Spring and Related Parts Servicing

Adding Machines
- Dismantling
- Main Carriage Servicing

PRACTICAL NURSING

There is opportunity in Kentucky for both men and women to become valuable members of the health team. A graduate of one of the approved schools of practical nursing plays an important part in providing adequate nursing care for the community, in hospitals, clinics, private homes, industries, doctors' offices and public health agencies, under the supervision of a licensed physician or a registered professional nurse.

Students must be at least seventeen years of age and have successfully completed one year of high school or its equivalent. They must have evidence of good health as shown by a physical examination.

The one-year program of instruction emphasizes gaining basic knowledge and developing attitudes and skills through instruction and carefully planned supervised practical experience.

All students have experiences in the following patient areas of an accredited hospital: medical, surgical, obstetrical (mothers and newborn babies), pediatrics (children), and care of the aged. Many of the students receive additional nursing experiences in such special areas as tuberculosis and psychiatry. Graduates of the course are eligible to take the examination to become Licensed Practical Nurses.

Practical nursing offers a career of achievement and satisfaction. It represents an inspiring opportunity to contribute to the welfare of mankind.

Basic Course Outline for PRACTICAL NURSING
Course Length—12 Months

Planned Instruction
- Anatomy and Physiology
- Personal and Vocational Relationships
- Community Health
- Nutrition
- Dosage and Medications
- Introduction to Conditions of Illness
- Nursing Arts

Supervised Nursing Practice
- Medical Nursing
- Surgical Nursing
- Obstetrical Nursing
- Pediatric Nursing
- Long Term Illness Nursing

PRINTING

The modern way of living would be a thing of the past if we should suddenly find ourselves without the printing trade.

In the wealth of printed matter about us, it is hard to conceive of trying to record for future reference or generations, the happenings of today by a means other than printing.

The printed word, today's newspaper, the Bible on the pulpit, and even this booklet are accumulations resulting from Gutenberg's humble beginning.

Today's printers number in thousands, while each new year introduces revolutionary processes and procedures that open thousands of additional jobs.

The student, having learned the basic skills required, can branch out into almost a hundred facets of the Graphic Arts industry, letter-press work, lithography, engraving, bookbinding, and many others. Seasonal work is unknown to the printer; a never-

ending stream of circulars, newspapers, periodicals, signs, posters, can labels, and thousands of other printed products roll off the printer's presses daily.

A printer should have a substantial background in English, spelling, mathematics, and an interest in the trade. Many handicapped persons are ideal employees in certain phases of the printing industry.

In this course the student learns to perform the basic operations of type setting and presswork, methods used in printing books, magazines, and newspapers in addition to the operation of the various machines used in the printing industry.

Basic Course Outline for PRINTING

Course Length—22 Mos.

Hand Composition
Machine Composition
Store Work
Platen Press
Proof Reading
Layout and Design
Cylinder Press
Type Styles and Faces
Stockroom
Paper-Cutting
Bindery Work
Ink Mixing and Composition
Maintenance and Repair of Printing Equipment

RADIO AND TELEVISION MAINTENANCE AND REPAIR

Up-To-Date Service Manuals Are Tools-In-Trade Of The Radio and T. V. Repairman

The terrific growth of the television industry and the development of color television and transistor sets have greatly increased the demand for well-trained television technicians. Color may even replace our black and white system. As future developments result in greater use of electronic equipment, this interesting field of work will offer an even greater variety of opportunities.

Television screens for face-to-face telephone conversations could become a reality in a few years.

In this course, actual television and radio repair work is performed as a basis for realistic instruction in the proper use of the television and radio test equipment. Other instruction includes the study of sound and wave motion, light, color, and electricity. Related mathematics is also offered for students who may need help in this field.

A good television and radio serviceman can find employment in most localities. Many television and radio repairmen become television and radio dealers and operate their own businesses.

Upon successful completion of this course, the student will have the technical knowledge and skill necessary for a bright future in the television and radio industry.

Basic Course Outline for RADIO AND TELEVISION

Course Length—22 Mos.

Safety

REFRIGERATION AND AIR CONDITIONING MECHANICS

Refrigeration and air conditioning, as applied in modern day living, afford unlimited opportunity to the individual who likes the challenge of something new and a profitable vocation. To apply this trade, one must have an aptitude for mechanics and an understanding of the laws of physics as they apply to pressures. A knowledge of simple uses of electricity, ability to calculate simple formulas of physics and mathematics, and a knowledge of blueprint reading are highly helpful.

Instruction in refrigeration and air conditioning deals with the fundamentals of theory and the applications of theory in actual practice. This course has enabled many to secure interesting and profitable employment.

The Principles of Refrigeration Are More Easily Understood Through the Use of Live Demonstration Panels

Basic Course Outline for REFRIGERATION AND AIR CONDITIONING

Course Length—22 Mos.

Refrigeration Theory
Mathematics, Science, Tests, and Reviews
Refrigerants
Tubing
Refrigeration Compressors
Standard Components, Assembly, and Construction
Refrigeration Controls
Valves
Multiple Systems
Repair and Trouble Shooting
Designing and Constructing Systems
Air Conditioning Principles and Theory

Air Conditioning Compressors
Air Conditioning Controls
Motors and Electrical Circuits
Air Conditioning Repair and Trouble Shooting
Instruments and Measurements

SHEET METAL

Many Parts of Sheet-Metal Projects Must be Bent and Formed to Make a Hem or Stiffen an Edge

Industrial developments and public demand for modern conveniences have made sheet metal work indispensable. Statistics show that of every ten persons gainfully employed in the United States, one is an employee in some capacity in the metal working industry.

The worker in this trade makes and repairs many things; such as, stove and furnace pipes, furnaces, air conditioners, signs, eave troughs, metal roofs and ceilings, metal doors and windows, automobile and airplane bodies.

Sheet metal, in many instances, is now used instead of wood and other industrial materials. These products are used on the farm, in the home, offices, and shops. The number of articles which can be made from sheet metal is limited only by the worker's own ingenuity, imagination, and resourcefulness.

In this course, the student learns to rivet, solder, cut, drill,

The Building of Sheet Metal Duct Work Assumes New Importance in the Era of Central Heating and Air Conditioning

roll, bend, and weld. He also learns the working characteristics of individual metals and the purposes for which each is best suited.

Basic Course Outline for SHEET METAL

Course Length—22 Mos.

Uses of Sheet Metals	Sizing
Geometric Developments	Calculations for Air Changing
Duct Work	Methods of Heating
Methods of Fastening	Methods of Cooling
Layout Work	Molding and Guttering
	Estimating

TAILORING

"Dress up, look well, and feel better" is the slogan being used by the clothing industry. Become a tailor and make this slogan a reality by helping to clothe America.

The tailor should have a knowledge of the latest styles at all times. When new styles are introduced, he should be one of the first to know, and he should be familiar with the many types of clothing and fabrics being used.

Before entering the field of tailoring, a high school education is important. Opportunities are greater for those who meet these qualifications.

Some of the basic units taught in tailoring are: Fabrics and their construction, designing, cutting, hand stitching, trouser making, and skirt and coat making. In this field, like other fields, there are specialists, who may, if they so desire, specialize in one or more of the areas.

There is a great demand for well-trained tailors. The opportunities are great as a small business, a big business, and in self-employment as well. The working conditions are desirable, the hours are good and pay is equitable.

Basic Course Outline for TAILORING

Course Length—22 Mos.

Tools and Equipment
- Opening, closing, and threading machine
- Using and caring for seam gauge machine
- Regulating tension and length of stitch
- Using a seam presser, binder, tailor's chalk, and pounding block

Seams—Types and Uses
- Making and finishing plain seams
- Staggering seam edges
- Making French, lapped or flat felt seams
- Making corded seams
- Binding Seams

Fitting Garments
- Fitting skirt and blouse
- Fitting ready made garments

Stitching Garments
- Stay stitching
- Machine and hand basting
- Stitching and pressing darts
- Stitching for gathering

Pockets, Hems and Other Finishes
- Making and attaching patch pockets
- Making set-in and/or slash pockets
- Putting in a straight hem
- Machine and hand hemming
- Applying hemming tape

Pattern, Marking and Cutting Garments
- Selecting a pattern-size, etc.
- Changing pattern sizes
- Marking and using tracing wheel and tailor's chalk
- Using pattern layout for cutting
- Cutting figured patterns
- Cutting napped or striped materials

Garment Construction — Trousers, Vests, Coats
- Straight seaming
- Neck and sleeve finishes
- Facings and interfacings
- Linings

TOOL AND DIE MAKING

Precision and Skill are Musts for the Die Maker

A journeyman in the trade of Tool and Die Making is highly skilled in the use of precision machines and instruments for building intricate mechanisms. This type of work is highly specialized and forms the basis of production as well as the quality of the products manufactured.

Tool and Die Making encompasses the building of tools, jigs, and fixtures, dies, gauges and special productive mechanisms. Knowledge of metallurgy and the heat treatment of various metals are used extensively by the die maker.

For those entering this highly specialized field, a high school education, or the equivalent, is essential. This is particularly true since the course of instruction requires a broad knowledge of mathematics, drafting and blueprint reading, physics, and science of metallurgy.

Opportunities in this occupation are practically unlimited for those posesssing the skills and knowledges required of successful workers in this field.

No Short-Cuts in this Highly Skilled Occupation

Basic Course Outline for TOOL AND DIE MAKING
Course Length—11 Mos.

Introduction
- Mechanical Drawing
- Free Hand Sketching
- Materials anl Heat Treatment
- Tool Design
- Tool Assembly Drawings
- Fixed Gauges
- Cutting Die Design
- Forming Die Design
- Multiple Operation Dies
- Bench Work

Machine Operations
- Drill Press
- Lathe
- Shaper
- Mill
- Planer

Press Operations
- Punching
- Blanking
- Forming
- Broaching
- Shearing

WELDING

Welding can be found in every phase of industry today. On-the-job construction, metal and steel fabrication, and maintenance work provide ample opportunities for the craftsman skilled in welding. It is perhaps one of the greatest contributors to our mass production superiority, and the field is expanding as rapidly as competent welders can be found.

The development of new metals and methods of fabrication and construction make it necessary for the welder to have a broad background of the basic knowledges and skills. To be a successful welder the operator must have a good basic understanding of the properties and characteristics of metals. New welding processes have been developed which call for a high degree of technical knowledge and operative skills. The trade calls for a mechanical aptitude and interest, with special emphasis on peculiar aspects of welding as related to the other trades. Educational and occupational experiences have shown that the welding student benefits by having previously had general science, general mathematics, and some experience in the field of metals.

The course of instruction in oxy-acetylene and electric arc welding is based on a study of the welding industry with particular emphasis upon the requirements of the commercial metal shops. Starting with the groundwork of fundamentals, the student learns the welding equipment and its uses, the character of the flame, and

the techniques of the method of application. Instruction includes both the flame and electric processes. Emphasis is placed on the proper techniques in welding in order that the learner may understand and practice correct welding procedures. The student learns the various methods of fabricating and assembling metal so that he may acquire sufficient knowledge and manipulative skills to prepare him to enter any one of the several metal trades. A great portion of the class instruction is given on actual productions jobs.

Through the development of the art of welding we now have all-steel bodies for automobiles, metal trains, bridges, buildings, boats, and innumerable other articles of all metal welded construction. In this modern steel age there is much in our high standard of living that we owe to the indispensable process of welding.

There is an ever constant demand for welders in all industries, and the expansion of modern industry will assure the trained individual regular employment.

Basic Course Outline for WELDING

Course Length—11 Mos.

Oxy-acetylene Cutting
- Layout Work
- Hand and Machine Cutting
- Grinding, Polishing, Shaping and Filing

Oxy-acetylene Welding
- Flat Welding
- Horizontal Welding
- Brazing
- Maintenance Welding
- Hard-Surfacing
- Overhead Welding
- Pipe Welding
- Testing

Electric Welding
- Flat Welding
- Horizontal Welding
- Vertical Welding
- Overhead Welding
- Cast Iron Welding
- Hard-Surfacing
- Pipe Welding
- Heat Treating
- Tempering
- Testing

Heliarc and Aircomatic Welding
- Aluminum and Hard Facing Alloys
- Mild Steel, Stainless and Alloys
- Copper, Brass, and Bronze

PUBLIC SERVICE OCCUPATIONS
FIREMEN TRAINING

The program of itinerant instruction operated by the Division of Trade and Industrial Education provides training of an extensive nature to local fire departments throughout the state. These services are provided by two full-time itinerant instructors on the state staff and coordinated with and supplemented by part-time staff members employed by the vocational school serving the area. These courses are provided by offering a series of units ranging from basic fundamentals to advance methods of firefighting to local fire department personnel. Each unit consists of twenty hours of instruction, and as many of the units may be offered as a department feels it has need of at a given time.

JOB SAFETY TRAINING
PUBLIC UTILITIES

"Hot Stick" School in Process

The rapid expansion of rural electrification has created an overwhelming demand for workmen trained in "hot line" work. The program of job safety training operated by the Division of Trade and Industrial Education in conjunction with the Rural Electrification Cooperative Corporation and the vocational school serving the area offers planned job training and safety instruction in all phases of line work. This course includes right-of-way clearing, tree trimming, digging holes, setting poles, handling and firing dynamite, techniques of tying knots, splicing ropes, installing and connecting switches, meters, and transformers. Instruction includes both class work and on-the-job direction and observation.

EXTENSION CLASSES

Trade Extension Classes: The Area Vocational-Technical Schools of Kentucky offer a comprehensive program of trade extension courses of a supplementary nature. These courses are offered to those who are employed or temporarily unemployed in industrial and technical occupations and who need to increase the skills and knowledge used in their daily employment.

Such courses may be conducted at any location in the state, and for any amount of time necessary to do the specific type of training needed by a specific group of workers. For example, a trade extension course for carpenters might consist of innumerable short units; such as, blueprint reading, sketching, mathematics, roof framing, use of steel square, or stair building. Each short unit usually consists of three to ten lessons, and classes usually meet twice each week, three hours each session.

Several short units in the same trade may be offered for those desiring to improve themselves in different phases of their work. This allows the worker to enroll for a particular phase of training which will be most valuable to him in his immediate progress in his occupation without being forced to go through a vast amount of material which at the time is not pertinent to his immediate needs. On whatever basis they are offered, they must be supplemental to the daily employment of those in the group.

Part-time Apprentice Classes: Part-time trade extension classes are provided for apprentices at any location where a sufficient number can be enrolled to justify the cost of instruction. These courses are operated for the purpose of providing necessary related technical knowledge to young apprentice workers in any industrial occupation. In addition to working on the job, the apprentice attends evening classes for a minimum of 144 hours per year where he learns mathematics, blueprint reading, science, and theory pertaining to his trade. Apprenticeship training permits one to "earn while he learns" his trade in an organized course designed for his special needs.

TECHNICAL EDUCATION

The program of technical education is designed to prepare individuals for various technical positions in such fields as electronics, metallurgy, chemistry, drafting and design, aeronautics, etc. These workers may support and work under the supervision of a professional engineer. However, the program of training for a technician is much shorter and more specific than that for the engineer.

The need for technicians is increasing at a phenomenal rate and career opportunities in technical work exist in a wide range of occupational fields. This implies challenges and opportunities for those who have the necessary aptitudes, interests, and abilities.

The education required at this level is based upon the principles of science and include sufficient post-high school mathematics to enable the student to accomplish the technical objectives of the courses. Emphasis is placed on the use of rational processes in the fundamental portion of the curriculum.

The training needed for successful employment as a technician in industry is normally about two years of full-time instruction, although some technical jobs require perhaps one year or less. A few highly technical occupations require some additional training beyond the two years.

In addition to the preparatory programs, employed workers in specific technical fields may take extension or supplementary courses to better meet changing occupational demands and for job advancement opportunities.

VT 003 200
Burgener, V.E.
A Rationale for Research in Vocational Education.

Illinois Research and Development Coordinating Unit, Springfield
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Jul65 12p.

*RESEARCH COORDINATING UNITS; *OBJECTIVES; *EDUCATIONAL RESEARCH; *VOCATIONAL EDUCATION; RESEARCH NEEDS; PROGRAM COORDINATION; EDUCATIONAL CHANGE

The State Research and Development Coordinating Unit should concern itself with the total spectrum of research and development: problem identification, priority, theory development, model design, engineering, modification, experimentation, field trials, packaging, demonstrations, diffusion, adaptation, and program implementation. Seldom is the same individual capable of performing more than one of the subfunctions in the research and development spectrum. The Research Coordinating Units may provide their best coordinating service by finding and bringing these separate specialties together. The coordination function must meld the thought of the theoretician to the procedure of the practitioner. As administrative agencies they should not attempt to become research generating stations. V. E. BURGENER
Illinois Research Coordinating Unit

A RATIONALE FOR RESEARCH IN VOCATIONAL EDUCATION

V. E. Burgener, Coordinator of Research,
Illinois Board of Vocational Education & Rehabilitation
and Director of the
Illinois Occupational Research and Development Coordinating Unit

Research is often defined in a very restrictive manner. The scholar is wont to conceive research as a "think tank" activity. Occasionally, it has been considered a "cloud nine," "blue sky," "dreaming," or "conceptualizing"process. If we substitute inquiry for the commonly used basic research, then we can use the term RESEARCH in the broad continuum context of its complete definition. (Figure 1)

Educational inquiry alone is not enough. Inquiry which can not be or is not translated into educational practice is largely useless. For this reason the Occupational Research and Development Coordination Unit for vocational education in Illinois has considered research to be bounded by a macrocosmic parameter. Our spectrum of research and development covers those areas beginning in the deep purple of problem identification and continuing through related processes which eventually result in the bright red glow of program implementation.

Guba[1] proposes a taxonomy of this procedure which he says "is related to and necessary for change in education." (Figure 2)

(1) Guba, Egon G., The Impending Research Explosion and Educational Practice, School of Education, The Ohio State University, Columbus, July 1965

VT003200

His schema is very little different than the research and development sequence outlined by Brickell[2] as I. - INQUIRING INTO THE WAY THINGS ARE; II. - CREATING A PROCEDURE FOR GETTING SOMETHING DONE; III. - DETERMINING WHAT A PROCEDURE WILL DO; IV. - MOVING A PROCEDURE INTO GENERAL USE which is "workable for the effective utilization of research." (Figure 3) Both writers point out that seldom is the same individual capable of performing more than one of the subfunctions in the research and development continuum. In fact, there is probably no better way to stifle the inquirer than to insist that he also become a disseminator. Similarly, an activity design specialist may have no capability to install or achieve adoption of his design. Lee[3] and Brickell both suggest a varying responsibility for research functions between universities, state departments, and local schools. (Figure 4)

The State Research and Development Coordinating Units may provide their best coordinating service by finding and bringing these separate specialties together under one banner. As an administrative agency they should not (and we do not) attempt to become a research generating station. We can find competent inquirers to do empirical studies, to establish and test theories,

(2) Brickell, Henry M., The Role of Research and Development in Vocational Education, Manhasset Public Schools, Manhasset, New York, May 1965

(3) Lee, Allen, A Philosophy of Relationships for State Research and Development, University of California, Berkeley, 1966

to conceptualize, and to propose new truths. As an operating agency we should provide the linkage necessary to bring the results of such inquiry through the development process of innovative design into settings for laboratory and field testing from which the results can then be diffused by demonstrations and adaptations into patterns for general adoption. Regularization of an innovation by general adoption, Guba says, converts it into a noninnovation and releases the researcher to start on a new activity.

A Research Coordination Unit that does not concern itself with this total spectrum can be only partially successful. The coordination function must meld the thought of the theoritician to the procedure of the practitioner. Thus, may the theory-practice gap in education be narrowed. Only when progressive change becomes a continuum process can we make concerted effort to lessen the fifty year educational lag. Realizing that much change is long overdue in education generally and vocational education specifically, we prefer not to wait for the futuristic theoretical possibility of some new absolute truth which could be implemented, but instead attack the problem immediately at any point of the continuum. There is really no best place to start for an experiment may feed back to new and more pertinent basic problems for inquiry or the results of inquiry may feed directly into a diffusion pipeline.

Our Illinois Unit is intermittently accused and complimented for emphasizing action or applied research rather than basic research. Colorwise, we are partial to the red segment of the

spectrum. This is the area of shortest wave lengths, which may be an apt analogy. This could well indicate that results come faster because this is nearer to "where the action is." We readily accept the criticism or the compliment if basic research is defined as "studious inquiry or examination" (Webster) and action research as "investigation or experimentation aimed at the discovery and interpretation of facts, revision of accepted theories in the light of new facts, or practical application of such new or revised theories." (do) We accept the pragmatic approach because of its immediate effect on product output.

Our usable product output seems greater at this end of the spectrum. When we make our commitment to ACTION RESEARCH, we are really cast into the same barnyard with the farmer who must determine a better method to spread accumulated manure before he is inundated with more of a newer and stronger product.

We believe we achieve this emphasis in several ways:

1. The primary responsibility for inquiry (basic research lies with sophisticated researchers largely in institutions of higher education or in private research organizations. We support such research, when applicable to our specific problems of vocational education - sharing the costs of such study equally with the interested institutions. We commend this form of research to the many agencies which prefer to support such proposals.
2. We utilize staff to locate and then assist in the planning of experimental, field test, and demonstration

projects which will test and disseminate new approaches and changing theories.

3. We review and think about basic truths already researched and promulgated. Why should valid basic research collect dust only to have inquirers busily designing more to accompany it on library shelves, in ERIC, or other hallowed respositories? It bothers us to think that we may have done nothing to help implement basic, absolute, educational truths which have already been determined.

4. We realize that communication, dissemination, and demonstration are costly procedures involving many people. Field trial is not often considered a valid use of local tax money while getting an educational change into operation. We pay a higher proportion of the costs of operation of such programs than any other to encourage their establishment. By emphasizing educational research at the level where it has an immediate effect on our end product--the changed attitude and ability of a person, we can expect more visible and rapid evaluation of its results. Research supported by P.L.88-210 must have evaluative visibility by 1968.

The Illinois Research Coordinating Unit perceives the greatest immediate need for vocational education to be the implementation of measured change based on generalizations obtained from basic research already concluded or in process. Our major thrust is, therefore, pointed toward research processes such as curricular design, experimentation, diffusion and demonstration.

Figure 1

PHYLOGENETIC CLASSIFICATION

A TAXONOMY OF ACTIVITIES INVOLVED IN EDUCATIONAL CHANGE
IN PUBLIC SCHOOL PROGRAMS *

1. Problem Definition is an area for which the state department of education should fulfill the major role after thorough communication and consultation with local schools and higher education.

2. The major role for basic Research should continue with higher education; however, it is vital that local schools and the state department of education have minor involvement.

3. The state department of education should have the major leadership role for Program Development; however, it is essential to have significant involvement of colleges and universities and local schools.

4. In Field Testing the three agencies generally should have equal involvement.

5. In Dissemination the major leadership role should be carried by the state department of education; however, local schools and institutions of higher learning should fulfill supporting roles.

6. In Implementation the major roles should be with local schools and the state department of education because the Constitution gives responsibility to the state, which in turn delegates some. Higher education should play a minor role.

A study of the events associated with the layoff and recall of 1,302 workers at Ford Motor Company, arising from the reorganization of the engine and foundry plants in Windsor, Ontario, was made to ascertain the impact of the experience on the employees with respect to who they were, what happened to them, how they lived, and whether they got a job back. The employees involved in the layoff were all permanent employees, classified as unskilled. The first layoff in June 1966 included 493 workers with seniority of 2 years or less, and the second layoff in August 1966 incuded 809 workers, 90 percent of whom had 17 or more years of seniority. The men with 2 years of less seniority were on layoff from 6 to 7 months, while the high seniority men were off for not more than 4 months. Interviews with 641 of the 1,082 reemployed workers indicated that the availability of alternative temporary work was of major importance in accounting for the lack of resort to extreme economic measures during the layoff. Unemployment benefits for the workers in the first layoff were exhausted about halfway through the period while workers in the second layoff found that benefits lasted the entire period. These benefits were not used by 267 workers. There was little evidence of extreme hardship, and the 220 workers who did not return to Ford were employed in other auto plants or related companies. After the rehiring, production schedules had been exceeded and there was evidence that the workers were more content in the new environment. The interview instruments, data, and information concerning unemployment compensation, supplemental unemployment benefits, and transitional assistance benefits are included in the appendixes. (HC)

● A REPORT OF THE ONTARIO ECONOMIC COUNCIL, 1966

ACKNOWLEDGEMENTS

THIS STUDY, made during the period May, 1965 to July, 1966, was initiated and financed by the Ontario Economic Council. We are indebted to the Council for this support and to Mr. H. S. Lee, Senior Economist with the Council, for his constructive suggestions concerning content and format of the work.

The Report could not have been written without the co-operation of Ford management. Mr. Karl E. Scott, President, Ford Motor Company of Canada Limited, authorized this co-operation. Mr. Joseph Paterson, Industrial Relations Manager, Ford-Windsor, and his associates, Mr. Tom Steele, Section Supervisor, Labour Relations and Hourly Personnel, and Mr. Larry Horwood, Supervisor, Hourly Personnel, spent many hours with us, answered an endless number of questions, and provided reams of data.

Mr. Howard Fullard, Manager of the Windsor Office of the National Employment Service, and Mr. Michael Murray, Manager of the Unemployment Insurance Commission Office in Windsor, performed a most important service in facilitating the collection of employment and insurance data. We owe thanks also to the managers at the local National Employment Service and Unemployment Insurance Commission Offices in Leamington and Chatham.

We wish to thank Mr. Henry Renaud, President of Ford Local Number 200, UAW, and Mr. Hugh Peacock, Research Director, Canadian Region, UAW, for their co-operation and support.

Mr. Robert Sperandio, until the June convocation a graduate student in Business Administration at the University of Windsor, spent many hours interviewing employees, and processing data.

The final decision as to the selection of relevant material was ours. We accept this responsibility.

C. M. BIRCH
J. B. GERTZ

FOREWORD

The layoff during 1965-66 of 1300 men at the Ford Motor Company's foundry and engine plant at Windsor, Ontario, was one of the most significant dislocations of labour arising from the Canada-United States Automotive Trade Agreement.

It was significant both in terms of numbers of employees affected and duration. Fortunately, however, as Professors C. M. Birch and J. B. Gertz of the University of Windsor's Faculty of Business Administration demonstrate in this study, the element of hardship was limited.

Only a negligible number of laid-off employees chose to avail themselves of allowances under federal-provincial programs for education or skill upgrading. The booming Windsor economy offered many job opportunities for those who did not choose to "sit out" the layoff with the assistance of Unemployment Insurance compensation and Supplemental Unemployment Benefits.

Of the 1,302 temporarily laid off in the summer of 1965 some 1,082 had returned to their jobs by late February, 1966, and several hundred additional new workers were added in March and April.

The Ontario Economic Council initiated this study in co-operation with the Ford Motor Company; the UAW, Canadian region; and the provincial and federal departments and agencies concerned. To each of them, and to researchers Cecil Birch and Blake Gertz we express our appreciation, and commend the findings to all persons concerned with these aspects of government-labour-management relations.

WILLIAM H. CRANSTON,
Chairman, Ontario Economic Council.

September, 1966.

Introduction

THIS REPORT is a study of events associated with the layoff and recall of 1,302 workers at Ford Motor Company, arising from the reorganization of the engine and foundry plants in Windsor, Ontario. The layoffs, originally scheduled for June, July and August, 1965, occurred at the end of June and in the middle of August. The 1,302 men were all permanent employees, classified as unskilled. There were 493 men in the first layoff,[1] and 809 in the second.[2]

Recalls began in September, and by the end of the month 250 men had gone back to work. These men had vacation time coming to them when laid off in the middle of August. We felt that if these 250 men were included, the value of information gained by interviewing laid-off employees would be reduced appreciably, so we decided to interview only men returning after September 30, 1965.

Of the 1,052 who might have been interviewed (1,302 minus 250) it was not possible to interview 220 because they did not return to Ford. This reduced the potential number of interviews to 832 (1,052 minus 220). We interviewed three-quarters of the 832, that is, 641 men.

The 191 men not interviewed, but re-employed, were divided approximately equally between the first and second layoffs. They were not interviewed for a variety of reasons, mainly because of problems associated with the mechanics of re-employment. For example, 50 men on layoff would be notified to report to Ford at 8:30 Tuesday morning. They might come or they might not; if they did, it might be 8:30 Tuesday evening, or Wednesday, or Thursday, and at any hour of the day or evening.[3]

The mechanics of recall are not as simple as they may appear. Administrative, engineering, and training problems associated with new equipment, make it difficult to set up monthly or even weekly schedules for recalling workers. The company might know on a Friday afternoon, for example, that they could recall another 50 men the following Tuesday, and the men would be so notified. They might show up at some odd hour Tuesday, Wednesday, or Thursday, or not at all. Further, the men themselves might not be in control of the circumstances deciding their appearance at Ford. They might be out of town when the recall came, or they could be working elsewhere, and find it difficult to get time off to come in to see whether or not they were really going to be re-employed. While the whole layoff and recall procedure might appear to be routine, it was, in fact, humanly impossible to make it a neat, tidy operation.

When an individual was recalled, he was processed for re-employment at the Ford personnel office, and then he was interviewed by our representatives in facilities provided by the company. We asked questions nos. 6 through 37, and question no. 46 (Appendix B-1). In some cases answers were refused, but the great majority of men were most co-operative and answered all queries. When the same question was asked twice, we sometimes received two different answers, but this is usual in personal interviewing.[4]

Prior to questioning, we had obtained from Ford the name, address, birth date, marital status and seniority of all 1,302 men. After interviewing, we obtained from the National Employment Service (NES), and the Unemployment Insurance Commission (UIC), information on unemployment compensation and supplemental unemployment benefits for each of the 1,302, and last referral given by NES for 66 of the 220 men who did not return to Ford.[5]

Our assignment from the Ontario Economic Council was to ascertain the impact of the Ford experience on a section of its employees, with respect to who they were, what happened to them, how did they live, and did they get a job back. This Report relates what occurred.

CHAPTER I presents the background to the Ford Motor Company's decision to spend $50 million on machinery and equipment for the engine and foundry plants in Windsor, Ontario. This background is drawn from the Bladen Report (1961), the tax rebate arrangement established in 1962 by the Federal Government and carried on in 1963, and the Canada-United States Automotive Trade Agreement (1965).

Chapter II indicates the importance of the decision to the company in terms of the number of men affected, and in terms of the reorganization of physical facilities.

Chapters III, IV, and V describe the layoff and recall of 1,302 unskilled workers in detail.

---

[1] Several hundred university students were employed in May for about six weeks, and they too were laid off at the end of June, and not recalled. They are not counted in the layoffs.

[2] Actually, 86 men were laid off twice — first in June, then recalled, and laid off again in August. Rather than count them twice, we subtracted them from the second layoff.

[3] See Chapter IV.

[4] For example, the men were asked if they had been gainfully employed while laid off (question No. 7, Appendix B-1), and later in question No. 37, they were asked if they had found temporary work; the number of "yes's" in the two questions do not match. In this Report we have ignored the answers to question No. 37.

[5] The company did not participate in the Transitional Assistance Benefits (TAB) plan of the Federal Government. For a summary of TAB see Appendix E.

Summary and Findings

1. Description of the layoffs

The first layoff of 493 men occurred at the end of June, 1965; the second layoff of 809 men took place in the middle of August. Two-thirds of the personnel involved in the first layoff were re-employed at Ford after being off work five to seven months; 93% of those in the second layoff were re-employed about four months after their layoff.

The layoffs may be described also in terms of those who returned and those who did not return to Ford.

Characteristic	First Layoff (493 men)	Second Layoff (809 men)
1. Living in Windsor	63%	78%
2. Age	88% under 35	93%, 35 and older
3. Marital status	42% single	20% single
4. Seniority	95% two years' or less	92%, 17 years' or more
5. Pay class	79% earning $2.44, $2.49 or $2.54 per hour	87% earning $2.44, $2.49 or $2.54 per hour
6. Length of layoff	5, 6 or 7 months	4 months or less
7. Number returning	326 (i.e. 66%)	786 (i.e. 93%)

2. Experiences of the laid-off men

Of the 1,082 men who returned, 267 did not use unemployment compensation (UC) or supplemental unemployment benefits (SUB) while laid off, either because they were working or because their layoff period was short.

There were 327 men who averaged $68 a week in combined UC and SUB benefits while drawing benefits; 144 had $76 a week in combined UC and SUB benefits. The remainder (about 30%) had various combinations of UC and SUB.

The men in the first layoff drew benefits for seven or eight weeks on the average, and virtually all who used benefits exhausted them half way through the layoff period. Those in the second layoff drew benefits for 11 or 12 weeks, and most of them found their benefits lasting for the full layoff period since they also were entitled to a paid vacation of two or three weeks.

While the layoff period was disruptive and often difficult, there was little evidence of extreme hardship, as measured by children leaving school, families losing homes or selling household furniture, or appeals to the city for assistance. In the second layoff, those affected lived for the most part on UC, SUB, and past savings; the men in the first layoff also relied on these resources, but most importantly they found temporary work. At least 90% of those in the first layoff were gainfully employed while away from Ford. About 15% of those in the second layoff obtained temporary work—probably all who active-

Characteristic	Returned (1,082 men)	Not Returned (220 men)
1. Living in Windsor	72% of 1,082.	75% of 220.
2. Age	30% of the 1,082 men were under 35; (67% of the men under 35 returned).	72% of the 220 men were under 35.
3. Marital status	24% of the 1,082 were single; (70% of single and 88% of married men returned).	50% of the 220 were single.
4. Seniority	29% of the 1,082 had 2 years' or less; 64%, 17 years' or more; (65% of 2 years' or less returned; 94% of 17 years' or more returned).	75% of the 220 had two years' or less; 20% 17 years' or more.
5. Pay class	86% of those earning $2.44 to $2.54 per hr. when laid off returned.	76 men earned $2.39 per hr. or less at layoff, 61 of them did not return.
6. Temporary job	90% of first layoff found a job early in their layoff—half of them had a job for full length of layoff; 15% of second layoff had a temporary job.	
7. Drew both UC and SUB benefits	25% of first layoff returning drew benefits; 72% of second.	10% of first layoff not returning; 30% of second.
8. Drew neither UC nor SUB benefits	45% of first layoff returning did not draw any benefits; 15% of second	70% of first layoff not returning; 40% of second.
9. UC	50% of first layoff returning drew benefits, for an average of 7 or 8 weeks; 75% of second drew benefits for an average of 11 or 12 weeks.	25 to 30% of non-returnees drew benefits; average length of draw was one month.
10. SUB	28% of first layoff returning—for 7 or 8 weeks; 80% of second for 11 or 12 weeks.	13% of first layoff and 60% of second drew SUB; drew for 1 month if first layoff, 3 months if second.

ly sought work. At least half the men who found employment held their jobs for the full layoff period.

Most of the 220 who did not return to Ford went to work right away, without using either UC or SUB. Some of the men left Windsor, a small number retired, but most found jobs in the immediate area. On the basis of last referral by the National Employment Service, they found work as labourers in other auto plants, in feeder or parts plants, or in related companies.

3. Findings

a. It may seem obvious to say that nothing reduces technological unemployment in one occupational or industrial area quite as much as a labour shortage in a competitive occupational or industrial area. Yet, however self-evident it may be, this was an economic fact of life during the layoff period, and it had great relevance to the experiences of the laid-off workers. The availability of alternative temporary work was of major importance in accounting for the lack of resort to extreme economic measures by the laid-off men.

b. Substantial reorganization of production facilities, and the introduction of modern machinery and equipment, challenged the ingenuity of management. Theoretically, it should have been possible to schedule layoffs and recalls in an orderly manner. In practice, it proved impossible. The recall schedules were especially difficult to plan, so much so that they were altered almost daily. As it turned out, the employees were on layoff for a shorter time than had been anticipated. Late April of 1966 was the estimated date of last recall. In fact, all were back by late February, and several hundred new men were hired in March and April. The production schedules tentatively established in September were not only met, but output exceeded expectations substantially for the following seven or eight months.

c. There is some evidence that the men are more content in their new environment. This attitude may change, especially if it is due only to the newness of the surroundings, or to the fact of returning to permanent employment. However, there is more than a possibility that the efficiency of the new operations has given the workers a sense of stability and accomplishment which formerly had been difficult to achieve. When 186 varieties of engines run on an assembly line, bottlenecks are inevitable, and therefore wasted time and slack periods are common. This in turn results in disinterest among the workers; but when the production operation is efficient and well-run, this exerts a positive influence on employees.

d. The experiences of the Ford workers may well be unique, and not duplicated as non-automotive plants modernize, reorganize and automate. The tremendous demand for automobiles, arising out of a prosperous economy, and especially the sizeable growth in demand generated by the Canada-United States Automotive Trade Agreement, made it possible in late 1965 and early 1966 to call back relatively quickly all those laid off at Ford, and to hire several hundred additional workers as well. But what if demand had been stable or declining? The high seniority workers would have been out of work for a longer period, using up more UC and SUB benefits, while the low seniority workers would have faced an indefinite layoff with benefits exhausted long before the termination of their layoff.

As it happened however, there were numerous openings in local industry for unskilled workers. But in less prosperous times their economic experiences might well have been quite different. When temporary jobs are available, laid-off men are not inclined to take training programs. Whether those workers would have participated in such programs under other circumstances is speculation. At least it is reasonable to think that ordinarily a training program would be needed, not so much for the workers who will be recalled—Ford has shown the employer can retrain the workers as they are recalled—but for those who will not be recalled for an indefinite time. The men at Ford did not need to develop job mobility, except to a very limited extent. Ordinarily such development would be of critical importance. One fact which emerged was that the older men (in sharp contrast to the younger men) were not hired into production jobs in other factories.

CHAPTER I

Events Leading to Ford Decision to Reorganize Production Facilities

CANADA'S LONG-STANDING imbalance of motor vehicle trade with the United States and the rest of the world, and the relatively less efficient operation of the Canadian automobile industry represent the major problems which finally led to the Canada-United States Automotive Trade Agreement in 1965.

A number of events preceded this agreement. In August of 1960, a Royal Commission, under the chairmanship of Vincent Bladen, Dean of the College of Arts at the University of Toronto, was established to prepare an economic analysis of the Canadian automobile industry. A decade earlier, under the pressure of strong domestic demand, Canada had become a net importer of motor vehicles for the first time in the history of the Canadian industry. Three years after that, in 1953, Canadian vehicle production was 481,000 units (the high point for the 1950's as it turned out), with exports and imports about balancing each other. By 1960 exports had dropped by two-thirds and imports had tripled,[1] with imports accounting for one-third of all motor vehicles sold in Canada.

Combined with the adverse trade balance, and indeed partly responsible for it (at least as far as trade with the United States was concerned) was the inability of the Canadian industry to produce on a scale large enough to reap the benefits of mass production.

As Dean Bladen stated in the Report: "In processes for which the optimum scale of production is very high, such as large body stampings and automatic transmissions, even total Canadian requirements would not warrant production in Canada."[2] Considerations about optimum scale of operations were and are becoming increasingly important through the 1960's. More and more does the technology of the industry demand expensive and specialized machinery. This, in turn, requires increasing volume before low unit costs can be achieved.

Many proposals have been made about the problem of high unit costs because of low volume. Most of them are patently unworkable. One typical suggestion is to "give" the Canadian market to one producer, or at least to one model of a few makes, such as one model of Ford, one of Chevrolet, and one of Plymouth. Dean Bladen did, in fact, listen to testimony about the advantages of the hypothetical "Canadian car". The concept may be interpreted to imply a "Volkswagen approach" whereby large volume can be produced, because there is only one model, and because the one basic style is unchanged for a number of years. However, the realities of Canadian economic, business and political life are thought to make such a proposal impractical, since people appear to want variety and are willing to pay for it.

But the goal — one plant producing large volume with little variety—certainly has merit from a unit cost point of view. Thus, while it is not practical to establish a monopoly to produce a "people's car", perhaps something can be done to reach the desirable goal of lower unit costs (and hopefully lower selling prices) while maintaining satisfactory profit margins. Obviously, all this can be achieved only in the setting of a larger Canadian market than currently exists or can be expected to exist in the future. A North American market rather than a purely Canadian market, would appear to be a desirable alternative.

On this score Dean Bladen was attracted by the submission of the Ford Motor Company of Canada, recommending exploration of proposals for closer integration of the productive facilities of the Canadian and American manufacturers. Ford said in its submission that such integration "could provide Canadian producers with the full-cost benefits of U.S. mass production which could then be passed on to Canadian consumers. Adequately controlled by intergovernment agreement to insure continued growth of the Canadian industry relative to the Canadian economy, this arrangement could result in important benefits to Canadian consumers through lower prices."[3]

The recommendations of the Report were unilateral rather than bilateral. The recommendation that caught the imagination of the government seemed to stem from separate submissions. One of these proposed that Canadian production should be the same share of North American production as sales in Canada were of North American sales. At the time, Canadian production was about four per cent of North American production, while sales in Canada ran close to eight per cent. These two statistics dramatically suggested a goal — production to match sales. The other submission closely related to it was ". . . to allow credit for Canadian content purposes for parts made in Canada but used in American production. Our . . . industry might well reduce the number of parts they are making but gain greatly increased volume on the remainder . . ."[4]

These two concepts were combined to form the Commission's most striking recommendation, namely that cars and parts be imported duty free provided Canadian content requirements be met, or in effect, that Canadian content be (e.g.) 60%.[5] The conviction was that the Canadian industry would suffer from the disadvantages of low-volume production as long as it was geared only to the Canadian market. But if Canadian manufacturers could produce for a wider market and at the same time had duty-free access to the high volume low-cost producers of the United States, then they might break through the limits imposed by low-volume production.[6]

The next event after the publication of the Royal Commission Report in 1961 was the action taken by the Federal Government to allow rebate of import

4 *Ibid.*, p. 46.

5 *Ibid.*, pp. 58 ff.

6 For a critical evaluation of the Report see H. G. Johnson, "The Bladen Plan for Increased Production of the Canadian Automotive Industry", *The Canadian Journal of Economics and Political Science*, Vol. 29 No. 2 (May 1963) pp. 212-38.

duties on transmissions and engine blocks if exports increased. For every dollar of Canadian content of exports of motor vehicle parts in excess of the Canadian content of exports of parts during the base period from November 1, 1961 to October 31, 1962, duties were to be remitted on a dollar of transmission or engine imports. The plan was so effective that it was extended in October 1963 by a new federal administration. Tariffs on all imports of motor vehicles and original equipment parts were to be remitted to the extent that the Canadian content of exports of motor vehicles and parts of the company in question exceeded that of the base period, November 1, 1961 to October 31, 1962.

The tax rebate plan was the forerunner of the Canada-United States Automotive Trade Agreement of 1965. This 1965 Agreement came as a surprise to many people who had forecast that the tax rebate would result in the imposition of countervailing duties by the United States government.[7]

A proposal like the tax rebate arrangement may be regarded as an export subsidy. It was condemned by many in the United States on political grounds as a violation of the General Agreement on Tariffs and Trade (GATT). It was condemned also by some people in both the United States and Canada as thinly-disguised (and probably unrecognized) protectionism.[8] The alleged violation was never tested in American courts but there is fairly widespread conviction that American parts manufacturers would have been successful in persuading the American government to retaliate, for example, by higher tariffs, if the tax rebate had continued in operation. But in 1965, it was replaced by the Canada-United States Automotive Trade Agreement.

The Agreement was signed in January, 1965 by the Prime Minister of Canada and the President of the United States. It went into effect at once in Canada, but it was not until the following October that the Agreement was approved by the Congress of the United States and made retroactive to January 19, 1965. Under the pact, Canadian produced vehicles and parts are allowed into the United States duty free, while Canada permits "qualified" Canadian automotive manufacturers to import vehicles and parts without duty if certain conditions are met.

In this Report we are interested in one consequence of the Automotive Trade Agreement — the decision of the Ford Motor Company of Canada to spend $50 million reorganizing its engine and foundry operations at Windsor, Ontario, with a view to producing a greater volume of a more limited line of automobile engines.

Specifically, Canadian manufacturers must (1) continue to spend as much in Canada on auto production as in the base year (the 1964 model; August 1, 1963 to July 31, 1964), (2) maintain a ratio of the value of production of vehicles and parts in Canada to sales equal to that of the base year, (3) increase spending on Canadian vehicles and parts production.

The goal, from Canada's view, is to raise Canada's share of North American automotive production from four per cent prevailing prior to the Agreement, to eight per cent, i.e. the same as Canada's share of sales. This goal is to be reached through rationalization, more specialization, greater efficiency, and leading, in some views, to Canadian car prices more nearly in line with U.S. prices. Approximately $250 million of trade deficit will be wiped out by the end of 1967 if the Canadian producers expand according to their agreements with the Canadian government.

Opinions regarding the Agreement have been many and varied, ranging from "a $50 million a year give-away to foreign-owned manufacturers" to "the most important piece of Canadian legislation in this century", with plenty of comments in between, many of them attacking the secrecy surrounding the government-company arrangements as to how much sales and production are to increase.[9] For the most part, the criticisms have been directed to methods rather than purpose, for the incontrovertible fact is that great variety with small scale is not economical. For example, when Ford makes sixty models of six different cars at its Oakville plant, but only two or three models are assembled at any one plant in the U.S., or when 186 models of engines are produced instead of eight, then the savings potential through rationalization is great.

CHAPTER II

Reorganization of Plant Equipment and Personnel

FORD MOTOR COMPANY (U.S.) was launched at Detroit, Michigan, on June 16, 1903, and on August 17 of the following year, Ford Motor Company of Canada was established at Windsor, with initially subscribed shareholder capital of $125,000. In that first year the Canadian company produced 117 automobiles, 107 of which were two cylinder Model C's; ten were four cylinder Model B's which developed twenty horsepower. In 1907, production totaled 327 cars; 486 in 1909. By 1917, output exceeded 57,000 units annually. The company reached a production level of 100,000 for the first time in 1926. In March of 1931, the one-millionth Canadian Ford came off the assembly line. By 1959, 3.5 million cars and trucks had been produced; by the end of 1965, a total of 4.6 million vehicles.

Ford of Canada began operations in 1904 with seventeen employees; by 1911 over 1,000 were on the payroll; the total for 1959 was 19,336. Current employment (May 1966) is approximately 11,000 hourly and 4,000 salaried employees. With the completion of the new assembly plant in St. Thomas, Ontario, programmed for next year, the total work force is expected to increase by not less than 2,500.

By 1917, the Windsor plant contained over 300,000 square feet of manufacturing area, and cars were also being assembled at London, Toronto, Montreal, Winnipeg, and Saint John. In 1935, an assembly plant was opened in Vancouver. In the early days of the company, when so many parts of the car were imported, small assembly plants were, perhaps, economically feasible, but with the development of mass production, assembly-line-type of output, it became necessary to consolidate facilities. Outside Windsor the only assembly plant to operate after World War II was located in Vancouver, and it too was shut down by 1948, leaving Windsor as the sole source of Canadian production.

But the demand for cars was rising, reflecting the rising standard of living of the Canadian people: in 1946, the industry —resuming civilian production, which had been suspended in 1942—produced 92,000 cars (plus 80,000 trucks); in 1948, Ford production alone exceeded 100,000 units. To meet the increasing demand, Ford began a vigorous modernization program after World War II. In 1950, the Windsor powerhouse was expanded at a cost of $7 million. In May 1953, a new final assembly plant was opened at Oakville, Ontario, and assembly ceased at Windsor. The latter plant was converted to the manufacture of automobile engines, while other Windsor production facilities remained basically unchanged. Approximately 4,438 hourly-rated people are currently employed in Ford-Windsor.

To satisfy a diversified, though limited market, the Windsor plant turned out seven different engine blocks which, with numerous variations in block bore, axle ratio, carburetion, etc., could be made up into 186 varieties of engines. Obviously, long production runs were out of the question under these conditions and, as might be expected, the plant was filled with over 2,000 multi-purpose metal-working machines: grinders, drills, broaches, boring machines and the like which, collectively, were rather low in productivity compared to the automated, integrated production line of, say, the Ford engine plant at Cleveland, Ohio. Under these conditions, the Windsor engine plant operating at capacity, turned out about 900 engines per day. Before the changeover to automated production, average hourly-rated employment in the foundry was 925; in the engine plant about 1,100.

As a result of the Canada-United States Automotive Trade Agreement, the entire North American market for cars and original equipment opened up to Canadian producers, and Ford decided to make Windsor a major engine plant, embodying the latest in high-speed automated (continuous, integrated and electronically controlled) metal-working machinery.

In June of 1965, the plant produced its last engine with the old equipment, and the reorganization of the facility began. During the shutdown (throughout this period Canadian Fords were built with U.S.-supplied engines) 900 of 2,008 pieces of equipment were removed from the plant and disposed of, while 225 new pieces were brought in. It should be noted that there is limited significance in any comparison of numbers here; ten drill presses boring a total of ten holes might be replaced with one new unit boring, say, fifteen holes.

After the changeover, employment in the foundry, where the blocks (and certain other components) are cast, rose to 1,079 hourly-rated personnel, an increase of 154. By June of 1966, employment in the engine plant totaled 1,600, up 500 over the pre-reorganizational figure of 1,100. Since there were organizational changes in the latter facility, exact comparison on a before-and-after basis is difficult, and it should be understood that the figures are subject to some modification.

Revamping production methods brought changes in the nature of the work performed by many of the hourly-rated personnel. Less physical effort is needed, but in many instances more responsibility is involved, or a greater degree of alertness is required. Many of the workers had to be retrained; operative employees were retrained on the job; 100 maintenance people went through a formal training program lasting, in some cases, several months. Management reports that more workers see themselves as technicians rather than machine operators; foremen report fewer grievances and state that their job has become less difficult as machines take over more and more of the work and increasingly control the work pace. Automation has given a new status to the hourly-rated employees, with a potentially great effect on worker morale.

The product has changed significantly. Instead of seven engine blocks, the plant now produces one (the #289 CID, a V-8 type). Instead of 186 varieties (built out of the seven blocks), there are now assembled only eight, and output has doubled to 1,800 engines per day.[1] More than 50% of all production is for export. Engines produced in Windsor are used in many of the Ford cars assembled in the United States. With this new engine plant Canada has acquired one of the most modern facilities of its kind in North America.

---

[1] Ford officials preferred not to release production figures; the above estimates of production were supplied by Mr. Hugh Peacock, Research Director, Canadian Region, UAW.

CHAPTER III

The Total Layoff — 1,302 Men

Total interviewed (laid off, returned)	
First layoff	234
Second layoff	407
	641
Total laid off and returned	
First layoff	326
Second layoff	756
	1,082
Total laid off and not returned	
First layoff	167
Second layoff	53
	220
Total layoff	1,302

In June and August of 1965, the Ford Motor Company of Canada laid off 1,391 of its employees in Windsor, Ontario, while new equipment was being installed and production facilities reorganized in the foundry and engine plants.[1] This Report is concerned with 1,302 of the 1,391 employees—the difference of 89 is accounted for by 86 men laid off twice, and three men for whom the information we had was invalid and could not be used. The men laid off twice are included in the first layoff, and not the second, because they were low seniority employees.

The number 1,302 divides into 493 on the first layoff, and 809 on the second layoff. For the June layoff of 493, a total of 167 never returned to Ford while 326 did return. Of the 326, two hundred and thirty-four were interviewed at recall time and were asked the questions indicated in the questionnaire (Appendix B-1). For the August layoff of 809, all but 53 returned to Ford. Of the 756 who returned, 407 were interviewed. Most (i.e. 250) of those not interviewed could scarcely be called "laid off" since they had vacation time coming to them and were re-employed during September. We felt that these 250 would unduly influence the relative importance of answers given, so we concentrated on returning employees after the end of September. This means we interviewed 407 of a possible 506. (See Appendix A).

[1] While only the engine and foundry operations were involved directly in modernization, employees in other plants were affected because of seniority provisions of the Labour-Management agreement. Thus, only about half of the laid-off employees were engine and foundry workers — the rest were "bumped" off their jobs by higher seniority engine and foundry employees. Altogether about 700 unskilled men bumped lower seniority people in other departments and plants. Employment of unskilled workers in the engine plant went to zero, but foundry employment declined to about 200 since many operations continued during the changeover. In addition, more than 300 skilled men in the engine plant kept their jobs (or had alternative jobs) during the changeover (e.g. worked in maintenance, or assisted in the changeover itself).

Tables 1 through 20 which follow, examine the total layoff from four points of view:

1. The number of men involved in the first layoff, in the second layoff, and the total of the two layoffs.
2. The number of employees who returned, and who did not return (the total of both layoffs).
3. Those who returned and those who did not return from the first layoff.
4. Those who returned and those who did not return from the second layoff.

Table 1. Residence of All Laid-Off Employees

Place of Residence	First Layoff		Second Layoff		Total Layoff	
	Number	Per cent	Number	Per cent	Number	Per cent
Windsor	311	63.1	631	78.0	942	72.4
Outside Windsor	182	36.9	178	22.0	360	27.6
Total	493	100.0	809	100.0	1,302	100.0

About 72% of the 1,302 laid-off employees lived in Windsor, with a lower proportion for the first layoff than for the second—63% of the first layoff and 78% of the second. The difference is accounted for largely by the tendency of older people to live close to their work because of their high seniority, and since the second layoff was made up mainly of older workers there is a higher proportion of Windsor residents in the second layoff than in the first.

Table 2. Age of All Laid-Off Employees

Age Group	First Layoff		Second Layoff		Total Layoff	
	Number	Per cent	Number	Per cent	Number	Per cent
15 – 19	10	2.0	1	0.1	11	0.8
20 – 24	179	36.3	8	1.0	187	14.4
25 – 34	243	49.3	47	5.8	290	22.3
35 – 44	59	12.0	180	22.2	239	18.4
45 – 54	2	0.4	243	30.0	245	18.8
55 – 64	0	0.0	261	32.3	261	20.0
65 – 69	0	0.0	69	8.6	69	5.3
Total	493	100.0	809	100.0	1,302	100.0

About 55% were under 45 years of age. However, on the first layoff virtually everyone was under 45, while on the second layoff more than 70% were 45 or over. We can anticipate that, since layoff was primarily by seniority, the first layoff was low seniority people (and therefore young workers), and the second was higher seniority (and older) employees.

Thirty per cent of the employees laid off were unmarried. Single men constituted 42% of the first layoff, and 20% of the second layoff. However, these differences are a matter of age, rather than first or second layoff, and marital status proved not to be an important variable for this study.

Table 3. Marital Status of All Laid-Off Employees

Marital Status	First Layoff		Second Layoff		Total Layoff	
	Number	Per cent	Number	Per cent	Number	Per cent
Single	210	42.6	162	20.0	372	28.6
Married	277	56.2	619	76.5	896	68.8
W, D, S*	6	1.2	28	3.5	34	2.6
Total	493	100.0	809	100.0	1,302	100.0

*Widowed, Divorced, Separated.

As expected, there is a significant contrast in the two layoffs with respect to seniority. For the first layoff of 493 men, 469 of them (or over 95%) had two years' seniority or less; for the second layoff of 809 men more than 90% had 17 years' or more seniority; in the total of 1,302 over 55% were very high seniority employees.

Table 4. Seniority of All Laid-Off Employees

Number of Years	First Layoff		Second Layoff		Total Layoff	
	Number	Per cent	Number	Per cent	Number	Per cent
Less than one	221	44.8	0	0.0	221	17.0
1 to 2	248	50.3	6	0.7	254	19.5
More than 2, less than 17	23	4.7	65	8.0	88	6.8
17 or more	1	0.2	738	91.3	739	56.7
Total	493	100.0	809	100.0	1,302	100.0

All the laid-off employees were unskilled and in the pay range of $2.50 per hour plus or minus 20c. Actually, on both layoffs most of the employees were earning either $2.44, $2.49, or $2.54 per hour. Eighty per cent of the first layoff, and 90% of the second were in one of these three pay categories. Fourteen per cent of the laid-off employees in the first layoff earned $2.39 or less while among laid-off employees in the second layoff the corresponding percentage was only 0.8.

Table 5. Pay Classification of All Laid-Off Employees—1,302 Men (As of Date of Layoff)

$ per Hour	First Layoff		Second Layoff		Total Layoff	
	Number	Per cent	Number	Per cent	Number	Per cent
Less than 2.34	1	0.2	6	0.7	7	0.5
2.34	51	10.3	0	0.0	51	3.9
2.39	17	3.5	1	0.1	18	1.4
2.44	157	31.8	228	28.2	385	29.6
2.49	84	17.0	169	20.9	253	19.4
2.54	148	30.0	310	38.3	458	35.2
2.59	19	3.9	59	7.3	78	6.0
2.64	15	3.1	33	4.1	48	3.7
More than 2.64.	1	0.2	3	0.4	4	0.3
Total	493	100.0	809	100.0	1,302	100.0

There is no correlation between living in Windsor or outside Windsor on the one hand, and returning and not returning to work at Ford, on the other hand. For example, 72% of 1,302 lived in metropolitan Windsor, and 72% of those who returned also lived in Windsor, while just over 74% of those who did not return lived in Windsor.

Table 6. Residence of All Laid-Off Employees

Place of Residence	Total Laid Off		Total Returned		Total Not Returned	
	Number	Per cent	Number	Per cent	Number	Per cent
Windsor	942	72.4	778	71.9	164	74.5
Outside Windsor	360	27.6	304	28.1	56	25.5
Total	1,302	100.0	1,082	100.0	220	100.0

The age distribution of employees who returned is quite close to the age distribution of all laid-off employees, but insofar as there are differences they show up in the group who did not return. Over 70% of all 220 who did not return range in age from 20 to 34, reflecting job opportunities for younger men, and especially a lack of seniority investment at Ford. On the other hand, while 159 men under 35 did not return, there were 329 men under 35 who did return.

Table 7. Age of All Laid-Off Employees

Age Group	Total Laid Off		Total Returned		Total Not Returned	
	Number	Per cent	Number	Per cent	Number	Per cent
15 – 19	11	0.8	9	0.8	2	0.9
20 – 24	187	14.4	113	10.4	74	33.7
25 – 34	290	22.3	207	19.1	83	37.8
35 – 44	239	18.4	221	20.4	18	8.2
45 – 54	245	18.8	235	21.8	10	4.5
55 – 64	261	20.0	249	23.1	12	5.4
65 – 69	69	5.3	48	4.4	21	9.5
Total	1,302	100.0	1,082	100.0	220	100.0

The attrition among laid-off employees was highest among the young, e.g., 40% of all employees in the age bracket 20-24 did not return, and nearly 30% aged 25-34 did not return. Combining this information with the previous Table we see that 70% of those who did not return were in the age range 20-34, but of all those laid off who were 20-34 years old, only one-third of them did not return (i.e., 477 laid-off workers were in the age group 20-34 and 33% of them did not return).

Table 8. Percentage of Age Groups

Age Group	Number Laid Off	Per cent Who Returned	Per cent Who Did Not Return
15 – 19	11	81.8	18.2
20 – 24	187	60.4	39.6
25 – 34	290	71.4	28.6
35 – 44	239	92.4	7.6
45 – 54	245	95.9	4.1
55 – 64	261	95.4	4.6
65 – 69	69	69.6	30.4
Total	1,302	83.1	16.9

More than 28% of those laid off were single, but 50% of those who did not return were single. From another point of view, 372 single men were laid off, and 110 did not return; while of 896 married men laid off, 110 did not return. However, conditions favouring marriage (such as age), in turn raising other important considerations (such as seniority), are the basic factors relating to returning or not returning, and marital status is only indirectly important.

Table 9. Marital Status of All Laid-Off Employees

Marital Status	Total Laid Off		Total Returned		Total Not Returned	
	Number	Per cent	Number	Per cent	Number	Per cent
Single	372	28.6	262	24.3	110	50.0
Married	896	68.8	786	72.7	110	50.0
W, D, S*	34	2.6	34	3.0	0	0.0
Total	1,302	100.0	1,082	100.0	220	100.0

*Widowed, Divorced, Separated

About 57% of those laid off had 17 or more years' seniority, while 64% of those who returned had this much seniority. The implication is that a disproportionate number of low seniority people did not return. In fact, the last column of the Table shows that 75% of those who did not return had two years' seniority or less. On the other hand, about two-thirds (311 out of 475) of those with two years' seniority or less did return.

Table 10. Seniority of All Laid-Off Employees

Number of Years	Total Laid Off		Total Returned		Total Not Returned	
	Number	Per cent	Number	Per cent	Number	Per cent
Less than one	221	17.0	120	11.0	101	46.0
1 to 2	254	19.5	191	17.7	63	28.6
More than 2, less than 17	88	6.8	77	7.1	11	5.0
17 or more	739	56.7	694	64.2	45	20.4
Total	1,302	100.0	1,082	100.0	220	100.0

A little over half of the laid-off employees with less than one year's seniority, and three-quarters of those with one to two years' seniority, returned. Roughly 90% of the remainder returned to Ford. Overall, 1,082 of 1,302 returned, or 83%.

Table 11. Percentage of Seniority Groups

Number of Years' Seniority	Number Laid Off	Per cent Who Returned	Per cent Who Did Not Return
Less than one	221	54.3	45.7
1 to 2	254	75.2	24.8
More than 2, less than 17	88	87.5	12.5
17 or more	739	93.9	6.1
Total	1,302	83.1	16.9

Table 5 showed that 84% of all laid-off employees were earning $2.49 per hour plus or minus 5c. Table 12 indicates that about 87% of those who returned were in that pay range and 70% of those who did not return were in the same range. This implies some tendency for the employees in the lower pay brackets not to return. For example, only 4% of those laid off were earning $2.34 an hour, but 20% of those who did not return were earning $2.34. Of the 51 who were getting $2.34 an hour at layoff time, 43 of them (over 80%) did not return.

Table 12. Pay Classification of All Laid-Off Employees (As of Date of Layoff)

$ per Hour	Total Laid Off		Total Returned		Total Not Returned	
	Number	Per cent	Number	Per cent	Number	Per cent
Less than 2.34	7	0.5	3	0.2	4	1.8
2.34	51	3.9	8	0.7	43	19.6
2.39	18	1.4	4	0.3	14	6.3
2.44	385	29.6	313	29.0	72	32.8
2.49	253	19.4	225	20.8	28	12.7
2.54	458	35.2	405	37.5	53	24.1
2.59	78	6.0	76	7.1	2	0.9
2.64	48	3.7	44	4.1	4	1.8
More than 2.64	4	0.3	4	0.3	0	0.0
Total	1,302	100.0	1,082	100.0	220	100.0

There were 493 men laid off at the end of June, 1965 and of these 326 returned to Ford while 167 were recalled but did not return, i.e., for the first layoff two-thirds of the men returned.

There was some tendency in the first layoff for the youngest workers not to return. Thirty-six per cent of those laid off were 20-24 years old, but 44% of those who did not return were 20-24. However, 60% of this age group (105 of 179) in the first layoff did return. Similarly, the majority of every age group did return.

Table 13. Age Distribution of Laid-Off Employees, First Layoff — 493 Men

Age Group	Laid Off		Returned		Not Returned	
	Number	Per cent	Number	Per cent	Number	Per cent
15 - 19	10	2.0	8	2.4	2	1.2
20 - 24	179	36.3	105	32.2	74	44.4
25 - 34	243	49.3	165	50.7	78	46.8
35 - 44	59	12.0	47	14.4	12	7.1
45 - 54	2	0.4	1	0.3	1	0.5
55 and over	0	0.0	0	0.0	0	0.0
Total	493	100.0	326	100.0	167	100.0

A disproportionate number of single men in the first layoff did not return. Approximately 43% of the first layoff were single men, but of the 326 who returned 34% were single. Of the 137 who did not return almost 60% were single. Even so, just over 50% of the single men in the first layoff did return, and 75% of the married men returned.

Table 14. Marital Status of Employees, First Layoff — 493 Men

Marital Status	Laid Off		Returned		Not Returned	
	Number	Per cent	Number	Per cent	Number	Per cent

Total	493	100.0	326	100.0	167	100.0

*Widowed, Divorced, Separated.

Of 493 men laid off in June, 1965, almost 45% had less than one year of seniority and 95% had two years' or less. The largest proportion who did not return comprised those who had less than one year (101 men of 167 not returned), but more than one-half of the people with less than one year's seniority returned, as did three-quarters of those with one to two years' seniority.

Table 15. Seniority of Employees, First Layoff — 493 Men

Total	493	100.0	326	100.0	167	100.0

There was a marked tendency for those in the lower pay classes of $2.34 and $2.39 an hour not to return, but other than that there was not a great deal of difference between the distribution of employees among pay classes for those who returned and those who did not. However, it should be noted that 56 employees of the lowest paid 69 did not return.

Table 16. Pay Classification of Employees, First Layoff — 493 Men (As of Date of Layoff)

$ per Hour	Laid Off		Returned		Not Returned	
	Number	Per cent	Number	Per cent	Number	Per cent

2.64	15	3.1	13	3.9	2	1.1
More than 2.64	1	0.2	1	0.3	0	0.0
Total	493	100.0	326	100.0	167	100.0

There were 809 men laid off in the middle of August, 1965, and of these, 756 returned to Ford, while 53 were recalled but not re-employed at Ford. Thus, for the second layoff almost 95% returned, compared to 66% for the first layoff.

While in the first layoff it was the younger workers who tended not to return, in the second layoff it was the older workers, presumably because of retirement or physical disability. For example, 40% of the 53 who did not return were 65 years of age or older; it should be noted though, that 48 of the 69 in the oldest age group did resume employment.

Table 17. Age Distribution of Employees, Second Layoff — 809 Men

Age Group	Laid Off		Returned		Not Returned	
	Number	Per cent	Number	Per cent	Number	Per cent
15 - 19	1	0.1	1	0.1	0	0.0
20 - 24	8	1.0	8	1.0	0	0.0
25 - 34	47	5.8	42	5.5	5	9.4
35 - 44	180	22.2	174	23.1	6	11.3
45 - 54	243	30.0	234	31.0	9	17.0
55 - 64	261	32.3	249	33.0	12	22.7
65 - 69	69	8.6	48	6.3	21	39.6
Total	809	100.0	756	100.0	53	100.0

In contrast to the first layoff, there was no tendency for married men to return and single men not to return. In fact, for the second layoff there is no difference at all between the proportion of single men in the total layoff and the proportion of single men among those who returned, or the proportion of single men among those who did not return. We can judge that age, seniority and pay classification are relevant to the decision to return, but not marital status, because 92% (150 out of 162) of the single men and 93% (578 out of 619) of the married men returned.

Table 18. Marital Status of Employees, Second Layoff — 809 Men

Marital Status	Laid Off		Returned		Not Returned	
	Number	Per cent	Number	Per cent	Number	Per cent
Single	162	20.0	150	19.8	12	22.6

W, D, S*	28	3.5	28	3.7	0	0.0
Total	809	100.0	756	100.0	53	100.0

*Widowed, Divorced, Separated.

Of the 809 men laid off in August, over 90% had 17 or more years' seniority and 45 of the 53 who did not return had this much seniority; the 45, however, constituted only 6% of the highest seniority workers laid off in August. High seniority employees not returning suggests that many may have retired.

Table 19. Seniority of Employees, Second Layoff — 809 Men

Total	809	100.0	756	100.0	53	100.0

As with the first layoff there is an indication that the lowest paid employees did not return, but there is virtually no difference between the distribution of employees among pay classes for those who returned and those who were laid off. The small numbers involved in "not returned" practically take the meaning out of the percentages of the last column. This suggests looking for correlations with other variables or supplementing this Table with other information. This is done in Chapters IV and V.

Summary

All Employees Laid Off

(1) Place of residence:

About 72% of the 1,302 men laid off lived in Windsor — the proportion was somewhat greater in the second layoff than the first, because older men were involved in the second layoff; but place of residence apparently had no effect on the decision to return or not to return.

(2) Age:

Virtually everyone on the first layoff was under 45, while 70% of the men involved in the second layoff were 45 or older. Those who did not return were mostly young men (over 70% of those not returning were 25-34 years old), but on the other hand most people in every age group did return, for even in the 25-34 age group two-thirds of those laid off did return.

(3) Marital status:

Half the men who did not return were single, but 70% of the single men did return.

(4) Seniority:

Ninety-five per cent of the men in the first layoff had two years' seniority or less, and over 90% of the men in the second layoff had 17 or more years' seniority. Most of the men (75%) who did not return were low seniority, but two-thirds of the low seniority employees did return. Overall, 83% of the laid-off men came back.

(5) Pay classification:

Most of the men laid off were earning $2.44, $2.49, or $2.54 per hour. This is true of both layoffs. The lowest paid men were least likely to return: for example, of the 51 men who were earning $2.34 an hour at the time of layoff 43 did not return.

(6) First and Second Layoffs

To summarize for the first and second layoff:

(a) First layoff — 493 men

Two-thirds of the first layoff returned to Ford. Those who did not were young, single, low in seniority and low in pay.

(b) Second layoff — 809 men

Ninety-three per cent of the second layoff returned to Ford; most of those who did not were near retirement age.

CHAPTER IV

Experiences of the 1,082 Men Who Were Laid Off and Re-employed

ALL OF THE 1,302 men laid off in June and August, 1965, were recalled to Ford by late February, 1966. Approximately 83% of the recalled workers were re-employed —1,082 men — most of the rest had a job elsewhere and preferred not to return; a few had retired.

General Comments: Age and Seniority

There was a somewhat higher average age of the work force after recall than before the layoffs. This average was reduced when several hundred new workers were added in March and April after all laid-off employees had been recalled.

It is no surprise that high seniority people returned, or that some low seniority workers did not return. It is interesting to note, however, that so many low seniority men returned. For example, 120 men with less than one year's seniority returned (out of 221 laid off), and 191 men with one to two years' seniority returned (out of 254 laid off). With higher seniority, virtually everyone returned.

Over 45% of the men on the first layoff who returned drew neither UC nor SUB benefits, approximately one-quarter used both UC and SUB, and one-quarter used UC only. In the second layoff 15% used neither UC nor SUB, while over 70% drew both.

Table 21. Returning Employees Who Drew Unemployment Compensation And Supplemental Unemployment Benefits

Combination of UC and SUB	Number of Employees		
	First Layoff	Second Layoff	Total
Drew both UC and SUB	80	537	617
Drew UC only	85	31	116
Drew SUB only	12	70	82
Drew neither UC nor SUB	149	118	267
Total	326	756	1,082

In the first layoff about half of each age group drew UC; in the second layoff those using UC outnumbered those not using UC three or four to one. During the first layoff workers who did not draw UC had for the most part found temporary work. In the second layoff failure to use UC reflected either possession of a temporary job, exhausted benefits, or too short a layoff to take advantage of UC.

Table 22. Age Distribution of Returning Workers Who Drew Unemployment Compensation

Age Group	First Layoff		Second Layoff		Total	
	Drew UC	Did Not Draw UC	Drew UC	Did Not Draw UC	Drew UC	Did Not Draw UC
15 - 19	3	5	0	1	3	6
20 - 24	52	53	7	1	59	54
25 - 34	89	76	30	12	119	88
35 - 44	21	26	133	41	154	67
45 - 54	0	1	167	67	167	68
55 - 64	0	0	194	55	194	55
65 - 69	0	0	37	11	37	11
Total	165	161	568	188	733	349

In the first layoff half of those who eventually returned did not use UC while laid off, 35% used UC for up to ten weeks, and the remainder (15%) for more than ten weeks. During the second layoff, 25% did not use UC, 35% used UC up to 10 weeks, and 40% for more than 10 weeks.

Most of the 50% in the first layoff who did not use UC at all went to work in anticipation of a long layoff. Most or all of the 25% in the second layoff who did not use UC had too short a layoff (combined with their vacation pay) to be eligible for benefits.

Table 23. Number of Weeks of Unemployment Compensation For Employees Who Returned

Number of Weeks Drawn	Frst Layoff		Second Layoff		Total	
	Number	Per cent	Number	Per cent	Number	Per cent
0	161	49.4	188	24.9	349	32.2
1 - 5	73	22.4	152	20.1	225	20.8
6 - 10	44	13.5	112	14.8	156	14.4
11 - 15	16	4.9	223	29.4	239	22.1
16 - 20	20	6.1	76	10.1	96	8.9
More than 20	12	3.7	5	0.7	17	1.6
Total	326	100.0	756	100.0	1,082	100.0

Table 24 shows the amount of UC and number of weeks drawn for all 733 men who were laid off and returned to Ford and at the same time, used UC while laid off. About 40% of these men in the first layoff received less than $30 a week, while only 20% of the men in the second layoff got less than $30 a week. So in the first layoff half the men got UC and half did not; those who used it averaged about $27 for seven or eight weeks. In the second layoff 75% of the men used UC and averaged close to $36 for 11 or 12 weeks.

Table 24. Weekly Amount of Unemployment Compensation And Number of Weeks Drawn For All Employees Who Returned And Who Drew Unemployment Compensation—First and Second Layoff

Number of Weeks	Weekly Amount of UC				Total Number of Men	
	Less Than $30		$30 or More			
	First	Second	First	Second	First	Second
1 - 5	34	46	39	106	73	152
6 - 10	21	32	23	80	44	112
11 - 15	3	17	13	206	16	223
16 - 20	4	3	16	73	20	76
More than 20	5	4	7	1	12	5
Total	67	102	98	466	165	568

In the first layoff 92 men drew SUB benefits, compared to 165 drawing UC; in the second layoff 607 used SUB and 149 did not (compared to 568 using UC and 118 not using UC). In other words, in the first layoff almost 30% used SUB while in the second layoff 80% used SUB. The reasons for not using SUB in the first layoff were principally lack of eligibility and temporary jobs, — in the second layoff either layoffs were too short or temporary jobs were found. In the first layoff approximately 25% to 35% of each age group drew SUB; in the second layoff 75% to 90% of each age group drew SUB.

Table 25. Age Distribution of Returning Workers Who Drew Supplemental Unemployment Benefits

Age Group	First Layoff		Second Layoff		Total	
	Drew SUB	Did Not Draw SUB	Drew SUB	Did Not Draw SUB	Drew SUB	Did Not Draw SUB
15 - 19	1	7	0	1	1	8
20 - 24	26	79	5	3	31	82
25 - 34	52	113	33	9	85	122
35 - 44	13	34	140	34	153	68
45 - 54	0	1	177	57	177	58
55 - 64	0	0	208	41	208	41
65 - 69	0	0	44	4	44	4
Total	92	234	607	149	699	383

In the first layoff 72% of those who eventually returned to Ford did not use SUB while laid off, 17% used SUB for up to 10 weeks and 11% used SUB for more than 10 weeks. For the second layoff 20% did not draw SUB, 36% used SUB for up to 10 weeks, and 44% for more than 10 weeks.

Most of the 72% in the first layoff went to work early in their layoff period, while most of the 20% of the second layoff who did not draw SUB were laid off for too short a time to take advantage of the plan.

Table 26. Number of Weeks of Supplemental Unemployment Benefits For Employees Who Returned

Number of Weeks Drawn	First Layoff		Second Layoff		Total	
	Number	Per cent	Number	Per cent	Number	Per cent
0	234	71.8	149	19.7	383	35.4

6 - 10	15	4.6	133	17.6	148	13.7
11 - 15	11	3.4	257	34.0	268	24.8
16 - 20	18	5.5	72	9.5	90	8.3
More than 20	8	2.4	5	0.7	13	1.2
Total	326	100.0	756	100.0	1,082	100.0

Table 27 shows the amount of SUB and the number of weeks drawn for all 699 men who were laid off, returned to Ford, and used SUB while laid off. More than half the men (51 out of 92) in the first layoff received $28 to $35 per week in benefits, or approximately $32 per week. Almost 60% of the men in the second layoff drew benefits in the same range. Therefore, in the first layoff 28% of the men who returned to Ford used SUB while laid off, receiving about $32 for seven or eight weeks; in the second layoff 80% of the men who returned used SUB while laid off, receiving about $32 a week for 11 or 12 weeks.

Table 27. Weekly Amount of Supplemental Unemployment Benefits And Number of Weeks Drawn For All Employees Who Returned — First And Second Layoff

Number of Weeks	Weekly Amount of SUB						Total Number of Men	
	Less Than $28		$28 - $35		$36 or More			
	First	Second	First	Second	First	Second	First	Second
1 - 5	6	18	24	85	10	37	40	140
6 - 10	0	3	10	85	5	45	15	133
11 - 15	1	9	5	145	5	103	11	257

More than 20	1	1	3	3	4	1	8	5
Total	10	33	51	358	31	216	92	607

Of the 1,082 laid off and returned to Ford, 267 used neither UC nor SUB. About 40% of the remainder, namely 327 men, received an average compensation of $68 a week ($36 in UC and $32 in SUB); another 144 had $36 in UC and about $40 in SUB, for $76 a week in total benefits. Altogether this accounts for almost 70% of the 1,082; the remaining 30% were distributed as shown in Table 28.

Table 28. Unemployment Compensation And Supplemental Unemployment Benefits For All Employees Who Returned

Less than $30	54	5	41	69	169
$30 or more	62	31	327	144	564
Total	383	43	409	247	1,082

Table 29 shows that 267 employees of 1,082 drew neither UC nor SUB; 150 men received both benefits for 1 to 5 weeks, 106 men got both for 6 to 10 weeks, 204 men received both for 11 to 15 weeks, 61 men for 16 to 20 weeks, and 7 men for more than 20 weeks. Nearly 75% of the men (795) received both UC and SUB for the same number of weeks.

Table 29. Number of Weeks of Unemployment Compensation And Supplemental Unemployment Benefits For All Employees Who Returned

More than 20	8	0	0	0	2	7	17
Total	383	180	148	268	90	13	1,082

Virtually all the 234 men from the first layoff who were interviewed when re-employed at Ford had been on layoff for 21 to 30 weeks. In other words, they were laid off at the end of June, had some paid vacation coming, and went back between December and February.

For the second layoff in August, 407 men were interviewed. The 250 men who went back in September following a paid vacation were not interviewed because of the brevity of the layoff, so 407 were interviewed out of a possible 506. Two-thirds of the 407 were off for 16 to 20 weeks and the rest were evenly divided between 6 to 10 and 11 to 15 weeks' layoff. Thus, following a paid vacation a large number (250) went back to work in September, and (almost) all were back by late December.

Table 30. Length of Layoff For Employees Who Returned And Were Interviewed

In general, men with two years' or less seniority were on layoff for six or seven months, while the high seniority men were off for four months at the most, a good many going back to work in September through November.

Table 31. Seniority And Length of Layoff
(Laid -off Employees Returning and Interviewed)

[a] Second layoff
[b] Nine of the ten are second layoff

Apparently UC benefits held up very well for anyone laid off four to five months or less, but not so well for those laid off for longer periods, because the young men with long layoffs had not had prior employment for a period of time long enough to build up sufficient benefits for a lengthy layoff.

The experience with SUB is almost identical — most men who received benefits got them for the full layoff period provided that the duration of the layoff did not exceed four months. Relatively few of the young, low seniority, first layoff men received SUB; for the most part those who did exhausted their benefits by the middle of the layoff period.

There are some inconsistencies in this Table; for example, it is not clear how a man who could be laid off less than 11 weeks and draw UC for 16-20 weeks, or SUB for more than 20 weeks. The length of layoff information came from the man himself and in some cases there are communication difficulties due to language barriers. Moreover, we used a different source (the Unemployment Insurance Commission) for information on UC and SUB. We believe that in spite of these obstacles the general trends come through accurately.

Table 32. Number of Weeks of UC And SUB Compared To Length of Layoff

(Laid-off Employees Returning and Interviewed)

Number of Weeks of UC	Number of Weeks Laid Off					Total Number of Men
	Less Than 11	11 - 15	16 - 20	21 - 25	More Than 25	
1 - 5	9	5	20	8	39	81
6 - 10	39	8	20	8	25	100
11 - 15	0	38	128	9	10	185
16 - 20	1	2	61	7	8	79
More than 20	0	0	0	4	4	8
Total	49	53	229	36	86	453
Weeks of SUB						
1 - 5	10	4	20	9	7	50
6 - 10	44	4	32	4	4	88
11 - 15	0	47	139	10	7	203
16 - 20	0	3	57	6	4	70
More than 20	1	0	1	0	3	5
Total	55	58	249	29	25	416
Number of men (Returned and Interviewed)	62	63	272	48	196	641

The interviewed employees were asked the "yes or no" questions listed on the left hand side of Table 33. In this Table the "yes" answers are compared to length of layoff. Apparently most men weathered the layoff by some combination of unemployment compensation, supplemental unemployment benefits and temporary employment. There is very little evidence of children quitting school, the family moving to cheaper quarters, public assistance, selling durable goods, etc. Moreover, there seems to be little evidence that the longer the layoff the more the family had to resort to such measures. (The first three columns of numbers are second layoff men only; the fourth and fifth columns are almost entirely first layoff).

Table 33. Financial Experiences Compared To Length of Layoff

(Laid-off Employees Returning and Interviewed)

Experience	Number of Weeks Laid Off					Total Number of Men
	Less Than 11	11 - 15	16 - 20	21 - 25	More Than 25	
Wife went to work	4	3	25	3	22	57
Children quit school	2	0	2	1	0	5
Education and training acquired during layoff	0	4	7	3	12	26
Decreased savings	25	39	151	26	91	332
Borrowed money	1	8	30	5	28	72
Piled up bills	8	20	77	9	62	176
Help from relatives	1	2	22	3	15	43
Moved to cheaper quarters	1	2	8	2	1	14
Other family member got job	6	1	9	2	16	34
Received public assistance	0	2	1	1	2	6
Sold car or durables	0	0	6	1	5	12
Used UC	49	53	229	36	86	453
Used SUB	55	58	249	29	25	416
Gainfully employed	6	11	50	31	177	275
Number of men	62	63	272	48	196	641

When financial experiences are divided into first and second layoffs, keeping in mind that the men on the first layoff were young and had a longer layoff period, it is plain that the measures considered here were not resorted to significantly more during the first layoff than during the second, except for use of UC, SUB and gainful employment. The main conclusion is that men in the first layoff depended a great deal on finding temporary gainful employment, and weathered the layoff successfully without resorting to extraordinary economic measures.

Table 34. Some Financial Experiences of Interviewed Employees Who Returned

Question	First Layoff		Second Layoff	
	Yes	No	Yes	No
Wife went to work	25	197	32	351
Children quit school	1	214	4	378
Education and training acquired during layoff	15	219	11	393
Decreased savings	112	122	220	185
Borrowed money	33	201	39	336
Piled up bills	71	163	105	300
Help from relatives	18	216	25	380
Moved to cheaper quarters	3	231	11	394
Other family member got a job	18	216	16	389
Received public assistance	3	231	3	402
Sold car or other durables	6	228	6	399
Used Unemployment Compensation	114	120	339	68
Used Supplemental Unemployment Benefits	45	189	371	36
Gainfully employed	208	26	67	340

For the first layoff of 493 men, 167 found other jobs and did not return to Ford; we interviewed 234 of the remaining 326, and 208 of them had jobs. It is reasonable to think that as high a proportion of the non-interviewed 92 men also had jobs because many of these, reporting back to Ford for re-employment processing arrived late in the day — as late as 9.00 p.m.

For the second layoff of 809 men, 53 never returned and 250 went back to work in September — so there were 506 men to interview. We interviewed 407 of them, 67 of whom had jobs and 340 did not. There is no reason to believe that more than 15% of the 99 not interviewed had jobs. Many of the men reported that they spent a substantial part of their layoff time fixing up their homes, working in their gardens, etc.

Table 35. Number of Employees Who Found Temporary Jobs
(Laid-off Employees Returning and Interviewed)

Place of Residence	First Layoff		Second Layoff		Total	
	Temporary Job	No Job	Temporary Job	No Job	Temporary Job	No Job
Windsor	124	9	40	273	164	282
Outside Windsor	84	17	27	67	111	84
Total	208	26	67	340	275	366

Virtually all the low seniority people we interviewed had found jobs, while only 10% (34 of 328) of the highest seniority people we interviewed had taken temporary jobs. This means that almost all the long layoff people — five months or more laid off — held jobs, while the short layoff people were not really interested in finding a job, which is understandable. When necessary the second layoff people did seek and find work. For example, Table 36 shows 67 jobs for second layoff men — 50 of these were held by men who were laid off for a period ranging from 16 to 20 weeks (see Table 33).

Table 36. Seniority of Employees Who Had Temporary Jobs
(Laid-off Employees Returning and Interviewed)

Number of Years' Seniority	First Layoff		Second Layoff		Total	
	Temporary Job	No Temporary Job	Temporary Job	No Temporary Job	Temporary Job	No Temporary Job
Less than one	98	1	0	0	98	1
1 to 2	99	16	2	0	101	16
More than 2, less than 17	10	9	32	12	42	21
17 or more	1	0	33	328	34	328
Total number of men	208	26	67	340	275	366

There is no indication that formal education was a factor in assisting the laid-off men to find jobs. What does come through is that the first layoff men are better educated than the second, but the younger workers had no trouble (regardless of any inadequacies in their education) because of a booming local economy. (At the time of layoff five representatives of the Windsor Board of Education visited Ford to advise soon-to-be-laid-off workers of the availability of training under Program 5 of the Technical and Vocational Training Agreement. Very few workers took advantage of this opportunity).

Table 37. Education And Temporary Employment
(Laid-off Employees Returning and Interviewed)

Education	First Layoff		Second Layoff		Total	
	Temporary Job	No Job	Temporary Job	No Job	Temporary Job	No Job
None	2	1	2	41	4	42

High School (3 to 5 years)	34	5	5	20	39	25
University (1 year or more)	5	0	0	2	5	2
Other	2	1	0	5	2	6
Total	208	26	67	340	275	366

Some of the first layoff men held as many as four jobs. Table 38 lists the jobs in descending order, using first job figures for first layoff as a criterion. The older men (as evidenced by first job, second layoff) tended to stay out of truck driving, construction work, and especially production work in other factories. The young men were able to get into other production work because there existed always the possibility that the man would be satisfied with his new work, and choose to remain with it. In contrast, the older, high-seniority man is almost certain to return to Ford.

Table 38. First And Second Temporary Jobs Held
(Laid-off Employees Returning and Interviewed)

Job Class	First Job		Second Job	
	First Layoff	Second Layoff	First Layoff	Second Layoff
Labourers (excluding agric.)	31	8	17	1
Production process and related workers	25	1	9	0

Fitters and assemblers — metal	6	6	6	2
Metal working machine operators	6	1	8	2
Shipping and receiving clerks	5	0	3	0
Carpenters	5	0	0	0
All others	55	36	24	2
Total	208	67	87	9

Most workers found a job within a month of layoff, many within one week. There were 57 men who said they went six weeks or longer before finding work, but 40 of them drew unemployment compensation, and some also drew SUB. Of the 17 without UC, 14 were laid off at the end of June. It is interesting to note that the majority of older workers found a job early in their layoff period, if they found a job at all.

Table 39. Number of Weeks Between Layoff And First Job
(Laid-off Employees Returning and Interviewed)

Number of Weeks	First Layoff	Second Layoff	Total
0 - 5	166	52	218
6 - 10	32	15	47
11 - 15	4	0	4
16 - 20	5	0	5
More than 20	1	0	1
Total	208	67	275

Half of the 208 men in the first layoff who held temporary jobs, kept them for almost the full layoff period. Table 40 shows that 107 men out of 208 held their first jobs for 16 weeks or more. More than a third of the second jobs (32 out of 87) were held for four months or more. Those on the second layoff held their jobs for briefer periods of time, although almost half the jobs were held for 11 weeks or more.

Table 40. Number of Weeks On Temporary Jobs
(Laid-off Employees Returning and Interviewed)

Number of Weeks on Each Job	First Layoff				Second Layoff

More than 20	86	15	4	1	3	0	0	—
Total number of men	208	87	22	6	67	9	2	—

Table 41 shows methods of finding the first job. Most interviewees stated that they found their own jobs (160 out of 275). The data in Appendix B-1 show the same tendency for jobs 2, 3 and 4. When broken down by layoff there is some indication that the workers in the second layoff relied more on the National Employment Service than did first layoff workers. For the most part the long-lasting temporary jobs were found by the men themselves. For example, 60 of the 160 jobs in the category "found by myself" lasted more than 20 weeks, while 18 of the 77 jobs found through NES lasted more than 20 weeks. (This is not a criticism of NES — quite the contrary, for 77 people found employment through NES, and these people might otherwise have been without work).

Table 41. Length of Temporary Job No. 1 And How Located
(Laid-off Employees Returning and Interviewed)

Source of Information	Number of Weeks on Job No. 1					Total Number of Men
	1 - 5	6 - 10	11 - 15	16 - 20	More Than 20	
National Employment Service	23	18	15	3	18	77
Friend	6	2	3	0	10	21
Newspaper	1	1	0	1	0	3
Myself	29	30	21	20	60	160
Other	4	2	5	2	1	14
Total number of men	63	53	44	26	89	275

More than half the men on the first layoff who returned and were interviewed, and who had had temporary jobs, did not use UC. Nearly 90% of them did not use SUB. On the second layoff the corresponding proportions are one-third for both UC and SUB. In each case, about half of those people with jobs who did draw UC or SUB did so for about five weeks.

Table 42 suggests that the pressure generated by low (or no) benefits forces people to seek work, especially when facing long layoffs. (See Table 43 also).

Table 42. Temporary Jobs And Number of Weeks of Unemployment Compensation And Supplemental Unemployment Benefits
(Laid-off Employees Returning and Interviewed)

Number of Weeks UC Drawn	First Layoff		Second Layoff		Total	
	Temporary Job	No Job	Temporary Job	No Job	Temporary Job	No Job

Total	208	26	67	340	275	366

Many of the men not using UC obtained other employment right away; in fact, many obtained another job before the actual layoff date. Some of the men who took more time to find a job used unemployment compensation. In all, 218 men had jobs within a month of layoff, and 123 of them did not use any UC at all after layoff. As time went by, a greater portion of ultimate job holders used UC. For example, 34 of the 47 men who found jobs six to 10 weeks after their layoff also used unemployment compensation.

Table 43. Unemployment Compensation And Number of Weeks Before First Job

(Laid-off Employees Returning and Interviewed)

Number of Men	Number of Weeks Between Layoff and First Job					Total Number of Men
	0 – 5	6 – 10	11 – 15	16 – 20	More Than 20	
Drawing UC	95	34	3	2	1	135
Not Drawing UC.	123	13	1	3	0	140
Total	218	47	4	5	1	275

Table 44 summarizes some of the highlights for a portion of the 641 men who were interviewed at recall time. The Table reflects a number of the experiences of those who were laid off longest for both first and second layoffs.

Table 44. A Comparison of Employees With The Longest Layoff

(Laid-off Employees Returning and Interviewed)

Less than 6 weeks	20	229	7	9

[a] For distribution of length of layoff see Table 30.
[b] Yes and no answers do not total 272 because some men refused to answer.
[c] Yes and no answers do not total 185 because some men refused to answer.

Summary

All Employees Laid Off and Returned

(1) General Comments — Age and Seniority — 1,082 Men

The first layoff was made up of young, low seniority men — two-thirds of whom returned to Ford; the second layoff was made up of older men, with much higher seniority — almost 95% of them were re-employed at Ford. Even in the first layoff, three-quarters of the men with one to two years' seniority returned.

(2) Use of UC and SUB by the Men Returning to Ford

(a) *First layoff*

About 25% of these men used both UC and SUB while laid off, 45% used neither, and the rest used one or the other (usually UC). For the most part (almost entirely) those who did not use either one, went to work elsewhere early in their layoff period, and stayed at work. For those who used UC about 40% got less than $30 a week for seven or eight weeks, while the rest got $30 or more (usually $36) a week for seven or eight weeks. Most of the workers (72%) never used SUB; those who did averaged $32 a week for seven or eight weeks.

(b) *Second Layoff*

About 70% used both UC and SUB; 15% used neither, and 15% used one or the other. Virtually all those who did not use either were recalled before their waiting period was up, and before they could legally draw benefits. Those who did use UC averaged close to $36 a week for 11

or 12 weeks; those who used SUB averaged $32 a week for 11 or 12 weeks.

(c) *Both layoffs*

Of the 1,082 men who returned, 267 did not use either UC or SUB while laid off — invariably because they had a temporary job (cf. Table 42); 327 men averaged $68 in combined UC and SUB benefits. These men account for 70% of the 1,082 men returning to Ford, the rest were distributed as shown in Table 28. For the first men laid off in June, benefits ran out about half way through the layoff period; for the second layoff, many men found their benefits lasting for the entire layoff.

(3) Recalled and Interviewed—641 Men

(a) *Length of layoff*

The men of the first layoff were off the job from five to seven months; for most of them it was closer to six or seven than to five or six. Most of the men of the second layoff were away from Ford for four months; for the rest it was two or three months, (but the first 250 recalled in September were not interviewed).

(b) *Financial experiences*

There is only very limited evidence of extreme hardship as measured by children quitting school, families losing homes or selling household furniture, appealing for public assistance, etc. Those affected by the second layoff lived for the most part on UC, SUB, and past savings; the first layoff people also relied on these resources, but most importantly they found gainful employment. The resources of UC, etc. would have run out for most men with only half the layoff period completed; if it had not been for a booming local economy, life for some could have become quite difficult.

(c) *Temporary Work*

Of the 1,302 men laid off, 220 never returned to Ford. Most of them had found other jobs. Of the 1,082 who returned, practically all of the men who wanted temporary jobs found them. We interviewed 234 of the 326 men of the first layoff who returned and 90% of them had been gainfully employed; 250 men of the second layoff had gone back to work at Ford in September, and of 506 other men who might have been interviewed, interviews of 407 showed less than 15% had found temporary jobs.

They went to all kinds of unskilled jobs, especially as labourers and production workers. The most striking contrast between first and second layoff was the inability of older men to get into production work in factories. Many of those who worked had a job within a week of layoff, and most had a job within one month. Many of the jobs were steady jobs; half the men who held jobs, held their first job for the full layoff period.

CHAPTER V

The 220 Men Who Were Laid Off and Did Not Return

SEVENTEEN PER CENT of the men laid off did not return — 167 from the first layoff, and 53 from the second layoff. We have information on these employees regarding age, marital status, seniority, pay classification at time of layoff, and the amount of unemployment compensation and supplemental unemployment benefits received from their layoff until late February 1966. The information is assembled in this Chapter.

Table 45 shows the percentage of each age group not returning to Ford. The age group 20-24 had the largest percentage not returning. These people were, of course, in the group to be laid off first.

The next age group, 25-34, had 78 of 243 men (or 32%) not returning from the first layoff, and 5 out of 47 in the same age group not returning from the second layoff. The largest group not returning in the second layoff was the oldest age group (65 to 69), when 21 men out of 69 laid off did not return.

The data in Appendix B-2 show that the largest group not returning were the single men laid off in June — almost half of them did not come back. By contrast, 93% of the single men laid off in August did return. The next largest group not returning were the married men laid off in June: 25% did not return, while all but 7% of the married men in the second layoff were re-employed.

Table 45. Number And Percentage of Each Age Group Not Returnnig

Age Group	First Layoff		Second Layoff	
	Number Who Did Not Return	Per cent of Age Group Not Returning	Number Who Did Not Return	Per cent of Age Group Not Returning
15 – 19	2	20.0	0	0.0
20 – 24	74	41.3	0	0.0
25 – 34	78	32.1	5	10.6
35 – 44	12	20.3	6	3.3
45 – 54	1	50.0	9	3.7
55 – 64	0	—	12	4.6
65 – 69	0	—	21	30.4
Total	167	33.9	53	6.6

The numbers of laid-off men not returning to Ford in each seniority group have been recorded for first layoff, second layoff, and for the total, in Tables 15, 19 and 10, respectively. The largest group not returning comprised 101 to 221 lowest seniority men laid off in June, 1965. From the same layoff 25% of those with one to two years' seniority did not return. In the second layoff virtually everyone who was physically able to return did so, except for those who retired.

Table 46. Number And Percentage of Each Seniority Group Not Returning

Number of Years' Seniority	First Layoff		Second Layoff	
	Number Who Did Not Return	Percentage of Seniority Group Not Returning	Number Who Did Not Return	Percentage of Seniority Group Not Returning
Less than one	101	45.7	0	—
1 to 2	63	25.4	0	—
More than 2, less than 17	3	13.0	8	12.3
17 or more	0	0.0	45	6.1
Total	167	33.9	53	6.6

The number of laid-off men not returning to Ford in each pay class has been shown for first layoff, second layoff, and total, in Tables 16, 20 and 12, respectively. Table 47 lists the number of men who did not return, by pay class, and the percentage of men who did not return out of the total number laid off in each pay class. The largest proportions of non-returnees were in the lowest pay classes in both layoffs. Thus, of the 69 lowest paid men in the first layoff ($2.39 an hour or less), 56 did not return.

Table 47. Number And Percentage of Each Pay Class Not Returning

$ per Hour	First Layoff		Second Layoff	
	Number Who Did Not Return	Percentage of Seniority Group Not Returning	Number Who Did Not Return	Percentage of Seniority Group Not Returning
Less than 2.34	0	0.0	4	66.7
2.34	43	84.3	0	—
2.39	13	76.5	1	100.0
2.44	47	29.9	25	11.0
2.49	20	23.8	8	4.7
2.54	40	27.0	13	4.2
2.59	2	10.5	0	—
2.64	2	13.3	2	6.1
More than 2.64	0	—	0	—
Total	167	33.9	53	6.6

Over 70% of the first layoff and 40% of the second layoff did not draw either UC or SUB benefits. About 10% of the first layoff and 30% of the second received both. The remainder used one or the other: more commonly, UC in the first layoff and SUB in the second.

Table 48. Employees Who Did Not Return But Drew Unemployment Compensation And Supplemental Unemployment Benefits

Combination of UC and SUB	Number of Employees		
	First Layoff	Second Layoff	Total
Drew both UC and SUB	17	16	33
Drew UC only	26	1	27
Drew SUB only	4	15	19
Drew neither UC nor SUB	120	21	141
Total	167	53	220

Three-quarters of the men laid off in June and not returning did not use unemployment compensation at all during the period June, 1965 to February, 1966; most of the rest of those in the first layoff drew compensation for five weeks or less. About two-thirds of the personnel involved in the second layoff not returning did not use UC from August, 1965 to February, 1966, while most of the rest drew compensation for up to 10 weeks.

Table 49. Number of Weeks Unemployment Compensation Drawn By Employees Who Did Not Return

Number of Weeks Drawn	First Layoff		Second Layoff		Total	
	Number of Employees	Per cent	Number of Employees	Per cent	Number of Employees	Per cent
0	124	74.2	36	67.9	160	72.7

More than 20	2	1.2	1	1.9	3	1.4
Total number of men	167	100.0	53	100.0	220	100.0

Of the 43 men from the first layoff who did not return, but used UC during the layoff period, 28 received benefits for five weeks or less — 16 of these drew less than $30 per week. Of the 17 men from the second layoff who did not return but used UC during the layoff period, seven received benefits for five weeks or less, and 12 for 10 weeks or less. Seven of the 12 drew less than $30 per week, and five got more.

The average man in the first layoff who did not return, drew unemployment compensation of $27 a week for five weeks or less. Table 50 shows that the numbers are so small for the second layoff that it is meaningless to generalize beyond the statement that there was a tendency for the average man in the second layoff to get a little more for a somewhat longer period.

Table 50. Amount of Unemployment Compensation And Number of Weeks Drawn For Employees Who Did Not Return — First And Second Layoff

Total	22	7	21	10	43	17

Almost 90% of those in the first layoff and not returning did not use SUB, and most of those who did use it drew benefits for five weeks or less. Over 41% of those in the second layoff who did not return did not use SUB, and 15% drew benefits for five weeks or less.

In the first layoff there were 21 men who used SUB and did not return to Ford, while in the second layoff there were 31. The most frequent combination of number of weeks and amount was one to five weeks and $28 to $35. This occurred for 10 men of the first layoff.

It is difficult to pick a representative combination for men of the second layoff because the numbers are small and scattered; probably $32 a week for three months is typical.

Summary

It was the young men who did not return to Ford, although in the second layoff some of the older men did not return. Also, in general, it was the first-layoff men who did not come back, e.g., half the single men laid off in June did not return but only 7.4% of the single men laid off in August did not return; 25% of all married men on the first layoff were not re-employed, but only 7% of the married men on the second layoff. Similarly the low seniority and lower pay class men did not come back to the degree that higher seniority and higher pay classes returned.

One-third of those in the first lay-off were not re-employed, and these 167 men were three-quarters of the 220 who did not return out of a total layoff of 1,302. In general these men were young, single, low seniority and in a relatively low pay class.

What happened to these men? Most of them went to work right away. Seventy-five per cent of the first layoff not returning did not use unemployment compensation at all, and most of the rest got $27 a week for about a month; figures for the second-layoff non-returnees are approximately the same, with a little more compensation for a somewhat longer period. Most of the men who did not return did not receive SUB in the layoff period; those who did got about $32 a week for one month, (if first layoff), and for three months, (if second layoff).

Where did these men go eventually? Some of them left Windsor. Some retired. But most found jobs in the Windsor area. Appendix F gives the last NES referral for 66 of 220 men. On the basis of last referral, most of them found work as labourers in other auto plants, feeder or parts plants, or in a related company.

APPENDIX A

Numbers of Laid off, Recalled, Interviewed and Re-employed Workers

Total number laid off		1,391
Laid off twice and now working at Ford	71	
Laid off twice and did not return	15	
Interviews not counted because invalid	3	89
TOTAL LAYOFF for this Report		1,302
FIRST LAYOFF:		
Recalled, interviewed and re-employed	234	
Recalled, not interviewed, and re-employed	92	
Recalled but not re-employed	167	493
SECOND LAYOFF:		
Recalled, interviewed and re-employed	407	
Recalled, not interviewed, and re-employed	349*	
Recalled but not re-employed	53	809
TOTAL first and second layoff		1,302

TOTALS:		
Total interviews		641
Total recalled but not interviewed		441*
Total laid off and re-employed —		
First layoff	326	
Second layoff	756	1,082
Total laid off and not re-employed —		
First layoff	167	
Second layoff	53	220
GRAND TOTAL (i.e., total layoff)		1,302

*250 of these men were not interviewed because, since they were re-employed during September (following layoff in mid-August and a two or three-week vacation for the last part of August and early September), they were not subject to the layoff experiences we wished to investigate. Therefore, there were 99 men on the second layoff we might have interviewed and did not, compared to 92 men on the first layoff who were not interviewed.

APPENDIX C

Unemployment Compensation

UNEMPLOYMENT COMPENSATION (UC) is an insurance program operated by the Federal Government under the Unemployment Insurance Act of 1955, as amended. The plan is contributory (employees and employers contribute equally to the insurance fund and government contributes 20% of cost); the contributions by workers range from a low of 10c per week (for employees making up to $8.99 per week) to a high of 94c per week for employees making $69.00 per week or more. Thus, all Ford employees with whom we are concerned are contributing 94c, since their lowest hourly rate is over $2 per hour.

Such contributions entitle a worker, if he becomes unemployed, to draw benefits of $27 per week (if single) and $36 per week (if married), provided he meets certain length-of-service requirements. A number of employees — particularly in the first layoff — may have received weekly benefits somewhat lower than the above. The amount of benefit is based on the average rate of a worker's most recent 30 contribution weeks in the last 104 weeks. Thus, those who had just recently joined Ford, and some of those whose contributions were predicated on rates of pay below $69.00 per week (as may have been earned on another job), would not receive the maximum benefits as outlined above.

APPENDIX D

Supplemental Unemployment Benefits

SUPPLEMENTAL UNEMPLOYMENT BENEFITS (SUB) are payments made to laid-off workers in addition to those they receive by way of Unemployment Compensation. While the latter is government operated, the former arise out of contractual agreements between company and union.

In the case of Ford of Canada, the company puts into a Supplemental Unemployment Benefit Fund 5c for each hour worked by hourly-rated personnel. When unemployed, workers draw from this fund, on a weekly basis, enough to pay them (together with Unemployment Compensation) 62% of their straight-time weekly wages for a period not to exceed 52 weeks. In addition, they are paid $1.50 per week for each dependent, up to a maximum of four. The so-called "regular benefits" from SUB may not exceed $50 per week (plus the dependency allowance).[1]

Eligibility rules include the requirements that the laid-off worker:

1. Has at least one year of seniority with Ford.
2. Be eligible for UC (with limited exceptions) and registered with NES.
3. Be not laid off for disciplinary reasons.

The fund is administered by an independent trustee. Company liability under the agreement is limited to monies contained in the fund, plus the obligation to continue contributions at the agreed-upon rate for each hour an hourly-rated employee works.

[1] There are other benefits for short work weeks. and there are lump-sum separation payments, We are not concerned with these in this Report.

APPENDIX E

Transitional Assistance Benefits

TAB IS THE common abbreviation for Transitional Assistance Benefits, a Federal Government program which provides financial assistance for workers in automotive and automotive parts industries, who are laid off as a result of the Canada-United States Automotive Trade Agreement. Benefits for the workers we are concerned with here, would be not less than 62% of their weekly wage plus $1.50 per week for each dependent, up to a maximum of four. The following eligibility requirements apply:

(a) a worker must have had no less than 30 weeks employment in the last 52 weeks in the industry, and

(b) must be qualified to receive Unemployment Compensation, and

(c) layoff must have been due to the Automotive Trade Agreement . . . which was the case with the personnel here considered.

Benefit duration is predicated on length of employment in the industry. Those with 30 weeks of service receive four weeks' benefit, with an extra week of benefit for each week worked over 30. Maximum allowable weeks of benefit is 52 (78 in the case of trainees).

TAB is a *supplement* to UC, not a substitute. Since TAB benefits reduce the contributions automotive companies are required to make under SUB agreements, the Federal Government "requested" that these companies (among them Ford of Canada) contribute to the TAB fund monies equivalent to the SUB benefits they would have paid, otherwise no TAB benefits would be available to employees of such companies. (The SUB equivalency contribution requirement does not apply to companies who have no SUB plan — their workers are eligible for TAB provided they meet the other requirements of the plan). Ford of Canada, a company which has an SUB plan, chose not to contribute to TAB.

Evaluation of Your Cooperative Part-Time D. E. Program

Standards which are essential to the successful conduct of a sound program of training for boys and girls who seek careers in the distributive occupations have been recognized and established. School administrators are aware of the values of unbiased evaluations as a means of maintaining standards and increasing effectiveness of the school's program.

This material has been developed to present to school administrators and distributive education personnel a few of the fundamentals conducive to sound training. Acknowledgment is made of similar material prepared by the Distributive Education Service of the Texas Education Agency, and the Southern Regional Conference for Distributive Education from which this material was prepared. The sole purpose of this evaluative device is to assist in improving your program.

BASIC CONCEPTS

1. Age of Students: In order to assure that the more mature students benefit from the distributive education program, and to meet all legal requirements, all beginning students applying for admittance into the program must be at least 16 years of age.

2. Preference for Junior Students: The coordinator should make a conscious effort to prefer junior students. This effort recognizes that two years of training is necessary to give students a thorough grounding in the principles of distribution. Also, the two-year program insures sufficient individual and on-the-job training to give students well-rounded training.

   Number of Junior Students _____ Number of Second-Year Distributive Education Students . . . . _____

   Number of Senior Students _____

   Comments:

3. Working Hours of Students: The coordinator should know the total number of hours worked by each student. Each student must work a minimum of 15 hours per week to justify the practical training requirement. At the same time, a student working more than a total of 30 hours per week might suffer both physically and scholastically.

4. Distributive Occupations: In order to assure students of a sound instructional program built around a teachable area of information, placement of students should be confined exclusively to phases of retail, wholesale and service-selling businesses which are distributive in nature. These jobs should offer ample opportunity for training to fit for useful employment and advancement after graduation.

Basic Concepts (continued)

5. Enrollment and Attendance: All students should be regularly enrolled in school, and when absent, either from school or job, the coordinator should follow up to see that the absence is justified and that the training sponsor has been informed by the student of the reason for the absence. Employers should agree that unexcused absences from school will be cause for termination of on-the-job training.

6. Teacher Load: Time should be provided for the coordinator to do a thorough job of preparing individual lesson projects for students, and to permit close coordination between the student's work and school activities. Additional non-teaching duties assigned to the coordinator should promote the overall welfare of the program and not be detrimental to its development. Also, the size of the distributive education program should be limited sufficiently to provide adequate time for individual instruction.

Morning schedule:

Afternoon schedule:

Extra-curricular assignments:

Comments:

PHYSICAL FACILITIES

1. The Classroom: The distributive education classroom should be in a desirable location. Because of the emphasis placed upon research and written projects, particular attention should be given to proper lighting. The room should be neatly arranged, and should present a clean and orderly appearance at all times.

2. Furniture, Fixtures, and Equipment: In order to do an efficient training job the coordinator should have the necessary tools with which to work. Listed below are basic items which have come to be regarded as standard:

Item	Yes	No
Tables and chairs are provided in order to give students ample work room for projects	_____	_____
Room has adequate blackboard space. . . .	_____	_____
Room has adequate bulletin board space. .	_____	_____
Room is equipped with book shelving for library	_____	_____
There is an adequate filing case or cabinet for teacher use and for student use	_____	_____
Storage space has been provided for supplies	_____	_____
Coordinator has access to a typewriter and to a duplicating machine	_____	_____
Coordinator has access to projection equipment suitable for showing training films to students	_____	_____
A wrapping counter and cash register are available for teaching students basic fundamentals of cashiering and wrapping	_____	_____
A model store unit is being used in the classroom to enable the coordinator to teach through demonstrations	_____	_____

3. Supplies: Materials such as wrapping paper, twine, salesbooks. and actual or dummy merchandise are invaluable to the successful training of distributive education students and should be used by the coordinator in classroom instruction.

   Comments:

   Miscellaneous supplies such as stationery, stamps, stencils, and other stationer's items should be available to the coordinator in order that he may continually contact manufacturers, trade associations, and other sources of up-to-date training material and literature.

   Comments:

LIBRARY

1. General Reference Books: The well-rounded distributive education library should have a minimum of twelve books of a general nature on merchandising, retailing, store system, and other fundamentals of distribution. The books should be located in the distributive education classroom, and should be frequently used both by the coordinator and students. General reference books may be purchased through the general school library and charged out to the distributive classroom. Such books will have value in other subjects in the school.

2. Books for Specific Occupations: In order to make distributive education training as specific and valuable as possible, the coordinator should requisition books for each occupation represented in the class. After the program has been in operation for two or three years, all of the major occupational areas should be represented in the library, making it possible for the coordinator to add new books and other instructional materials of a specific nature as they are needed.

3. Trade Journals: Students should have access to basic trade journals as a means of keeping themselves informed about new developments and trends within their particular occupation. These journals should be available in the distributive education classroom. Many publications of value may be secured without cost from local cooperating firms.

4. Pamphlets: Manufacturers' Literature: Current materials obtained from manufacturers, producers, and various association groups should be on file for use by students studying their various occupations. This type of material should be kept up to date, and should be organized for handy reference and easy use.

5. Inventory Bibliography: The teacher-coordinator should maintain an up-to-date inventory of the library and should also maintain a current file of bibliographical material and sources for reference.

6. Exchange of Materials: The coordinator should develop a cooperative inter-change of materials between the school and business. Training sponsors should loan or give the coordinator specific materials which come to their attention, and the coordinator should make available to sponsors, on a loan basis, good material which comes to his attention.

7. Visual and Audio Aids: The instructional program should be supplemented by the use of charts, posters, bulletin board materials, films, recording machines, and other visual and audio aids available through school and business sources.

8. Departmental Manuals: Specific individual workbooks for students have been prepared as an aid to distributive education coordinators. These workbooks are available in separate occupational fields, such as: Hardware and Housewares; Men's Wear; Receiving-Checking and Marking, and Merchandise Display. The coordinator should have as a part of the D. E. library those workbooks which pertain to occupations in which his students train.

SELECTION AND PLACEMENT OF STUDENTS

1. Guidance of Students: Distributive Education is a program designed for students who want, need, and can use the training given in retail, wholesale, and service jobs. Students whose interests lie in other fields should be guided into other school activities. In this respect, it is regarded as wise to make a number of the following contacts concerning each individual:

	Yes	No
Check with guidance counselors	_____	_____
Investigate student's grades in other subjects	_____	_____
Talk with other teachers about interests	_____	_____
Check with any former employers	_____	_____

Comments:

2. Individual Interview: There is much to be said for recommending personal interviews between the teacher and prospective applicants. Preferably this interview should stem from some sort of application blank which the student fills out, and from which other questions may be asked by the teacher. It is desirable that parents should be invited to accompany students to the interview and in every case should participate in the final decision reached concerning enrollment and placement.

3. Placement on Appropriate Jobs: As a general rule, distributive education students receive better training and show more interest in the program when the coordinator is responsible for finding the training station and placing the student in the proper job. When the program is made up of students who already have jobs, there is generally a tendency for the program to be regarded as a "work" program and not as a training program.

   What percentage of students enrolled were already working when they applied for admission to the program . . . . . _____

Selection and Placement (continued)

Was program explained to employers of these students before they were admitted to the program? . . . . . _____

Were these training stations thoroughly approved by coordinator before student was accepted into program? . . . . . _____

What percentage of students, after enrollment, found their own jobs without help of teacher-coordinator? . . . . _____

What percentage of students did coordinator place? . . . . . _____

Comments:

4. Technique of Placement: Stated below are some principles which have contributed to sound placement:

Some system of giving the student training in "how to apply for a job" and in grooming principles should be developed and used by the coordinator before referring any student for placement.

Applying for a job is recognized as a training experience, and it is desirable for students to be directed to apply to several employers upon entering the program.

Generally, it is best for the student to go alone when applying for the job, perhaps carrying a note from the coordinator or some type of introduction card.

The coordinator should assume responsibility for arranging interview date with the employer and for following up on results of interviews. Preferably, the coordinator should be the one to inform students that they have been chosen for a job.

COOPERATIVE TRAINING STATIONS

1. Emphasis on Training: The interest of the student should be protected by careful placement within the distributive field. The jobs are training jobs, and employers should realize that they have a responsibility for training. Employers should see that students receive adequate instruction in each phase of work to which they are assigned.

2. Desirability of Occupations: All cooperating training stations should be reputable business firms. The jobs on which students receive training should lead to desirable careers and should not be "dead end" jobs which do not provide opportunity for the student to make an adequate living after graduation.

3. Use of Training Memorandums: Cooperating businessmen should be familiar with the objectives of distributive education training. As one means of assuring logical and well-rounded training of maximum benefit to both employers and students, employers should aid in the completion of training memorandums, and the coordinator should see that each businessman has a signed and approved copy of a training memorandum for each student working for him.

4. Wages Paid Trainees: The distributive education student should receive fair compensation for the work which he does. There should be no exploitation of any distributive education student; and the businessman and coordinator should work out some plan whereby the wages paid provide the student an incentive to apply himself in the training program and to work for advancement.

5. Continuity of Employment: In order for training objectives to be attained, the cooperating sponsors should agree to employ the trainees throughout the school year. Distributive education students should be regarded as valuable, regular employees in a training status, and not as part-time extras subject to seasonal layoff.

6. Rating and Review: Store managers and training sponsors should cooperate closely with the coordinator in pointing out training in school needed by the students and should assist in placing a periodic evaluation upon the progress and achievement of student trainees in the on-the-job phase of the training program.

7. Ability and Interest of Student: Students should be placed in training stations which offer a challenge to their abilities and interests. The sponsors should provide guidance and on-the-job training which will result in the student's being capable in the work for which he is being trained.

8. Balanced Training Program: The coordinator should strive to place students on jobs throughout various types of distributive businesses in order to avoid too many students in a restricted number of occupations or in a few firms.

9. Training Sponsors: The cooperating firm should designate a competent person to sponsor the training of each student and to direct his work for maximum training values. The coordinator should work with each sponsor to insure his understanding of his responsibility as sponsor and as to best current practices in training.

COORDINATION

1. Frequency of Coordination: In order to keep close check on the students' progress, and in order to determine their training needs, the coordinator should make one contact per week, as an average, with training sponsors who supervise the students' daily performance on the job.

2. Purposeful Coordination: Coordination contacts should always be purposeful. Such objectives as determining training needed by students, informing employers regarding program purposes, securing instructional materials, showing sponsors the results of student work, arranging rotation to other training activities, learning of the employer's opinion regarding proper job grade for students, plus other objectives, should always be evident to the coordinator and employer.

3. Planning Training: The coordinator should work with employers and training sponsors to the end that the student follows a planned training program. There should be evidence that job analyses, student progress charts, daily coordination records, and other media for accomplishing sound training are being effectively used.

4. Levels of Coordination: The coordinator should recognize the importance of working closely with the student's immediate superior in order to learn of the daily needs of the trainee and of his performance. At the same time, the coordinator should not lose sight of need for occasional contacts with top management since it is necessary to establish and maintain policies which call for student rotation, pay increases, and similar matters which can only be determined by top management.

5. Use of Information: The coordinator should incorporate into the school training such activities and information as may be needed to improve and correct practices which are discovered through coordination contacts.

6. Work with Parents: The coordinator should contact the parents of the students in order to secure a better understanding of the background and needs of the student learner.

7. Development of New Training Stations: The coordinator should follow a definite plan for educating managers of distributive businesses (not cooperating with the program) as to the objectives and benefits of distributive education. Managers of cooperating firms, as well as those who may cooperate in the future need to be reminded of the purposes of the training program.

8. Follow-Up: The coordinator should make follow-up studies of students who have graduated from the program in order to see how the program is serving graduates and in order to improve the efficiency of training offered in distributive education classes.

USE OF RECORDS

1. Daily Coordination Itinerary: For the purpose of keeping the principal or superintendent informed, and in order that telephone calls from store managers might be completed, the coordinator should make a practice of filing with the proper administrator an itinerary of proposed coordination contacts each day.

2. Daily Coordination Record: The coordinator should maintain a record of results of daily coordination contacts in order to: (1) plan future contacts, (2) help keep all coordination objective, (3) keep administration informed as to the purpose and accomplishments of coordination work.

3. Training Memorandums: Training memorandums, signed by student, parent, employer, and coordinator should be completed in order to: (1) protect the school and employer with a statement signed by parents indicating a knowledge that the student is working in a position acceptable to them, (2) indicate that the sponsor has had a thorough explanation of the program and understands his responsibilities, (3) justify the training to be given as worthy of school credit, and (4) insure well planned, objective training which results in obvious improvement in employee efficiency.

4. Permanent Records: The coordinator should have a permanent record on each student, recording grades, job performance, and other pertinent data in order to provide a sound basis for answering letters of inquiry and reference, and in order to provide records for coordinators who might at some future date be responsible for the program.

5. Individual Progress Record: The coordinator should have a progress record on each student, indicating the beginning jobs on which training is required and projecting future training which will be given each student during ensuing months ahead. Such a system is necessary to keep employer, student, and coordinator aware of achievement and progress to be made. The coordinator and employer should work cooperatively in the development of this record; and it should always be six weeks or two months "ahead" of the student's present training needs.

Use of Records (continued)

6. Planning Calendar: The coordinator should follow a calendar of activities planned at the beginning of the year, including amount of time scheduled for various topics of instruction, scheduling of special class activities, and other items making for a balanced program of instruction.

7. Student Daily Report: The coordinator should require each student to fill out daily a report on his activities on-the-job for the previous day, the hours worked, and amount of sales if in a selling capacity. This report should be summarized weekly and include total earnings. Students who are in sales work should compute their selling cost each week.

INSTRUCTION

1. Course of Study: Distributive Education coordinators, working cooperatively, developed and approved suggested study guides for the first and second year students. These study guides are not designed to be complete lesson plans, but are suggestive of content, and establish a pattern which results in a logical presentation of content to the student. The guides, listed below, should serve as the pattern for group discussions; and the year's time should be budgeted to permit the coordinator to teach the basic essentials in each area.

UNIT OF INSTRUCTION - 1ST YEAR

1. ORIENTATION
   a. My Store and My Job
2. PERSONALITY DEVELOPMENT AND HUMAN RELATIONS
3. THE SELLING PROCESS
4. FUNDAMENTALS OF ADVERTISING AND DISPLAY
5. STORE ORGANIZATION AND OPERATION
6. SHRINKAGE AND STOCK CONTROL

UNIT OF INSTRUCTION - 2ND YEAR

1. DEVELOPMENT OF RETAIL STORES
2. THE SELLING PROCESS
3. ECONOMICS OF DISTRIBUTION
4. MERCHANDISING AND STOCK CONTROL
5. SALES PROMOTION THROUGH ADVERTISING AND DISPLAY
6. RETAIL CREDIT AND COLLECTIONS
7. CAREERS IN DISTRIBUTION

Instruction (continued)

Comments:

2. Use of Lesson Plans: Distributive education coordinators should use lesson plans. The lesson plans should be written. They should be prepared well in advance of need. The plans should be filed, available for review, and re-worked each year to strengthen weak areas and to delete material which has become out-dated.

3. Individualized Instruction: One of the most fundamental vocational education concepts is that approximately one-half of the time in the classroom should be spent by the individual student in well-directed and well-organized study of his specific occupation -- in the study of the job which he is actually performing. This process gives the student a sense of accomplishment; it forms habits of study which will help the student to advance in future jobs; it is likely to result in visible evidence to the employer and student supporting the value of distributive education training.

4. Pertinence of Instruction: The coordinator should teach in terms of everyday, practical situations which apply to the local business community. The individual assignments given to students should likewise apply to their everyday needs and to the requirements of the job on which they work.

5. Instruction on the Job: The coordinator should work with training sponsors in order that they will understand their responsibility for giving the student supervised instruction on the job. Sponsors should also have a general knowledge of the student's school program in distributive education. Also, when the opportunity presents itself, the coordinator, with management's consent, should give the student training on the job.

Instruction (continued)

6. Use of Job Analysis: Individualized instruction should be based on analysis of the individual job. The compilation of such analyses is an outgrowth of the coordination activities, and the analyses should be incorporated into the individual assignments and projects given to the students.

7. Use of Departmental Manuals and Other Prepared Materials: Many manufacturers, trade associations, and book publishers furnish teaching materials which apply to specific jobs. The cooordinator should make the problems presented in these materials realistic in the light of local business conditions and job needs of the student.

8. Student Notebooks: Students should be encouraged to develop notebooks containing a complete record of their achievements in pursuing individualized work. These notebooks should reflect study and application on the part of the student, and students should take pride in them. These notebooks should also be shown to employers and training sponsors, both as a means of informing the employer regarding the student's work, and as a means of encouraging the student to do better work.

9. Methods of Instruction: The distributive education teacher should take advantage of the nature of the subject matter presented in distributive education and carefully choose the most effective method of presentation. Lectures should be kept at a minimum. Demonstrations, group conferences, discussion, guest speakers, and audio-visual presentations should receive especial emphasis.

10. Classroom Management: There should be evidence that the teacher follows a systematic, well-organized pattern of class leadership. Individual work assignments should be handled in a businesslike manner, and there should be a good working relationship between the students and the teacher.

11. Development of Instructional Materials: Because of the specific, individual nature of effective distributive education teaching, the teacher should have an interest in securing, adapting, and developing instructional materials. Evidences of this interest should show that the teacher is making a conscientious effort to teach the student information, skills, and attitudes which apply to the specific job which he holds.

12. Evaluation of Instruction: The teacher and training sponsor should make periodic evaluations of the ability of the student to apply the things which he has learned. Insofar as possible, this evaluation should be based on standards of achievement recognized as acceptable in business.

ADULT EDUCATION

1. Alertness to Needs for Adult Courses: The coordinator should feel a responsibility for bringing sound retail training to employed adults and managers of distributive businesses. He should constantly be alert to the needs in this area and should, when possible, originate requests for extension teachers or seek out local instructors in order that the need for adult training might be met.

2. Classes Taught by Local Instructors: In order to be helpful to retailers in solving basic personnel problems, the coordinator should organize and teach some basic adult courses. These courses might be conducted either by the coordinator himself or by some person respected locally for his knowledge and ability. Such courses as "Sales Training for Christmas Extras," "Gift Wrapping," and similar basic courses are of real service to the business community.

3. Sponsorship of Adult Training Courses: The coordinator of distributive education should sponsor and participate in the organization of extension courses offered to the adult employees and managers of distributive businesses. Such sponsorship is a means of extending the vocational service offered by the public school and results in an increased respect for the coordinator.

PROFESSIONAL ATTITUDES

1. Membership in Professional Organizations: The coordinator should be interested in the professional aspects of teaching and should be a member of professional organizations which serve teachers. The coordinator should affiliate himself with business organizations related to his program whenever it is possible for him to do so.

2. Cooperation with School-Wide Professional Growth Activities: The distributive education coordinator should attend all faculty meetings and avail himself of all in-service improvement programs established by his school system for teacher-betterment.

3. Handling of Mail and Telephone Calls: The coordinator should promptly answer all incoming correspondence or other messages which require an answer. He should also be particularly careful to reply promptly to all telephone messages.

4. Professional Improvement: The teacher should have a spirit of willing cooperation in the matter of attending statewide teacher training conferences and other meetings which are designed for the benefit of teachers. He should believe in the value of renewing his occupational experience and should take advantage of every opportunity to add to his occupational knowledge by returning to work in some distributive occupation.

5. Developmental Work: The coordinator should be interested in instructional material development, and should be actively engaged in upgrading the quality of instructional material which he is using. In addition, he should make contributions to professional magazines, trade magazines, or other publications of interest to co-workers.

PUBLIC RELATIONS

1. Advisory Committee: The school administration should appoint a distributive education advisory committee, composed of both businessmen and educators, to advise with the distributive education coordinator concerning the program. Meetings of this committee should follow a prepared agenda. Members of the committee should be very interested in the distributive education program. The committee should help with sponsorship of adult education classes, as well as high school classes.

2. Administration: The coordinator should follow proper administrative channels in all that he does. In addition, the coordinator should invite administrators to participate occasionally in classroom and coordination activities. He should file with his principal or superintendent an itinerary of his daily coordination calls and should keep the administration fully informed on pertinent details concerning the program.

3. Faculty Members: The distributive education coordinator should work closely with other faculty members, and other faculty members should have a cooperative attitude toward the distributive education program. In recognition of the fact that he is a faculty member, the teacher coordinator should willingly accept those extra-curricular assignments which might be given to him, and which are shared equally by all members of the faculty.

4. Businessmen: In carrying out his coordination activities, the coordinator should impress businessmen with his willingness, and the willingness of his school, to be of service to the community. He should follow all proper rules of good business in working with businessmen to the end that he is respected by them as being an effective person.

5. Publicity: The distributive education program should be publicized through a well-balanced program, involving the various publicity media available in the community. The publicity should be well planned, and should function throughout the school year.

Public Relations (continued)

6. Participation of Businessmen: The coordinator should make every effort to involve businessmen in the program by inviting them to help with classroom instruction, by securing instructional material from them, by loaning instructional material to businessmen, and by having them take an active part in all activities of the program.

7. Total School Program: The coordinator should make every effort to acquaint all people with the real values and offerings of the total public school program. Factual evidence of progress of the public schools should be presented to combat attempts to limit the effectiveness of American free public education by elements working against the American way of life.

Pub Date - Jan66 60p.

*OCCUPATIONAL SURVEYS; *EMPLOYMENT OPPORTUNITIES; LABOR FORCE; EMPLOYER ATTITUDES; *EMPLOYMENT QUALIFICATIONS; EMPLOYMENT STATISTICS; EMPLOYMENT TRENDS; *HIGH SCHOOL GRADUATES; EDUCATIONAL NEEDS; OCCUPATIONAL INFORMATION; JOB SKILLS; OCCUPATIONAL CLUSTERS; *VOCATIONAL EDUCATION; ON THE JOB TRAINING; YOUTH EMPLOYMENT
CONNERSVILLE, INDIANA

A survey of employers determined the skills and knowledge needed by vocational or high school graduates to qualify for jobs suitable for inexperienced youth. The results were to be used by school officials in establishing a curriculum for a proposed area vocational training center. Employers listed a total of more than 100 different types of skills, knowledge, or personal attributes required for qualifying youth in the various suitable entry jobs. Growth was predicted in most of the occupations for which youth could be trained. Adjustment of vocational facilities was strongly indicated to meet the increasing employer needs for skills associated with the jobs in the machine trades, crafts, and manual work occupations. In addition, training in the closely allied skills of welding, sheet metal, shop mathematics, blueprint reading, and the use of precision instruments appeared appropriate. The heaviest concentrations of jobs suitable for youth were in occupations in the manufacturing processes while a significant number were in white collar and service occupations in nonmanfacturing industries. Since many jobs involved multiple skills, it is important to study the skill needs along with the job needs in order to relate the two. Details of the methodology and tables of jobs and requirements are included in the appendix. (HC)

WHITEWATER VOCATIONAL SCHOOL

TRAINING SURVEY

INDIANA EMPLOYMENT SECURITY DIVISION
Research and Statistics
10 North Senate Avenue
Indianapolis, Indiana 46204

January 1966

PREFACE

The Whitewater Vocational School Training Survey was initiated by Superintendent of Schools, John M. Hougland of the Fayette County School Corporation and was conducted by the Connersville local office and the Research and Statistics Section of the Indiana Employment Security Division. Its purpose was to determine what skills and knowledge would be needed by vocational or high school graduates to qualify for jobs suitable for inexperienced youth. The results of the survey of employer needs in Fayette, Franklin and Union Counties and Cambridge City (Wayne County) will be used by school officials as a guide in establishing curriculum for a proposed area vocational training center.

Improving the employability of young high school graduates by providing suitable vocational training facilities is vital, especially at this time when the number of youth entering the labor force is increasing and unemployment among youth is at a high level. The training of young entrants to the labor force to meet the hiring needs of employers is of essential concern to business establishments whose growth potential can be realized through the availability of a labor supply trained in specific skills to meet their demands.

The cooperation of those employers who took time from busy schedules to complete the survey forms is greatly appreciated. A number of them expressed enthusiasm for an area vocational school and contributed positive suggestions in support of this project as proposed for the Connersville area. It is heartening to note the cooperation between the school system and the area's business community; their awareness of interdependence and the need for planning should prove to be of great value to the entire community.

The members of the Connersville Chamber of Commerce and the local school system officials, John M. Hougland and Robert Hoffman, should be commended for their efforts in support of the survey.

Under the provisions of the Vocational Education Act of 1963, the identification and reporting of area training needs to the Vocational Education Department is the responsibility of the Indiana Employment Security Division. The following study was made to meet this responsibility.

SUMMARY

In the Connersville area's growing industrial economy, there will definitely be entry jobs for qualified young people. Growth was predicted in most of the occupations for which youth could be trained. An adaptive educational system geared to prepare a labor force to match the requirements of a wide variety of available jobs is clearly indicated with recognition that this can benefit the prosperity level of the entire community. Close communication between business and schools should be maintained to provide a continuous exchange of career information.

Surveyed area employers estimate that by 1967 their expanding needs will provide 1,182 additional job openings in occupations for which inexperienced youth could qualify. The number of jobs which youth could fill will increase further by 1970. Many of the jobs require multiple skills. Employers listed a total of more than 100 different types of skills, knowledge or personal attributes required for qualifying youth in the various suitable entry jobs.

Adjustment of vocational facilities designed to meet the increasing employer needs for skills associated with the jobs in the machine trades, crafts and manual work occupations are strongly indicated. (The bulk of the jobs in the manual work group are for production workers, including semiskilled machine operators, and involving some manipulative skills). Jobs listed by employers as most numerous involve skills in metal-machine operating (including set-up), machine shop, blueprint reading, and the use of precision instruments. In addition, training in closely allied skills such as welding shop, sheet metal work shop and shop mathematics would appear appropriate.

Although the heaviest concentration of jobs suitable for youth, currently and in the future periods covered by the survey, were reported in occupations in the manufacturing process; a significant number of jobs in white collar and service occupations in nonmanufacturing industries were reported as suitable for youth. The data presented in the tables in the Appendix adhere solely to that gathered from the employer survey forms. Since nonmanufacturing firms are more numerous and usually smaller than manufacturing firms, needs are more widely scattered, more varied in skill requirements and more difficult to assess. The current and future jobs in the trade and service industry divisions, particularly, are understated in this report because of this diffusion of employment and the survey coverage. Therefore, we recommend that when referring to survey data by industry group, Table II, the added and replacement needs in the wholesale and retail trade industry be approximately doubled and those for the service industry be multiplied by ten. Such occupational skills as clerical and related, salesmanship and customer service, cooking, and food service are prevalent in these industry groups. The additional numbers shown as needed in the future and replacement needs listed in the survey for these types of workers should be considered as minimum needs.

Table A and Table B in the Appendix present detailed listings of the suitable jobs and skill requirements. Since many of the jobs involve multiple skills, it is important to study the skill needs along with the job needs in order to relate the two.

EMPLOYER NEEDS

BY OCCUPATIONAL GROUP

Results from the 160 responding firms in the surveyed area indicate that of the current total of 7,742 people working in these companies, 4,575 are employed in positions for which the employer would hire inexperienced youth, assuming the jobs were open.

TABLE I

CURRENT EMPLOYMENT AND ANTICIPATED NEEDS IN JOBS SUITABLE FOR YOUTH, BY OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	CURRENT EMPLOYMENT	ANTICIPATED ADDITIONS 1965-1967	ANTICIPATED ADDITIONS 1967-1970	REPLACEMENT NEEDS FOR NEXT YEAR
Professional, Technical & Managerial	54	36	11	15
Clerical and Related	574	100	102	105
Public Contact Work	241	39	48	44
Service Work	199	24	21	27
Machine Trades	1,014	188	235	200
Crafts	463	116	121	107
Manual Work	2,030	679	796	312
TOTAL	4,575	1,182	1,334	810

Area employers estimate that two years hence, in 1967, their expanding needs will provide 1,182 additional job openings in occupations for which inexperienced youth could qualify; and from 1967 to 1970 the continuing increase in activity is expected to generate an added 1,334 jobs. Thus, expanding business needs are expected to add a total of 2,516 jobs by 1970 in occupations in which youth would be considered. Replacement expectations for next year will provide an additional 810 openings.

It should be noted that of the 4,575 jobs that employers consider suitable for youth, about three-quarters are in what is usually termed the blue-collar jobs--the machine trades, the crafts, and manual work. Of the two-year expansion needs, more than 83 per cent are estimated for the same three groups; and for the 1967-1970 period, better than 86 per cent fall in the same categories. Of the replacements estimated for next year, 76 per cent are anticipated in these groups.

Data in this study are based entirely on surveyed firms. No allowance was made for jobs or skill requirements in firms outside the survey coverage.

One-year replacement requirements reported were not expanded to cover a longer period of time. Caution should be used in projecting long-term replacement needs on the basis of employers' expressed estimates for next year, though some allowance should be made for replacement needs in subsequent years.

BY INDUSTRY GROUP

Manufacturing industries, particularly those in the durable goods segment of the Connersville area economy, offer the most employment opportunities for inexperienced youth. Of the jobs currently occupied by the 7,742 people in the responding firms, 4,575 were considered suitable for youth by the employer. Just under 80 per cent of these youth-oriented jobs were in manufacturing, with durable goods industries accounting for 3,509 openings, and nondurable goods manufacturing making up the remainder of 139.

Nonmanufacturing industry employers reported 927 youth-suitable jobs, with more than half concentrated in wholesale and retail trade establishments.

TABLE II

EMPLOYMENT IN OCCUPATIONS SUITABLE FOR YOUTH,
BY INDUSTRY GROUP

INDUSTRY GROUP	EMPLOYMENT IN JOBS SUITABLE FOR YOUTH			
	CURRENTLY EMPLOYED IN THESE OCCUPATIONS	ADDED NEEDS 1965-67	ADDED NEEDS 1967-70	REPLACEMENT NEEDS 1966
MANUFACTURING				
DURABLE GOODS	3,509	958	1,103	582
NONDURABLE GOODS	139	39	55	16
TOTAL	3,648	997	1,158	598
NONMANUFACTURING				
MINING & CONSTRUCTION	65	17	7	21
COMMUNICATIONS & PUBLIC UTILITIES	74	14	18	12
WHOLESALE & RETAIL TRADE	495	116	98	138
FINANCE, INSURANCE & REAL ESTATE	89	11	17	19
SERVICES	22	3	6	3
GOVERNMENT	182	24	30	19
TOTAL	927	185	176	212
TOTAL--ALL INDUSTRY GROUPS	4,575	1,182	1,334	810

Surveyed manufacturing firms listed a total of 144 occupational titles as suitable for inexperienced youth, while nonmanufacturing firms listed a total of 257 job titles. In the manufacturing companies, occupations suitable for youth involved substantially greater numbers of people, but the openings were restricted to fewer occupational choices than in the nonmanufacturing firms.

Most of the 1965-67 increase in number of jobs suitable for youth will be in manufacturing industries (958 in durable goods and 39 in nondurable goods). An increase of 185 workers is anticipated in the two-year period for nonmanufacturing organizations. Over 60 per cent of this gain is attributed to wholesale and retail trade companies.

A similar pattern exists in the distribution of the 1,334 job increase anticipated for 1967-70 period. Manufacturing industries are expected to absorb 1,158 new workers, with the durable goods group accounting for 1,103, and the nondurable goods group for 55. An increase of 176 workers in nonmanufacturing firms is predicted for the three-year span, with firms engaged in wholesale and retail trade requiring 55 per cent of these jobs.

In addition to the openings created by the expected expansion, replacements needed next year by the responding firms are estimated at 810 people. Of this total, 598 workers will be in manufacturing, and 212 in nonmanufacturing industries. Almost two-thirds of the estimated replacement needs in nonmanufacturing firms are anticipated in the wholesale and retail trade groups.

SKILLS AND KNOWLEDGE REQUIREMENTS

To aid in planning school curriculum, it is necessary to look at skill requirements for jobs in terms of needs for enrollments in separate training courses. Many of the jobs require workers trained in multiple skills; however, these skills must be considered separately when counting the actual number of course enrollments needed.

Employers listed a total of more than 100 different types of skills, knowledge or personal attributes required for qualifying youth in the various suitable entry jobs. By 1967, more than 2,200 total enrollments in various training courses in the listed skills will be needed, and from 1967 to 1970, expansion expectations will require another 2,570 course enrollments in the required skills. Replacement needs next year will involve a total of 1,586 skill requirements.

The skills and knowledge required to prepare youth are the most numerous in jobs associated with the machine trades, crafts and manual work. The two- and five-year expansion needs of employers indicate the greatest needs for additional enrollees in metal-machine operating, machine shop, the use of hand and power tools, blueprint reading, and the use of precision instruments.

More than 900 of the present jobs specified as suitable for youth involve the skill of metal-machine operating; the expansions show that the greatest number of additional training needs will be in the skill of the use of hand and power tools. Though this is the single skill requirement indicated by employers in the most numerous jobs, these same jobs involve various other skills to provide well-rounded youth training in these occupations. Machine shop training will be required for more than 130 additional jobs in two years, and for another 175 which will be added in the succeeding three years; next year's replacement needs involve in excess of 160 jobs.

In the clerical skills, typing was reported most often as a needed skill in a wide variety of occupations. In two years, 45 typing trainees will be needed and another 38 workers will need to be trained by 1970 to handle expansion expectations. Anticipated replacement needs for the next year involve 39 jobs. Other skills involved in the clerical jobs are bookkeeping, stenography, secretarial skills, business arithmetic, business machines operating, cash register operating, and office practice.

Table B in the Appendix lists each skill separately and shows the increased training needs for the skills indicated by employers for those jobs in which vocational or high school training courses were checked as the desired training method.

ADULT EDUCATION NEEDS

No adult education courses are available at present in the area, although some surveyed employers indicated a strong interest in the establishment of such a program. The need for re-training adults to upgrade or update their skills was specifically expressed for the following skills:

- Precision instrument reading
- Blueprint reading
- Mechanical drafting
- Machine shop
- Tool and die making
- Time and motion study
- Cost estimating
- Machine and engineering math (including use of slide rule)
- Basic electricity
- General plant maintenance skills (welding, millwright, plumbing, and machine repair)
- Various office skills

EXISTING TRAINING COURSES

The local high schools offer a limited number of vocational courses in some of the skills required by employers. Many additional skills were listed as required by industry for entry jobs.

The curriculum of the Fayette County School Corporation includes training in machine shop, mechanical drawing, auto mechanics, electricity, agriculture, business education, home economics and general shop (including some woodworking).

Brookville High School offers courses in business education, agriculture, industrial arts (including general shop, machine shop and mechanical drawing), and home economics.

Liberty High School offers business education, agriculture, home economics, and industrial arts (including general shop, drafting and three years of shop which consists of 1 year of auto mechanics, 1 year of metal shop and 1 year of woodworking).

There are no training courses in progress under the Manpower Development and Training Act in the area.

RECOMMENDED TRAINING METHODS

High school or vocational school courses were shown by employers as the recommended training method for over 3,300 of the jobs listed as suitable for inexperienced youth. A combination of specific institutional courses and on-the-job training was recommended for slightly over one-half of the total 4,575 jobs. About 600 were shown as requiring on-the-job training only and another 595 require no formal training.

TABLE III

DISTRIBUTION OF EMPLOYER RECOMMENDATIONS FOR TRAINING OF YOUTH

	NUMBER		PER CENT	
Total Jobs Suitable for Youth		4,575		100%
High School or Vocational Courses		3,348		73%
(combined with on-the-job training)	2,500		54%	
On-the-job Training only		632		14%
No Formal Training needed		595		13%

Two hundred and seventy-four separate occupational listings were included in the 3,348 jobs for which employers recommended high school or vocational courses. For 2,500 of the jobs for which employers recommended this type of training, need for additional on-the-job training was expressed. On-the-job training was indicated as the sole training need for only 632 jobs, but altogether, 3,132 jobs for 231 separate occupational titles were reported as requiring on-the-job training as a part, at least, of the job preparation method.

In responses involving 595 workers and 47 separate listings, the employers did not indicate that either high school or vocational courses or on-the-job training was required for the occupations. Among these occupations were stock boys, waitresses, janitors and custodians, and general laborers and helpers in the manufacturing and construction industries.

Table A in the Appendix lists numbers and kinds of occupations suitable for youth, and the skills needed to qualify for the jobs, along with the training methods recommended by employers.

APPENDIX

METHODOLOGY

In October 1965, survey forms were mailed to 251 firms covered by the Indiana Employment Security Act 1/ in Fayette, Franklin and Union Counties and the larger firms in Cambridge City (Wayne County), plus two large noncovered firms.

Employers were asked to list the jobs for which they would hire inexperienced youth who had recently completed high school. They were also asked to indicate the specific skills and knowledge required by youth for entry into these jobs. In order to estimate the extent of the needs in terms of kinds and numbers of courses to be taught, information on current and anticipated employment by occupation two and five years hence was requested. In addition, replacement needs by occupation were estimated for the coming year. Replacement need consists of jobs left vacant by workers who retire, die, leave the occupation, or move out of the area.

The employing firms were asked to express their opinion as to how the necessary skills and knowledge could best be acquired--whether through high school courses, or through their own on-the-job training of the youth. They were also asked to indicate those jobs that they listed which required no formal training for entry.

The survey results were not expanded to allow for nonrespondents; some nonresponding firms undoubtedly would have had additional suitable jobs to report, as well as some of the firms not included in the survey coverage. Replacement needs were not projected to two and five year totals, one-year expectations alone were reported.

1/ Firms subject to the Act include those which employ four or more workers in any twenty weeks of a year. Excluded from coverage are agriculture, railroads, government and domestic help and casual labor. In general, about three-fourths of nonfarm employment is covered, including about 96% of manufacturing but a smaller percentage of nonmanufacturing.

SURVEY RESPONSE

Of the 251 firms contacted in the survey, 160 responded, representing nearly 64 per cent of the total. These responding firms employ 7,742 workers, comprising over 80 per cent of the total 9,639 employed in all the surveyed establishments. No replies were received from 91 firms with the employment of approximately 1,900 persons.

TABLE IV

RESPONSE AND EMPLOYMENT IN THE SURVEYED FIRMS, BY COUNTY

	TOTAL SURVEYED		RESPONDING FIRMS		PER CENT RESPONSE	
County	Number of Firms	Employment	Number of Firms	Employment	Firms	Employment
Fayette	153	7,142	108	6,078	70.6	85.1
Franklin	54	1,034	28	534	51.9	51.6
Union	27	388	12	272	44.4	70.1
Wayne*	17	1,075	12	858	70.6	79.8
TOTAL	251	9,639	160	7,742	63.7	80.3

* Cambridge City only.

By county, the best response was from Fayette County where 71 per cent of the 153 companies answered. These 108 answering firms in Fayette County represent just over 85 per cent of the employment in 153 establishments in the county.

In Wayne County, where 17 of the larger businesses in Cambridge City were contacted, 12 (71 per cent) responded; this represents almost 80 per cent of the employment in the contacted firms.

INDUSTRY RESPONSE

Firms in manufacturing industries constitute about 18 per cent of the total number of covered establishments in the surveyed area and are responsible for nearly three-quarters of the total covered employment. In both the manufacturing and the non-manufacturing segments surveyed, reports were received from about two-thirds of the firms; employment in responding manufacturing firms constituted about 82 per cent of total manufacturing employment while 75 per cent of the covered nonmanufacturing employment was represented in the responses.

TABLE V

RESPONSE AND EMPLOYMENT IN SURVEYED FIRMS, BY INDUSTRY GROUP

	TOTAL SURVEYED		RESPONDING FIRMS		PER CENT RESPONSE	
	Number of Firms	Employment	Number of Firms	Employment	Firms	Employment
MANUFACTURING						
Durable Goods	27	6,106	22	5,339	81.5	87.4
Nondurable Goods	17	849	6	388	35.3	45.7
TOTAL	44	6,955	28	5,727	63.6	82.3
NONMANUFACTURING						
Mining & Construction	18	144	11	103	61.1	71.5
Trans., Comm., & Pub. Utilities	8	191	8	191	100.0	100.0
Wholesale & Retail Trade	126	1,265	74	811	58.7	64.1
Fin., Ins., & Real Estate	18	197	15	174	83.3	88.3
Services	27	265	14	114	52.0	43.0
Government	10	622	10	622	100.0	100.0
TOTAL	207	2,684	132	2,015	63.8	75.1
TOTAL--ALL INDUSTRY GROUPS	251	9,639	160	7,742	63.7	80.3

Three major manufacturing industry groups--fabricated metal products, nonelectrical machinery and electrical machinery employ over 5,000 of the total of 6,995 employed in the manufacturing firms surveyed; these three industry groups expect continued growth. The percentage of response in the durable goods industries was nearly 82 per cent of the firms and over 87 per cent of the employment; in nondurable goods, experience was less spectacular.

About one-half of the covered firms in the area are engaged in wholesale and retail trade. These establishments, though the most numerous, are responsible for only about 13 per cent of total surveyed employment. Responses were received from more than 58 per cent of the firms in this group, representing about 64 per cent of the total employed in the wholesale and retail trade firms surveyed. All of the ten surveyed government agencies and all of the eight firms in the transportation-communications-public utilities group responded.

Pub Date - Apr66 47p.

*OCCUPATIONAL SURVEYS; *EMPLOYMENT OPPORTUNITIES; LABOR FORCE; EMPLOYER ATTITUDES; EMPLOYMENT STATISTICS; *EMPLOYMENT QUALIFICATIONS; EMPLOYMENT TRENDS; *HIGH SCHOOL GRADUATES; EDUCATIONAL NEEDS; OCCUPATIONAL INFORMATION; JOB SKILLS; OCCUPATIONAL CLUSTERS; *VOCATIONAL EDUCATION; ON THE JOB TRAINING; YOUTH EMPLOYMENT LAYFAYETTE, INDIANA

A survey determined jobs in the area which were suitable for inexperienced high school graduates and identified the skills and knowledge required by employers to qualify youth for entry into these jobs. The results were to be used by school officials in evaluating current courses and in planning future vocational training facilities. More than one-third of the estimated 33,925 workers employed in nonfarm industries in the Layfayette area were working on jobs that inexperienced high school graduates could fill, provided the jobs were open and the necessary training was given. Growth was predicted in most of these occupations, and an additional 3,319 openings would be available each year to replace workers who retire, die, or leave the occupation. Vocational training skills associated with clerical and related jobs were cited most frequently as a requirement for anticipated job openings. The second most frequently cited were those closely related to the machine trades and crafts occupations with mechanical and carpentry skills predominating. Assessment of the proficiency level of desired skills and clarification of employer's terminology is needed to assure maximum usefulness of the data in setting up certain specific training courses. Detailed tables of youth-suitable jobs and skills requirements are included in the appendix. (HC)

PREFACE

The Lafayette Vocational Training Survey was initiated by Mr. Karl Leffler, Director of Vocational and Adult Education in the Lafayette School Corporation, and was conducted by the Lafayette local office and the Research and Statistics Section of the Indiana Employment Security Division. The purpose was to determine what jobs in the area would be suitable for inexperienced high school graduates, and to identify the skills and knowledge required by employers to qualify youth for entry in these jobs. Employers were asked to recommend new and additional training courses which would be most valuable in preparing youth for jobs in their firms.

The results of this survey of employers' needs in Tippecanoe County will aid school officials in evaluating their present courses, and in planning future vocational training facilities that will be most practical and useful. Both employers and educators have become more aware of the need for closer cooperation and the necessity for setting up a regular exchange of information between hiring officials in industry and training officials in schools. This awareness of interdependence and the need for planning is of great value to an entire community.

The tendency in most secondary schools has been to emphasize academic programs geared to provide students with the necessary background to meet college entrance requirements. Although this type of educational approach is necessary, it may tend to neglect the needs of the students who must compete in the labor market immediately after high school graduation. Because the number of youths entering the labor force has increased and the rate of teenage unemployment remains high in relation to the total unemployment rate, more attention is being focused on vocational training. Schools must be allowed adequate space, up-to-date facilities and equipment, and sufficient teaching staff to provide non-college bound youths with well-rounded training and marketable skills.

Under the provisions of the Vocational Education Act of 1963, the identification and reporting of area training needs to the Vocational Education Department is the responsibility of the Indiana Employment Security Division. The following study was made to comply with this responsibility.

SUMMARY

More than one third of the people currently employed in nonfarm industries in the Lafayette area are working on jobs that inexperienced high school graduates could fill, provided the jobs were open and the necessary training given. Growth was predicted in most of the occupations for which youth could be trained. Many additional openings will be available each year to qualified young people to replace those workers who retire, die, leave the occupation or withdraw from the area's labor market.

Surveyed employers estimate that during the next five-year period, job opportunities for youth will grow at the average annual rate of seven per cent. By 1967, a total of 2,032 new jobs will be added and during the remaining three-year period, 2,143 additions will be made. Replacement needs* for next year numbering 3,319, a rate of 27 per cent, were reported by employers.

Vocational facilities designed to meet employers' increasing needs in a wide variety of skills is indicated. Vocational training in skills associated with clerical and related jobs, with emphasis on typing training, was cited most frequently as a requirement for anticipated job openings. Skills closely related to the machine trades and crafts occupations were reported as having the second largest number of increased needs for training, with mechanical training and carpentry skills predominating.

Recommendations by employers for new or additional training to be offered in an expanded high school program covered a wide variety of skills. Assessment of the proficiency level in the desired skills is needed and clarification of employers' terminology in some instances would be required to assure maximum usefulness of this data by the school system in setting up certain specific training courses.

Table A and Table B in the Appendix present detailed listings of the suitable jobs and skill requirements. Since many of the jobs involve multiple skills, it is important to study the skill needs along with job needs in order to relate the two.

* Replacement needs represent jobs to be filled because the previous employees are no longer available for work in the occupation. One of the reasons why replacement needs are high is that many jobs which are suitable for youth require little or no specific training for entry and are filled by students on a part-time or temporary basis. When their schooling is completed, these youth leave such jobs for others more closely related to their new qualifications. Another reason is the many jobs suitable for youth at Purdue University and the fact that many are filled by students and their working wives during their periods of enrollment. Such jobs are included in replacement needs; however, influx of new enrollees provides a continual source of supply from outside the Lafayette area.

Employers were asked to exclude workers going from one firm to another in the same occupation, but this is difficult to do unless exit interviews are conducted and permanent records are kept. We feel that replacement needs probably include some turnover in the occupations and are over-stated because of this.

To have disregarded replacement needs altogether in this study would have been to understate needs; we chose to release the one-year figures, with explanation of their content and a caution about their use in estimating actual numbers of future training needs for youth.

OCCUPATIONS SUITABLE FOR YOUTH

The results of the survey of Lafayette employers show that there is a substantial number of jobs suitable for qualified youth in the area. Growth in most of these occupations is predicted over the next two and five-year periods.

There are an estimated 12,302 jobs in the area which are suitable for inexperienced high school graduates. This constitutes more than one-third of the estimated total of 33,925 employed in nonagricultural jobs in October 1965, the survey period. In the next two years, employers anticipate expansion to 14,334 employed in these occupations and a further increase to nearly 16,500 is expected by 1970. Growth will approximate 4,200 over the next five-year period amounting to 840 new jobs per year.

Replacement needs reported by surveyed employers total 3,319 for a year. Replacements are workers who leave the labor force for reasons such as retirement, disability, death, or entry into the Armed Forces, or those who leave the occupation or move from the area. Several factors (which are related in the summary) may have a bearing on this seemingly higher-than-normal replacement rate.

Although considerable caution is advised in using replacement figures to estimate actual numbers of future needs, the total replacements as reported do represent the strength of training needs in certain specific occupational categories.

TABLE I

ESTIMATED CURRENT EMPLOYMENT AND ANTICIPATED NEEDS IN OCCUPATIONS SUITABLE FOR YOUTH, BY OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	CURRENT EMPLOYMENT	ANTICIPATED ADDITIONS 1965-1967	ANTICIPATED ADDITIONS 1967-1970	REPLACEMENT NEEDS FOR NEXT YEAR
Professional, Technical & Managerial Work	264	53	92	67
Clerical & Related Work	3,033	330	562	1,076
Public Contact Work	1,260	91	66	239
Service Work	1,514	109	181	605
Skilled Work	1,513	334	263	252
Manual Work	4,718	1,115	979	1,080
Total	12,302	2,032	2,143	3,319

The largest number of workers currently employed in occupations listed as suitable for youth appeared in the semiskilled and unskilled jobs in manual work; more than 38 per cent of the estimated total of 12,302 workers are employed in this group. This group also reported the largest number of anticipated needs for expansion and replacements. Of the jobs listed in the manual work category, the largest numbers are currently employed as production workers, assemblers and janitors. More than 41 per cent of the jobs in this group are in these occupations, while approximately 81 per cent of the two-year anticipated additions for this group will be in these three occupations also.

TABLE II

GROWTH AND REPLACEMENT RATES IN OCCUPATIONS SUITABLE FOR YOUTH, BY OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	CURRENT EMPLOYMENT	RATE OF GROWTH ANTICIPATED ADDITIONS 1965-1967	RATE OF GROWTH ANTICIPATED ADDITIONS 1967-1970	RATE OF REPLACEMENTS NEXT YEAR
Professional, Technical & Managerial Work	264	20%	29%	25%
Clerical & Related Work	3,033	11%	17%	35%
Public Contact Work	1,260	7%	5%	19%
Service Work	1,514	7%	11%	40%
Skilled Work	1,513	22%	14%	17%
Manual Work	4,718	24%	17%	23%
Total	12,302	17%	15%	27%

Nearly one fourth of the total currently employed in youth-suitable jobs are in the clerical and related group with the second largest number of total anticipated needs here also. Of the 3,033 workers currently employed in jobs in this category, nearly half are working as typists, clerk-typists and general office clerks, and almost one third of the new jobs in this category will be in these three occupations. Further increases are anticipated in the succeeding three years, and by 1970, almost 40 per cent of the new clerical jobs will be in these three occupations. Replacements will be needed at the rate of 35 per cent in all clerical occupations as a group; the one-year replacement rate for these three occupations is slightly less than 34 per cent.

Growth in secretarial positions will be less spectacular; during the coming two-year period, there will be 6 per cent more jobs and during the succeeding three-year period there will be an increase of 20 per cent. Replacements in

this occupation are very high; almost half of the total number now working will have to be replaced next year. The large numbers of women who have a temporary attachment to the labor force or to the area probably cause this high rate of leaving. This may be considered as a factor influencing replacement needs in other clerical occupations as well.

Growth in the skilled occupations is anticipated at the rate of 22 per cent during the next two-year period, and 14 per cent for the succeeding three-year period. The annual replacement rate in these occupations is the smallest of any of the groups; only 17 per cent of the total currently employed will need to be replaced in the coming year. In the next two-year period, more than half of the new jobs in the skilled group will be in the crafts segment and the following three-year period will show an increase which will amount to around 30 per cent of the total new jobs in this group. More than 56 per cent of the annual skilled replacements will be in the crafts. Less growth and fewer replacement needs are predicted for the machine trades.

Although growth rate in the service jobs for youth will be less than any other group, the replacement rate is the highest at 40 per cent of those currently employed. Many young people accept service jobs on a part-time or temporary basis and move on to a different occupation upon completion of training. In these jobs, the large number of women who marry and leave the labor force also affects the replacement rate.

Of the total number of occupations listed by the surveyed firms as suitable for youth, 43 per cent are in manufacturing industries. These firms predicted a greater growth rate than nonmanufacturing establishments over the next two-year and five-year periods; by 1967, more than 45 per cent of the jobs for youth will be in manufacturing firms. More than two thirds of the yearly replacements will be needed in the nonmanufacturing jobs for youth.

Table A in the Appendix contains a detailed listing of the separate occupations indicated by employers as suitable for youth, with a tabulation of anticipated available openings.

Training methods recommended by employers in these occupations varied from one employer to another in the same occupation and from one occupation to another according to individual hiring requirements. Employers recommended vocational or general high school training in more than half of the occupations, involving two thirds of the workers; three quarters of the listed occupations were checked as requiring some type of on-the-job training, involving approximately 85 per cent of the workers. In many of the jobs, employers felt that a combination of both high school and additional on-the-job training was required; in 44 per cent of the occupations involving 56 per cent of the workers this combination was indicated.

Totaled in the table below are the number of occupations and current employment in these occupations listed according to the preparation methods recommended by employers.

TABLE III

TRAINING METHODS RECOMMENDED BY EMPLOYERS IN OCCUPATIONS SUITABLE FOR YOUTH, BY OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	TOTAL NUMBER LISTED	HIGH SCHOOL TRAINING	ON-THE-JOB TRAINING	COMBINATION H.S. & O.J.T.
PROFESSIONAL, TECHNICAL AND MANAGERIAL				
Number of Occupations	15	11	13	10
Current Employment	264	248	229	221
CLERICAL AND RELATED				
Number of Occupations	102	76	72	52
Current Employment	3,033	2,615	2,459	2,073

Number of Occupations	69	46	54	35
Current Employment	1,513	1,232	1,389	1,136
MANUAL WORK				
Number of Occupations	85	31	59	27
Current Employment	4,718	2,770	3,759	2,044
TOTAL				
Occupations Listed	355	200	272	156
Current Employment	12,302	8,265	10,483	6,850

In eleven of the fifteen separate occupations in the professional, technical and managerial category, employers indicated high school training was needed; in all except one of these, some kind of on-the-job training was also indicated. In thirteen of the occupations, on-the-job training was indicated as a requirement, and in ten of these, a combination of both high school training and additional on-the-job training was indicated.

In the service occupations, entrants in 45 of the 49 occupations listed as suitable for youth could receive training on the job, while only twelve required high school training for entry. In twelve of the occupations, high school training and additional training on the job were recommended.

In the manual work group involving semiskilled and unskilled job openings, only 31 of the 85 occupations listed required high school training, and only 27 occupations required a combination of high school training and additional on-the-job training. For 59 of the 85 occupations in this category on-the-job training was indicated; for some of these high school training was also desirable.

Table A in the Appendix lists the separate occupations as reported by the surveyed employers with the type of training considered desirable in each. The skills for which employers considered high school or vocational training as necessary preparation are tabulated by the number of additions and replacements needed in the next two and five-year periods to fill anticipated openings.

SKILLS AND KNOWLEDGE REQUIREMENTS

As a guide to area educators in setting up school curriculum, skills and knowledge requirements for the jobs available to youth have been tabulated in detail in the Appendix, Table B, and summarized by broad occupational classifications in the table below. Many of the jobs require workers trained in multiple skills; however, these skills must be considered separately when estimating future enrollments needed.

TABLE IV

ENROLLMENTS REQUIRED TO FILL ANTICIPATED SKILL REQUIREMENTS, BY OCCUPATIONAL GROUP

	TRAINING NEEDS IN THE SKILLS REQUIRED		
	FOR EXPANSION		FOR REPLACEMENTS
OCCUPATIONAL GROUPING	1965-1967	1967-1970	NEXT YEAR
Professional, Technical & Managerial Skills	160	311	238
Clerical and Related Skills	587	1,041	2,263
Public Contact Skills	42	10	152
Service Skills	34	72	48
Agricultural Skills and Knowledge	12	6	18
Machine Trades and Crafts Skills	517	478	730
Manual Work Skills	8	9	10
High School Training (General, Commercial & Vocational)	305	437	521
Total	1,665	2,364	3,980

In relating the skills and knowledge to the associated jobs, it should be noted that employers often expressed different opinions about what qualities are important in the same types of jobs. Others may have noted only the principal qualifying skills, while taking for granted that high school graduates in general would possess certain skills in the necessary degree. In this survey, skills were identified, but no attempt was made to evaluate proficiency or level of skill needed.

Employers listed nearly 100 separate skills, knowledge, aptitudes or personal traits needed to perform various jobs considered suitable for youth. Around 80 of these were also associated with jobs for which high school or vocational training was considered important.

By 1967, 1,665 total enrollments in the various training courses will be needed to handle expansion expectations and from 1967 to 1970, 2,364 additional courses will be needed. To replace workers who leave jobs vacant, an estimated total of 3,980 skill requirements will be needed next year.

The most numerous expansion and replacement needs appeared in skills associated with clerical and related jobs. Of the 587 additions expected in these skills by 1967, 60 per cent were in typing, office procedures and business arithmetic, 64 per cent of the additions anticipated from expansion requirements over the succeeding three-year period and 70 per cent of one-year replacement needs were in these categories also. Total five-year expansion needs for typing will amount to 483 training courses and replacement needs for next year will require 730 courses.

Next most numerous were the skill requirements associated with the skilled machine trades and crafts grouping, with the needs for mechanical training and carpentry predominating.

Completion of high school training (general, commercial or vocational courses) was listed as sufficient qualification for entry workers in many of the jobs. Some employers also specified certain skills to be obtained in this training.

EXISTING TRAINING COURSES

At present, the Tippecanoe County schools offer very limited vocational education facilities. The following 1964-65 enrollment information was supplied by the State Vocational Education Department:

Name of School Corporation	Training Program (Apprenticeship)	Enrollment Day	Enrollment Evening	Total
Lafayette School Corporation	Carpentry	--	16	
	Electricity	--	24	
	Plumbing	--	10	
	Diversified Cooperative Ed.	48		
				98
West Lafayette Community School Corporation	Diversified Cooperative Ed.	8		8
Tippecanoe County School Corporation	Vocational Agriculture	147	--	
	Horticulture	--	24	
	Farm Management	--	12	
	Productive Agriculture	--	50	
				233
	Total in County			339

Courses in welding, machine shop and vocational homemaking are available. In addition, the establishment of local vocational training facilities in the office occupations has been approved.

There are no training courses in progress under the Manpower Development and Training Act in the area.

Most of the surveyed employers provide some form of company training, either as the entire amount of the qualifying training, or as additional on-the-job apprenticeship or orientation training to entry workers. The majority of these employers indicated that their programs were adequate to fill their anticipated needs provided a sufficient supply of qualified applicants is available. However, for certain jobs, applicants must have obtained specific background skills in high school in order to qualify.

EMPLOYER TRAINING RECOMMENDATIONS

Although employers in general felt their existing company training programs were adequate to fill the needs for which they were designed, some employers indicated a definite lack in certain occupations. Inadequate company training provisions were reported in the construction crafts occupations; additional company training could also be provided for mechanical repairmen, stock clerks, clerical workers (particularly typists), cashiers, salesmen (retail and wholesale), meat cutters, cooks and food service workers, laboratory assistants and maintenance workers.

Employers listed under the appropriate training method those occupations or skills for which new or additional training is most needed to prepare workers for jobs in their firms.

Following are the skills and occupations most frequently shown:

MANUFACTURING FIRMS

COMPANY TRAINING (INCLUDING APPRENTICESHIP)

Automatic Screw Machine Operator
Maintenance Work
Mechanic
Mixer Operator
Plant Batchman
Skilled Trades
Tool and Die Maker
Tool Training

HIGH SCHOOL TRAINING

Blueprint Reading
Electrician
Machine Shop
Mechanics
Ready-Mix Mfg.
Shop Math
Toolmaking
Woodworking
Clerical Skills
Large Vehicle Oper.
Machinist
Oper. of Weight Scales
Sheet Metal Shop
Tool Care
Trigonometry

NONMANUFACTURING FIRMS

COMPANY TRAINING (INCLUDING APPRENTICESHIP)

Bricklayer
Carpenter
Cement Finisher
Checker
Cooks, Bakers, General Restaurant Workers
Crafts and Machine Trades Apprentices
Forklift Operator
Ironworker
Lineman
Mechanics and Parts Clerks (Auto, Diesel and Farm Equipment)
Office Clerks
Retail Grocery Occupations
Salesman

HIGH SCHOOL TRAINING

Arithmetic
Carpentry
Engineering
Lab Assistant
Mathematics
Mechanics
Shop
Vocabulary
Blueprint Reading
English
Food Service and preparation
Mechanical Training
Penmanship
Spelling
Welding
Occupations in Crafts and Trades
Retail Grocery Occupations

Information useful in setting up an expanded high school program was sought from employers in an effort to find out what courses would be most valuable in preparing youth for jobs in their firms. The following tabulation of widely diversified training recommendations is the result:

Accounting and Math	Agriculture	Architectural Drafting
Arithmetic	Auto Mechanics	Bacteriology
Baking	Biology	Blueprint Reading
Building Trades	Business Admin.	Business Law
Business Management	Care of Tools and Machines	Carpentry
Cashier	Composition	Cooking
Cost Estimating	Diesel Engine Repair	Economics
Electricity	Electronics	English
Farm Equipment Repair	Filing	Finance
Food Handling	Gasoline Engine Repair	Health and Sanitation
Home Economics (Boys)	Key-Punch Operating	Letter Writing
Machine Shop	Maintenance	Mathematics
Meat Cutting	Mechanical Drawing	Office Practice
Penmanship	Pipefitting	Produce and Stock Clerk
Public Relations	Reading	Ready-Mix Operator
Sales	Science	Service Writing
Sewing	Simple Layout	Sheet Metal Work
Shipping and Receiving	Shop Math	Shop Craft--Mechanical
Shorthand-Typing	Spelling	Tool Making
Typing	Use of Hand and Machine Tools	Use of Precision Instruments
Use of Slide Rule	Waitress	Welding

Some area employers also suggested the possibility of including high school courses to improve the personal attributes of the individual young workers. Among those mentioned were good grooming and personal development.

Surveyed firms were asked to list any part-time jobs in their firms for which they would consider using students in a cooperative work-school program. More than 38 per cent of the responding employers listed jobs adaptable to this type of program.

Manufacturing firms listed ten different kinds of occupations suitable for students in a cooperative program. These were listed in eight different industries and included the occupations of baker helper, laborer (18 years old or over), key-punch operator, machine operator helper, machinist, molder helper, technician, office clerk, apprentice printer and draftsman.

More than forty nonmanufacturing employers listed jobs suitable for youth in a cooperative program. Nearly 88 per cent of these were engaged in wholesale and retail trade, offering the suitable occupations of sales clerks and cashiers, office clerks, stock clerks, order and mail clerks, laborers and dock and warehouse workers, and various types of restaurant work. In other nonmanufacturing industries, such jobs as drafting, apprentice pharmacist, mechanic helper and car washers were mentioned as adaptable to a cooperative program.

APPENDIX

METHODOLOGY

In October 1965, survey forms were mailed to a sample of firms selected from those covered by the Indiana Employment Security Act 1/ in Tippecanoe County, plus the largest noncovered firms in the area.

Employers were asked to list the jobs for which they would hire inexperienced youth who had recently completed high school. They were also asked to indicate the specific skills and knowledge required by youth for entry into these jobs. In order to estimate the extent of the needs in terms of kinds and numbers of courses to be offered, information on current and anticipated employment by occupation two and five years hence was requested. In addition, replacement needs by occupation were estimated for the coming year. Replacement need consists of jobs left vacant by workers who retire, die, or leave the occupation, or move out of the area.

The employing firms were asked to express their opinion as to how the necessary skills and knowledge could best be acquired--whether through high school courses or through their own on-the-job training of youth.

The survey results were expanded to area totals by applying industry and size group inflation factors. The table below lists total estimated Tippecanoe County employment by industry grouping as of October 1965.

TABLE V

EMPLOYMENT, BY INDUSTRY

TIPPECANOE COUNTY EMPLOYMENT, BY INDUSTRY
OCTOBER 1965

TOTAL EMPLOYED	37,765
Employed in Nonfarm Industries	33,975
Manufacturing	9,310
Durable Goods	7,435
Nondurable Goods	1,875
Nonmanufacturing	24,665
Mining	50
Construction	1,180
Transportation, Communication and Public Utilities	1,365
Wholesale and Retail Trade	6,715
Finance, Insurance and Real Estate	1,770
Service Industries	4,500
Government	9,000
All Other Nonmanufacturing	85
All Other Nonagriculture	2,780
Agriculture	1,010

Total employment in the Lafayette area was estimated at 37,765 in October 1965. Of this figure, 65 per cent were employed in nonmanufacturing and 25 per cent in manufacturing industries, while nearly 3 per cent of the total were employed in agriculture.

1/ Firms subject to the Act include those which employ four or more workers in any twenty weeks of a year. Excluded from coverage are agriculture, railroads, government and domestic help and casual labor. In general, about three fourths of nonfarm employment is covered, including about 96% of manufacturing but a smaller percentage of nonmanufacturing.

*OCCUPATIONAL SURVEYS; *EMPLOYMENT OPPORTUNITIES; LABOR MARKET; LABOR FORCE; EMPLOYMENT LEVEL; *OCCUPATIONAL CLUSTERS; EMPLOYMENT SERVICES; *METROPOLITAN AREAS
INDIANA

The objectives of this job vacancy survey were to obtain information about (1) number, location, and kinds of unskilled jobs, (2) the training needs to be initiated or accelerated, (3) types of unfilled jobs in an area as compared to types of job orders in the Indiana State Employment Service, and (4) job vacancies that could be filled by unemployed workers registered in local unemployment offices. Practically the same types of job vacancies were found in each of the seven largest labor markets surveyed. More than one third of the vacancies in 734 firms were for professional, technical, skilled, or craft occupations. About one fourth of the vacancies existed in clerical and semi-skilled occupations requiring some degree of training. Sales and service jobs constituted about 17 percent of the nearly 4,700 job vacancies, and more than 60 percent were considered hard to fill. Only about 3 percent of the job vacancies in the survey, but not listed in local office order files, could be filled by applicants currently registered for work. Vacancies were reported for practically all of the occupations for which Manpower Development and Training Act training was in progress. Additional welding courses were added after almost 100 vacancies for welders were reported. Only about 4 percent of the employers asked to return survey forms failed to do so. An individual report is included for each of the seven major areas surveyed. (MM)

INTRODUCTION

Job vacancy surveys were conducted in September and October 1964 in seven areas: Evansville, Ft. Wayne, Gary-Hammond-East Chicago, Indianapolis, Muncie, South Bend and Terre Haute.

The Indiana surveys followed closely, but not exactly, the pattern of a series of Federally-sponsored surveys in other selected areas across the country and were undertaken for the following specific purposes:

1. To obtain information about the number, location and kinds of unfilled jobs.

2. To determine the occupations for which there is a shortage of qualified workers so that training for these can be initiated or accelerated.

3. To determine whether or not the types of job orders in local offices of the Indiana State Employment Service are representative of the types of jobs which are unfilled in an area.

4. To find out whether or not the job vacancies existing in industry could be filled by the unemployed workers registered in local employment offices.

SUMMARY OF FINDINGS

More than one third of the job vacancies found in 734 firms in the seven largest labor market areas in Indiana were for professional, technical, skilled or craft occupations. Almost 700 vacancies were reported for registered nurses, graduate engineers, tool and die makers, machinists and precision machine operators.

About one fourth of the job vacancies existed in clerical and semiskilled occupations for which some degree of training is required.

Practically the same types of job vacancies were found in each of the seven areas.

In all, nearly 4,700 job vacancies were reported by employers in the survey.

Ninety per cent of the job vacancies in professional, managerial and official positions reported by employers in the survey were designated by the employers as hard to fill, and more than 80 per cent of the semiprofessional and skilled jobs were shown as hard to fill.

Nearly one half of the job vacancies in clerical and semiskilled jobs were reported by employers as hard to fill.

Vacancies were reported for practically all of the occupations for which training under the provisions of the Manpower Development and Training Act is being given.

Sales and service jobs constituted about 17 per cent of all job vacancies. More than two thirds were considered hard to fill. In all, nearly 500 service jobs and more than 300 sales jobs were listed. Waitresses, countergirls, and porters predominated in the service occupations, sales clerks for retail stores constituted most of the sales jobs. Large numbers of openings for these jobs are always on file in local employment offices, but shortages of applicants to fill them are not always attributable to lack of training. Often these jobs are in small firms, not centrally located, not offering wages or benefits comparable to those in larger firms and other types of industry. Frequently, rigid experience requirements are given and personality factors considered. Study of the recruitment problems in these fields of work might prove helpful.

Other occupations appeared to justify establishment of training programs or extension of existing ones.

The kinds of job openings filed by employers in local employment offices corresponded closely to the kinds of openings reported in the job vacancy survey although the numbers by occupation differed.

In almost all cases, the job vacancies reported by employers as hard to fill were for the same types of occupations which local offices have difficulty filling from their files of unemployed worker registrations. Sufficient qualified applicants were not available either through the employment offices or through other sources utilized by employers. Only about three per cent of the job vacancies listed by employers in the survey but not listed in local office order files could be filled by applicants currently registered for work.

Listed below are the occupations in which most job vacancies were reported and the areas in which the vacancies were found:

Occupations	Number of Vacancies	Areas Reporting Vacancies
Professional		
Engineers (Mechanical, Electrical, Industrial and Civil)	186	Indianapolis, South Bend, Gary-Hammond-East Chicago, Terre Haute, Ft. Wayne, Muncie, Evansville
Nurses (Staff, General, Public Health, Psychiatric, and Nurse Supervisors and Instructors)	195	Indianapolis, South Bend, Gary-Hammond-East Chicago, Terre Haute, Ft. Wayne, Evansville

Laborers (Iron and Steel)	442	Gary-Hammond-East Chicago, Ft. Wayne
Laborers (Electrical Equipment)	150	Indianapolis, South Bend, Ft. Wayne, Evansville

EMPLOYER JOB VACANCY SURVEY

Job vacancy surveys which were conducted during September and October in seven labor market areas of the State revealed 4,674 vacant jobs in 734 firms. A total of 2,634 firms responded to survey questionnaires in the Evansville, Ft. Wayne, Gary-Hammond-East Chicago, Indianapolis, Muncie, South Bend and Terre Haute areas. About 812,000 people were employed in nonagricultural jobs in these areas during the survey period; about 25,000 people were unemployed.

Employment in the responding firms totaled 441,270 constituting slightly more than one half of nonagricultural employment in the seven areas. Only 4 per cent of the firms asked to return survey forms failed to do so. Not all firms were asked to participate in the survey and, therefore, not all vacancies were obtained; however, coverage was broad enough to secure information from almost all firms employing 100 or more, as well as from many smaller ones.

The distribution of the number of job vacancies by industry paralleled the distribution of employment by industry in the seven areas. Fifty-six per cent of the vacancies were in nonmanufacturing firms - the largest numbers in trade and government (primarily hospitals). Seventy-nine per cent of the job vacancies in manufacturing industries were reported by primary metals, fabricated metals, transportation equipment, and electrical and nonelectrical machinery firms.

Slightly more than one third of the job vacancies were in professional, technical and skilled or craft occupations. About one fourth were in clerical and semiskilled occupations for which some degree of training is required. Twenty per cent were in unskilled occupations, primarily for laborers in the Gary-Hammond-East Chicago area where the steel mills were recruiting laborers and in Ft. Wayne where the electrical machinery industry was building its work force seasonally. About 17 per cent were in sales and service occupations.

JOB VACANCIES REPORTED BY SURVEYED EMPLOYERS, BY OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	NUMBER OF VACANCIES	PER CENT OF VACANCIES	NUMBER HARD TO FILL	PER CENT HARD TO FILL
TOTAL	4,674	100.0	2,817	60.3

SEMISKILLED	629	13.5	309	49.1
UNSKILLED	962	20.6	250	26.0

EMPLOYER JOB VACANCY SURVEY - continued

More than 60 per cent of the job vacancies were reported by employers as hard to fill; 68 per cent had been unfilled one week or more. Those occupations involving the highest skills and longest training periods were those reported most often as hard to fill. Professional, managerial and official positions were described as hard to fill in 90 per cent of the listings; more than 80 per cent of the semiprofessional and skilled jobs were reported as hard to fill. Unskilled jobs were least often shown in this category; about one fourth of these jobs were described as hard to fill.

More than one third of the job vacancies in skilled occupations were for machinists, tool and die makers and precision machine operators. In the professional group, more than one half of the vacancies were for registered nurses and graduate engineers. Almost 700 vacancies were reported for these five occupations.

Vacancies were reported for practically all of the occupations for which training under the provisions of the Manpower Development and Training Act is in progress. Although several training courses have been completed for welders, almost 100 vacancies were reported for this occupation. Additional welding courses are now in progress. Licensed practical nurses, nurse aides, office clerks, stenographers, secretaries, draftsmen, typists and dictaphone operators were among those reported for which training is currently being conducted.

The survey period in each area covered one month to allow time for collection of the desired information; employers listed current job vacancies at varying points in time during this period, depending on the date on which the form was completed. Vacancies were defined as job openings for which the employer was actively seeking workers from outside the firm.

In each area a sample of firms to be surveyed was drawn from the latest (March 1964) tabulation of firms covered by the Indiana Employment Security Act. All firms employing more than 100 people and a sampling of smaller firms in all industries were selected. The number of firms in the sample in each area varied according to the amount of employment and total number of firms in the area. In addition, the largest non-covered firms, consisting of hospitals, government agencies, and other non-profit organizations were surveyed.

Concurrently with the employer survey, local offices reviewed the job orders on file in their offices. At the beginning of the survey period, each local office listed all unfilled openings on job orders placed previously with the office by employers. Many of these firms with job orders on file in the employment office were not selected in the employer survey sample and a few were firms which did not respond to the survey. About 30 per cent of the employer job orders represented firms not included in the survey because they were too small to be covered by the Indiana Employment Security Act or failed to meet the criterion for government and non-profit organizations. In instances where the surveyed firms also had existing openings listed as job orders in the local office, information was used from the job vacancy form and the entry deleted from the unfilled job order count.

EMPLOYMENT SERVICE JOB ORDER REVIEW

Partly to supplement the information obtained from the sample of employers in the job vacancy survey and partly to determine whether or not the kinds of jobs on file in the local employment offices were representative of job vacancies in general, local offices in the seven areas compared job vacancy forms with their unfilled job orders. The local offices had on file 3,221 additional unfilled jobs, as well as about 1,400 of the same jobs that were reported by employers in the survey.

ADDITIONAL JOB ORDERS ON FILE IN LOCAL OFFICES,
BY OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	JOB ORDERS ON FILE	PER CENT OF JOB ORDERS
TOTAL	3,221	100.0 %
Professional	181	5.6
Semiprofessional	93	2.9
Trainees (Prof. & Kindred)	26	0.8
Managerial and Official	91	2.8
Clerical and Kindred	422	13.1
Sales and Kindred	436	13.5
Personal Service	452	14.0
Protective Service	8	0.2
Building Service Workers and Porters	72	2.2
Agricultural, Horticultural and Kindred	17	0.5
Skilled	588	18.3
Semiskilled	426	13.3
Unskilled	409	12.8

A comparison of the distribution of job vacancies with the distribution of total job orders by occupational groups revealed a similarity in the kinds of unfilled jobs with differences in proportion of openings in some occupational groups.

About 72 per cent of the additional openings listed as unfilled job orders were considered hard to fill by the local offices and almost half of these were hard to fill because of the lack of trained applicants; more than 71 per cent had been in the job order file for one week or longer.

The largest number of these additional openings was in skilled occupations; nearly 600 additional openings were on file for primarily the same kinds of workers as reported in the employer survey.

An additional 81 openings for welders, machinists, and tool and diemakers were listed as job orders. Almost all of these openings were considered as hard to fill and more than half of them had been open for one week or longer. There were an additional 67 openings for automobile and truck mechanics and automobile body repairmen and nearly all were considered as hard to fill because of a scarcity of applicants with sufficient training to meet employer needs.

In the professional occupational group, more than one third of the openings were for engineers; almost all were listed as hard to fill and had been open for a week or longer. There were 36 additional job orders listed for draftsmen and

tool designers in the semiprofessional group and over 60 per cent of these were listed as hard to fill, primarily because of need for trained applicants.

In the clerical and kindred groups, the largest number of additional openings on job orders appeared in the occupations of office clerks, stenographers, secretaries, and typists which together totaled 192. In the sales and kindred group there were 196 additional openings for retail sales clerks.

In the personal service group 168 additional job orders for waitresses and countergirls were reported. More than three fourths of these openings were considered as hard to fill, but only a few of these were hard to fill because of lack of trained applicants on file.

In the unskilled group, the largest number of unfilled orders considered as hard to fill was for laborers in the iron and steel and electrical equipment manufacturing industries; almost two fifths of these were considered hard to fill by the local offices because of a shortage of applicants who meet employer requirements of high school graduation with some technical knowledge of the field of electricity.

JOB VACANCY SURVEY RESULTS
EVANSVILLE AREA

During October 1964, 262 firms employing 34,509 people in the Evansville area were contacted by mail or personal visit in the job vacancy survey. Of the 238 firms who responded, 69 firms reported 370 job vacancies in 109 occupations. The responding firms represented 91 per cent of those contacted; employment in the responding firms was 32,855. Total nonfarm employment for the Evansville area in October was 68,600.

The largest number of vacancies reported by employers was in the clerical and sales occupational group. Salespeople for retail trade establishments predominated in this group. Nurses and managers of various kinds constituted almost half of the professional and kindred group vacancies and ward attendants accounted for half of the service industry vacancies. Skilled jobs included arc welders, tool and die makers, mechanics and several occupations in furniture manufacturing. Taxi drivers and machine operator vacancies made up most of the semiskilled group, and the unskilled included a number of laborers in the electrical machinery industry.

Three fourths of the job vacancies were considered hard to fill by the reporting employers: practically all of the professional and kindred and skilled jobs; more than three fourths of the clerical and sales, the skilled, and service jobs; and about one third of the unskilled job vacancies were reported by employers as hard to fill.

TOTAL JOB VACANCIES REPORTED ON SURVEY FORMS AND ADDITIONAL JOB ORDERS ON FILE IN THE LOCAL OFFICE, BY MAJOR OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	JOB VACANCIES REPORTED	PER CENT OF VACANCIES	JOB ORDERS ON FILE	PER CENT OF ORDERS
TOTAL OPENINGS	370	100.0	273	100.0
PROFESSIONAL AND KINDRED	62	16.8	17	6.2
CLERICAL AND SALES	99	26.8	61	22.3
SERVICE	58	15.7	87	31.9
AGRICULTURAL AND KINDRED	0	0.0	1	0.4
SKILLED	39	10.5	36	13.2
SEMISKILLED	72	19.1	42	15.4
UNSKILLED	40	10.8	29	10.6

In addition to the job vacancies reported by the 238 responding firms in the survey, other employers not included in the survey had 273 additional openings in 136 occupations on file as job orders in the Evansville local employment office. The local office also had 11 domestic service openings. These additional job openings included many other sales jobs, cooks, waitresses, nurse aides and kitchen workers. Auto service station attendants and a variety of other semiskilled and skilled jobs were open.

JOB VACANCY SURVEY RESULTS
FT. WAYNE AREA

In October 1964, 330 firms employing 53,879 people in the Ft. Wayne area were contacted by mail or personal visit in the job vacancy survey. Of the 317 firms who responded, 92 firms reported 738 job vacancies in 139 occupations. The responding firms represented 96 per cent of those contacted and employment in these firms totaled 53,686. Total nonfarm employment for the Ft. Wayne area in October was 92,800.

The largest number of job vacancies reported by employers was in the unskilled occupational group. Nearly half of these vacancies were reported by one employer in the electrical machinery industry due to a step-up in production. Openings in rubber, metals and public utility occupations were also prominent in the unskilled group. Engineers constituted more than one third of the professional and kindred openings; almost 70 per cent of the clerical and sales vacancies were in the clerical field. In the skilled group, openings for machinists and tool and die makers constituted more than one fourth of the total; other skills reported were lathe operators, electricians, carpenters, mechanics and service and maintenance men for both equipment and buildings. More than one half of the service openings were for hospital personnel with restaurant and hotel jobs next in line. Openings for taxi drivers and sewing machine operators made up more than one half of the semiskilled job vacancies.

Three fourths of all job vacancies were considered hard to fill by employers. More than two thirds of the unskilled openings were so designated but this is because of rigid physical and educational requirements established by some employers. Nearly all of the professional and skilled openings were classified as hard to fill; 85 per cent of service and semiskilled jobs were also in this category. Sales openings were considered hard to fill in almost all instances but clerical openings less frequently so; less than half of the vacancies in the combined clerical and sales group were considered hard to fill.

TOTAL JOB VACANCIES REPORTED ON SURVEY FORMS AND ADDITIONAL JOB ORDERS ON FILE IN THE LOCAL OFFICE, BY MAJOR OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	JOB VACANCIES REPORTED	PER CENT OF VACANCIES	JOB ORDERS ON FILE	PER CENT OF ORDERS
TOTAL OPENINGS	738	100.0	246	100.0
PROFESSIONAL AND KINDRED	120	16.3	17	6.9
CLERICAL AND SALES	110	14.9	101	41.1
SERVICE	85	11.5	38	15.5
AGRICULTURAL AND KINDRED	0	0.0	2	0.8
SKILLED	91	12.3	20	8.1
SEMISKILLED	64	8.7	30	12.2
UNSKILLED	268	36.3	38	15.4

In addition to the job vacancies reported by the 317 responding firms, other employers not included in the survey had 246 additional openings in 120 occupations on file as job orders in the Ft. Wayne Employment Service office. The local office also had 42 domestic service openings. The largest number

of openings in the local office was for clerical and sales occupations, with about half of these considered hard to fill by the local office because of a lack of qualified or interested applicants. Service and unskilled occupations constituted nearly one third of the local office openings. More than two thirds of the service occupation job openings were considered hard to fill with transportation difficulties most frequently given as the reason. Slightly over one half of the unskilled jobs were hard to fill.

JOB VACANCY SURVEY RESULTS, GARY-HAMMOND-EAST CHICAGO AREA

During October of 1964, 543 firms employing 123,928 people in the Gary-Hammond-East Chicago area were contacted by mail or personal visit in the job vacancy survey. Of the 533 firms who responded, 115 firms reported 1,024 job vacancies in 143 occupations. The responding firms represented a 98 per cent response and employment in these firms was 107,597. Total nonfarm employment for the Gary-Hammond-East Chicago area in October was 190,800.

Of the vacancies reported by the surveyed employers, the largest number was in the unskilled occupational group, which comprised almost half of the total job vacancies reported. More than four fifths of these vacancies were located in the steel mills.

More than one third of the vacancies in the clerical and sales group were for retail salespeople; others were for federal post office mail clerks and carriers, while smaller numbers of vacancies were reported for clerk typists, stenographers and secretaries.

Vacancies for machinists, tool and die makers and welders comprised nearly one half of the total number of vacancies in the skilled group. One third of the vacancies reported in the semiskilled group were for truck drivers and semi-skilled machine operators.

While only a very small percentage of the unskilled jobs were shown as hard to fill by the employers, extensive recruitment was being conducted outside the area by the steel mills for laborers who could meet rigid physical and educational requirements.

More than three fourths of the professional, technical, and managerial and the skilled job vacancies were considered by employers as hard to fill. Fewer than half of the semiskilled, service, and clerical and sales jobs were classified in this category.

TOTAL JOB VACANCIES REPORTED ON SURVEY FORMS AND ADDITIONAL JOB ORDERS ON FILE IN THE LOCAL OFFICES, BY MAJOR OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	JOB VACANCIES REPORTED	PER CENT OF VACANCIES	JOB ORDERS ON FILE	PER CENT OF ORDERS
TOTAL OPENINGS	1,024	100.0	828	100.0
PROFESSIONAL AND KINDRED	75	7.3	54	6.5
CLERICAL AND SALES	110	10.7	192	23.2
SERVICE	37	3.6	49	5.9
AGRICULTURAL AND KINDRED	0	0.0	4	0.5
SKILLED	223	21.8	200	24.2
SEMISKILLED	78	7.6	62	7.5
UNSKILLED	501	49.0	267	32.2

The unskilled group also contained the largest numbers of additional job orders on file in the local office; almost one half of these openings were reported also in the steel industry. The local office considered these jobs as hard to fill in terms of the scarcity of workers who could meet employer specifications.

Structural steel workers, welders, auto mechanics and machinists made up over 57 per cent of the additional openings in the skilled occupational group; all of these were hard to fill because of a shortage of trained applicants.

In the sales and kindred and the personal service groups, openings for retail sales clerks and waitresses - countergirls predominated. Retail sales clerks comprised nearly one half of the additional number of sales and kindred openings; waitresses - countergirls accounted for more than 40 per cent of the total number of personal service openings. Almost three fourths of the additional openings for waitresses - countergirls were listed as hard to fill for various reasons; about two thirds of these were unfilled because some firms were not centrally located, required unusual working hours or did not offer wages or benefits comparable to those in other types of industry. Very few were hard to fill solely because of a lack of trained people. Nearly one half of the orders for retail sales clerks were considered hard to fill for a variety of reasons; one third because of a lack of trained or experienced applicants.

Truck drivers, routemen and auto service station attendants made up one third of the additional job orders in the semiskilled group; nearly 70 per cent of these were listed as hard to fill.

Laborer openings in the unskilled occupational group were scattered throughout many industries with the iron and steel industry predominating. Many of the job openings were reported hard to fill because a high school education was required. Some of the other industries reporting multiple openings were construction, auto repair and wholesale and retail trade.

JOB VACANCY SURVEY RESULTS
INDIANAPOLIS AREA

During October of 1964, 945 firms employing 186,797 people in the Indianapolis area were contacted by mail or personal visit in the job vacancy survey. Of the 928 firms who responded, 287 firms reported 1,776 job vacancies in 323 occupations. The responding firms represented a 98.0 per cent response and employment in these firms was 166,341. Total nonfarm employment for the Indianapolis area in October was 309,600.

Of the vacancies reported by the surveyed employers, the largest number of openings was in the clerical and sales occupational group, which comprised 26.6 per cent of the total job vacancies reported. In the clerical and sales occupational group, general office clerks, stenographers, secretaries, typists, clerk-typists and transcribing machine operators were the most numerous, comprising one fourth of the total number of vacancies in this group. Retail sales clerks accounted for almost 12.0 per cent of these openings.

Waitresses, countergirls and countermen predominated in the service industries, totaling almost one third of the openings in this occupational group; practical nurses, orderlies and nurse aides accounted for more than 20.0 per cent of the vacancies in the group.

Machinists, tool and die makers, and precision machine operators were the most numerous in the skilled occupational group making up more than 40.0 per cent of the vacancies reported in this group.

Most of the professional, technical and managerial jobs as well as skilled jobs were reported by the employer as hard to fill. About two thirds of the service jobs, one half of the clerical and sales jobs, one third of the semi-skilled and only about 12.0 per cent of the unskilled jobs were found hard to fill with qualified applicants by the employer.

TOTAL JOB VACANCIES REPORTED ON SURVEY FORMS AND ADDITIONAL JOB ORDERS ON FILE IN THE LOCAL OFFICE, BY MAJOR OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	JOB VACANCIES REPORTED	PER CENT OF VACANCIES	JOB ORDERS ON FILE	PER CENT OF ORDERS
TOTAL OPENINGS	1,776	100.0	1,115	100.0
PROFESSIONAL AND KINDRED	443	24.9	215	19.3
CLERICAL AND SALES	473	26.6	269	24.9
SERVICE	213	12.0	218	19.6
AGRICULTURAL AND KINDRED	1	0.1	0	0.0
SKILLED	262	14.8	197	17.7
SEMISKILLED	289	16.3	151	13.5
UNSKILLED	95	5.3	65	5.8

In addition to the job vacancies reported by the 927 responding firms in the area, other employers not included in the survey had 1,115 additional openings in 369 occupations on file as job orders in the Indianapolis local office of the Employment Service. The local office also had 181 domestic service openings and 53 commission sales openings.

INDIANAPOLIS AREA - continued

Of the 1,115 additional openings listed in the local office, the largest numbers were reported in the clerical and sales occupational group, which comprised 24.9 per cent of the total. In the clerical and sales occupational group, secretaries, stenographers, typists and clerk-typists accounted for almost one fourth and retail sales clerks made up more than one fifth of the total additional job orders in this category.

Additional job orders in the service group were primarily in the restaurant occupations with cooks, waitresses and countergirls making up a little less than one half of the total additional orders in this occupational group.

Among the skilled and semiskilled additional job orders were listed for welders, machinists, tool and die makers, precision machine operators and craftsmen in the construction industries. Requests for automobile mechanics and automobile body repairmen were also listed; the majority of these as well as the other skilled jobs were considered as hard to fill, primarily because of lack of qualified applicants in the file.

JOB VACANCY SURVEY RESULTS
MUNCIE AREA

During October 1964, 159 firms employing 22,274 people in the Muncie area were contacted by mail or personal visit in the job vacancy survey. All of the firms responded; 45 firms reported 271 job vacancies in 73 occupations. Total nonfarm employment in the Muncie Area in October was 35,900.

The largest number of openings was in the skilled occupational group. Tool and die makers, platers, machinists, jig-boring and other types of machine operators, welders, auto body repairmen and carpenters were listed among the skilled job vacancies. Almost as many semiskilled job vacancies were shown, including assemblers, buffers and taxi and truck drivers. Half of the professional and kindred jobs vacant were for engineers and draftsmen. Most of the clerical and sales group job vacancies were for office clerks.

More than two thirds of all the job vacancies were considered hard to fill by the employers reporting them. Although only a few service openings were reported, all were listed as hard to fill; about 90 per cent of the professional and kindred jobs and the skilled jobs were reported as hard to fill. Around half of clerical and sales and semiskilled jobs were in the hard-to-fill category. Only one of the 13 unskilled jobs was reported hard to fill.

TOTAL JOB VACANCIES REPORTED ON SURVEY FORMS AND ADDITIONAL JOB ORDERS ON FILE IN THE LOCAL OFFICE, BY MAJOR OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	JOB VACANCIES REPORTED	PER CENT OF VACANCIES	JOB ORDERS ON FILE	PER CENT OF ORDERS
TOTAL OPENINGS	271	100.0	239	100.0
PROFESSIONAL AND KINDRED	41	15.1	25	10.5
CLERICAL AND SALES	26	9.6	49	20.5
SERVICE	5	1.9	27	11.3
AGRICULTURAL AND KINDRED	2	0.7	1	0.4
SKILLED	99	36.5	46	19.2
SEMISKILLED	85	31.4	72	30.1
UNSKILLED	13	4.8	19	8.0

In addition to the job vacancies reported by the 159 responding firms, other employers not included in the survey had 239 additional openings in 101 occupations on file as job orders in the Muncie local office of the Employment Service. More than one half of these were listed as hard to fill. The local office also had 49 domestic service openings and 5 commission sales openings. The largest number of openings in the local office was in the semiskilled occupational group; more than two thirds of these were hard to fill for a variety of reasons but very few were unfilled due to shortage of trained applicants.

JOB VACANCY SURVEY RESULTS
SOUTH BEND AREA

During September of 1964, 331 firms employing 44,199 people in the South Bend area were contacted by mail or personal visit in the job vacancy survey. Of the 305, or 92.0 per cent, who responded, 385 job vacancies were reported in 140 occupations. Employment in the responding firms totaled 42,746. Total nonfarm employment in the South Bend area in September was 77,400.

Of the vacancies reported by the surveyed employers, the largest number of openings was in the professional and managerial occupational group, which comprised 23.3 per cent of the total job vacancies reported. Almost three fourths of these openings were for engineers and nurses, and practically all were considered hard to fill. More than 20.0 per cent of the vacancies in the clerical and sales occupational group were for retail sales clerks; most of them were hard to fill.

Restaurant workers made up 92.0 per cent of the vacancies reported in the service occupational group and more than one half of these were waitresses and cooks; all vacancies except one were considered by the employer as hard to fill.

TOTAL JOB VACANCIES REPORTED ON SURVEY FORMS AND ADDITIONAL JOB ORDERS ON FILE IN THE LOCAL OFFICE, BY MAJOR OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	JOB VACANCIES REPORTED	PER CENT OF VACANCIES	JOB ORDERS ON FILE	PER CENT OF ORDERS
TOTAL OPENINGS	385	100.0	378	100.0
PROFESSIONAL AND KINDRED	90	23.3	39	10.3
CLERICAL AND SALES	75	19.5	101	26.7
SERVICE	75	19.5	91	24.1
AGRICULTURAL AND KINDRED	1	0.3	8	2.1
SKILLED	79	20.5	69	18.3
SEMISKILLED	40	10.4	58	15.3
UNSKILLED	25	6.5	12	3.2

In addition to the job vacancies reported by the 305 responding firms in the area, other employers not included in the survey had 378 additional openings in 164 occupations on file as job orders in the South Bend local office of the Employment Service. The local office also had listed 113 domestic service openings.

Of the 378 openings listed in the local office, the largest numbers were reported in the clerical and sales occupational group, which comprised 26.7 per cent of total job orders on file. More than 89.0 per cent of the total number of additional openings were considered hard to fill. In the clerical-sales group, retail sales clerks made up almost one fourth of the total number of additional job orders; most of these were hard to fill. More than two thirds of the unfilled orders in the service group were for waitresses and cooks; all of these were hard to fill.

JOB VACANCY SURVEY RESULTS
TERRE HAUTE AREA

During October of 1964, 166 firms employing 16,381 people in the Terre Haute area were contacted by mail or personal visit in the job vacancy survey. Of the 154 firms who responded, 25 firms reported 110 job vacancies in 40 occupations. The responding firms represented a 93.0 per cent response and employment in these firms was 15,771. Total nonfarm employment in the Terre Haute area in October was 36,700.

Of the vacancies reported by the surveyed employers, the largest number of openings was in the clerical and sales occupational group, which comprised 36.3 per cent of the total job vacancies reported. Half of these vacancies were for key-punch operators involving one employer. Three fourths of the clerical and sales vacancies were considered by the employers as hard to fill. Ninety per cent of the professional, technical and managerial jobs but only about one third of the unskilled jobs were classified as hard to fill.

TOTAL JOB VACANCIES REPORTED ON SURVEY FORMS AND ADDITIONAL JOB ORDERS ON FILE IN THE LOCAL OFFICE, BY MAJOR OCCUPATIONAL GROUP

OCCUPATIONAL GROUP	JOB VACANCIES REPORTED	PER CENT OF VACANCIES	JOB ORDERS ON FILE	PER CENT OF ORDERS
TOTAL OPENINGS	110	100.0	117	100.0
PROFESSIONAL AND KINDRED	30	27.3	16	13.7
CLERICAL AND SALES	40	36.3	59	50.4
SERVICE	12	10.9	22	18.8
AGRICULTURAL AND KINDRED	0	0.0	1	0.8
SKILLED	7	6.4	5	4.3
SEMISKILLED	1	0.9	7	6.0
UNSKILLED	20	18.2	7	6.0

In addition to the job vacancies reported by the 154 responding firms in the area, other employers not included in the survey had 117 additional openings in 65 occupations on file as job orders in the Terre Haute local office of the Employment Service. The local office also had 44 domestic service openings and 19 commission sales openings.

Of the 117 additional openings listed in the local office, the largest numbers were reported in the clerical and sales occupational group, which comprised 50.4 per cent of the total. Almost one third of the orders in this group were for wholesale and insurance salesmen; most of these were considered hard to fill. Restaurant workers comprised the majority of the openings in the service group with about two thirds of the additional orders represented by waitresses and cooks. Most of these were considered hard to fill, although seldom because of a shortage of applicants.

BACKGROUND INFORMATION

In 1964, Indiana nonfarm employment reached record levels, and unemployment as a per cent of the work force was consistently lower than the national experience. Even so, unemployment numbered many thousands in the State and was unevenly distributed by area, by skill level, and by personal characteristics. The under-developed areas, and areas which had lost firms or employment in existing firms were exceptions to the general high-employment level. Less skilled workers, youth entering the labor force, older workers, and minority groups experienced disproportionately high unemployment rates.

Employment in the seven largest labor market areas of the State was at or near the peak for the year during the survey period (in two areas labor disputes held down October employment totals). In each area, except South Bend, nonfarm employment was above the corresponding period in 1963 and the unemployment rate below the year-ago rate. The State and area rates, except South Bend, were all below the national rate of 4.4.

NONAGRICULTURAL EMPLOYMENT AND UNEMPLOYMENT IN SEVEN AREAS, OCTOBER 1964

	Nonagricultural Employment	Unemployment	Unemployment Rate
Evansville	68,600	2,200	2.8
Ft. Wayne	92,800	1,900	1.8
Gary-Hammond-E. Chicago	190,800	4,700	2.2
Indianapolis	309,600	8,200	2.3
Muncie	35,900	1,700	3.7
South Bend*	77,400	5,300	5.9
Terre Haute	36,700	1,400	3.2
State	1,556,700	58,000	3.1
*South Bend (Sept.)	77,500	6,200	6.8

It was in this setting of high employment and spotty unemployment that the Indiana Employment Security Division undertook to broaden its knowledge of the kinds and numbers of jobs unfilled in industry through the vacancy survey of a sample of employers. Since 1961, the Division has been placing heavy emphasis on obtaining information about occupational opportunities and outlook through continuing analysis of job orders received in local offices, by employer surveys in selected industries, by special surveys in selected areas, and, in 1962, through a 30-area employer survey of shortage occupations. The job vacancy study differed from these in that the survey penetrated all types of industry and included information about all unfilled jobs in surveyed firms, whether or not the unfilled jobs were considered hard-to-fill, or shortage, occupations.

Information on the Milwaukee Vocational, Technical and Adult Schools' Program for Compulsory Attendance Age Students. Staff Brief I.

Wisconsin Legislative Council, Madison. Educational Committee
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 28Jan66 7p.

*VOCATIONAL EDUCATION; HIGH SCHOOL STUDENTS; *VOCATIONAL SCHOOLS; EDUCATIONAL NEEDS; STUDENT ENROLLMENT; *CONTINUATION EDUCATION; PROGRAM DESCRIPTIONS
MILWAUKEE; WISCONSIN

The summary information regarding the Milwaukee Vocational, Technical, and Adult School's (MVTAS) program for compulsory attendance age students was prepared as a supplement to the Legislative Council Staff Report on Vocational Programs for Compulsory Attendance Age Youth in Wisconsin. The MVTAS consists of five divisions operating as components of the single institution: (1) Milwaukee Institute of Technology, (2) continuation school, (3) apprentice school, (4) adult high school, and (5) adult school. General information on enrollment and attendance in all the school's programs is presented, but the continuation school, which serves the compulsory attendance age student who is not attending high school, is the only one discussed. The student's first quarter in the continuation school is devoted to determining his abilities and interests and acquainting him with the program. When he chooses a program, he spends half the time in a work area and half the time in general education. Work area courses are available in business, graphic and applied arts, home economics, and industrial. General education subject areas are social studies, practical English, driver education, physical education, consumer education, safety, social relations, and special-purpose subjects. Students with good records are entitled to the help of the MVTAS placement department. Some conclusions were: (1) The unique problem of youth who enroll in vocational programs must be recognized by the faculty of the institution providing the training, (2) Although enrollment in the continuation school has decreased, the needs of those remaining students evidently cannot be easily met by the comprehensive high schools without a specialized program, and (3) These young people will be the educational responsibility of the vocational school system when they become 18 years of age. STAFF BRIEF I

INFORMATION ON THE MILWAUKEE VOCATIONAL, TECHNICAL AND ADULT SCHOOLS' PROGRAM FOR COMPULSORY ATTENDANCE AGE STUDENTS

At the request of the legislative council staff, the head of the student services division of the Milwaukee vocational, technical and adult schools [MVTAS] provided information on the MVTAS program for compulsory attendance age students. This staff brief summarizes that information. This staff brief, in effect, supplements the Legislative Council Staff Report on Vocational Programs for Compulsory Attendance Age Youth in Wisconsin, (SR-67-1), January 28, 1966.

The MVTAS consists of 5 divisions, which operate as components of the single institution. Each of the 5 divisions, or schools, has its own curriculum, its own objectives, and in the main, its own student body. These 5 schools include: (1) Milwaukee Institute of Technology; (2) continuation school; (3) apprentice school; (4) adult high school; and (5) adult school. The continuation school serves the compulsory attendance age student who is not attending a high school. At the present time 37 persons are spending 50% or more of their time working with continuation students at the MVTAS.

Enrollment data on the MVTAS are found in 2 tables at the end of this brief. Table 1 gives the cumulative enrollments in the 5 schools from 1954-55 through 1964-65. Table 2 is a further refinement of the enrollment data for the MVTAS from 1954-55 through 1964-65.

In order to enroll in the continuation school, a student secures a transfer from the high school he is attending. Prior to registering at the continuation school the student, and at least one of his parents, is required to attend a counseling session at the MVTAS at which time the work at the vocational school is explained. This counseling session is intended to make clear to both the prospective student and his family what are the differences between the educational programs available at the vocational school and the high school. The continuation school program is not designed

VT003301

to teach a student a trade immediately, but is geared to determining whether the student has the ability to learn enough arithmetic and reading to progress toward a trade and whether the student has the special ability to progress in any of the trade areas.

A compulsory attendance age student entering the MVTAS continuation school normally must complete the first quarter of his work in what is called the "diagnostic quarter." The diagnostic quarter plan is devoted to determining what are the abilities and interests of the student and to acquaint the student with the programs available at the vocational school. If a student is recommended by his high school principal as having the ability to progress and to be dependable, the diagnostic quarter is not necessary.

At the end of the first quarter, the student decides upon a program that best fits his abilities and interests. This program usually consists of one-half time in some work area and one-half time in general education. The work area courses enable a student to gain work experience and to develop good work habits and attitudes which may help him get initial employment. Students in the continuation school who want to qualify for better employment opportunities are urged to complete their high school education and then to enter a chosen field through an apprenticeship program or through completion of a special program in the MVTAS adult school.

Work area courses are available in the following fields: (1) business; (2) graphic and applied arts; (3) home economics; and (4) industrial. The general education subjects include: (1) social studies; (2) practical English; (3) driver education; (4) physical education; (5) consumer education; (6) safety; (7) social relations; and (8) special-purpose subjects.

Continuation students with good school records are entitled to have the help of the MVTAS placement department. The placement department usually requires the student to be at the vocational school for some time before referring him to a job. However, if the student has a good high school record and is recommended by the principal as being regular in attendance, dependable and able to get along with people, the student is eligible for job placement help at once.

There is no formal arrangement between the MVTAS and the local high schools under which regular full-time high school students can take courses at the MVTAS for which the student receives credit toward high school graduation. However, many high school principals will accept credits earned at the MVTAS. The credits usually are earned through the evening school program. Sometimes, the student who is about ready to

graduate from high school will be permitted to secure his last one or 2 credits at the MVTAS. Normally this is done through the adult high school division. Occasionally a principal will evaluate shop work at the MVTAS in determining whether a student is eligible for high school graduation.

The MVTAS reports that up to the present time the only problem which has arisen under the new compulsory attendance law is associated with those students who were already working. [The new law requires students in Milwaukee who are not in high school to attend the vocational school full-time until age 18.] The MVTAS is enforcing the full-time attendance requirement; but individual exceptions to the full-time requirement have been made in the case of students already working, where it was felt that it was in the best interest of the student that he continue to work. Usually such students have been required to either attend the vocational school half-time or in the evening.

Regardless of whether the high schools or the vocational schools provide vocational type programs for the compulsory age youth, it is the opinion of the MVTAS that the unique problem of the youth who enroll in vocational programs must be recognized by the faculty of the particular institution. It was pointed out by the MVTAS that while the number of students in the continuation school program has decreased steadily over the years, "this only means that the group that is left has needs that are not easily met by the comprehensive high school without a specialized program." It also was noted that these young people will be the educational responsibility of the vocational school system when they become 18 years of age.

TABLE 1

Milwaukee Vocational Technical and Adult Schools
Cumulative Enrollment Reports by Schools
1954-55 to 1964-65

	Continuation	Apprentice	High School	Adult	MIT	Cumulative
64-65	1,770	1,033	2,056	21,283	11,494	37,636
1963-64	1,809	920	1,927	21,627	9,596	35,879

Pub Date - 30Nov62 4p.

*CORRESPONDENCE STUDY; *ADULT VOCATIONAL EDUCATION; *PROGRAM DESCRIPTIONS; EDUCATIONAL BENEFITS

Correspondence training has been overlooked by many employers although 7,000 businesses and 10 million people have used corespondence study. Some advantages of correspondence education are that it permits students to study subjects at numerous educational levels, students can complete instruction in short time or over an extended period, it meets the diversified interests and needs of people who have unlike backgrounds and differing abilities, it can be the most economical way of training workers, no time is lost from the work day, and courses can be specific, concentrated, and applied immediately to work. Although learning without a teacher's presence and lack of classroom stimulation may be limitations, they are minor when compared to no training at all. Over 800,000 persons are enrolled in 56 accredited schools, and an estimated 700,000 are enrolled in nonaccredited schools. A cooperative training plan can be developed whereby the employee pays the original tuition, and the company refunds part of all of the costs on completion of the training. The United State Chamber of Commerce has compiled a list of accredited schools with over 400 course offerings. Documents treating other business training and retraining programs are available as VT 003 415-VT 003 427. (MM)

Accredited Correspondence Education

AN ANSWER TO TRAINING NEEDS OF BUSINESS

The secret is long out: business and industry desperately need trained and trainable employees at all levels and in all fields—managerial, technical, administrative, machine operators, clerical. From 1960 to 1970 the U. S. Labor Department estimates* that we shall need

41% more professional and technical personnel;
27% more clerical and sales trained personnel;
24% more proprietors;
24% more skilled workers;
18% more semi-skilled workers;
25% more service workers;
0% unskilled (No Increase).

Millions of jobs will become available by 1970, but—at the present rate of training—we could have many unemployed.

Expanded Training Capability Needed

What is the answer? Employers have found only a small part of the answer in variations of the traditional classroom method of training. In-plant instruction, short courses, evening classes, late afternoon classes, Saturday morning classes, early morning television, and off-campus programs to outlying communities have *not* supplied enough training fast enough to enough employees at costs which are economically feasible. Although they are unable to provide the mass vocational training required to meet the automation revolution that even now is well under way, these traditional methods should be continued, supported, and used more intensively than ever. However, there is at least one other training method that can be called on to help in the task before us.

Correspondence Education Industry-Tested

In looking for the answer, we found that most employers, large and small, have overlooked a method that has been used most effectively in a limited way for a long time—CORRESPONDENCE TRAINING. It is true that 7,000 businesses and industries have used and more than 10 million people have been instructed and upgraded through correspondence study, but from what we have been able to learn, the vast potential of the method remains largely untapped. Based on our probe, the results are good. One company, for instance, reports its maintenance and repair costs were reduced 30% as a result of a company correspondence program.

* *Does not include replacements.*

Why correspondence? Because we need an approach which will provide a wide range of course offerings while allowing for development of the individual learner's ability. Most vital: home study permits the trainee to adjust to the time and place of study. The mass training of individuals for their work today and tomorrow requires an approach which is flexible. It must

- permit students to study subjects at numerous educational levels;
- allow them to complete instruction in a short time or over an extended period—at their own choice;
- meet the diversified interests and needs of people who have unlike backgrounds and differing abilities.

After surveying the problem and looking at the methods, it appears that correspondence education provides the majority of blue and white-collar workers a convenient and a valuable means to participate in a learning situation on an organized basis.

Correspondence Method Sound

In the past, some have had doubts about the correspondence method. It probably is true that a serious student who has the benefit of a skilled and competent teacher and a well-organized curriculum can learn and learn well in the classroom—perhaps better than in any other way. The employer's problem is: how to get the student and the teacher together—the teacher teaching and the student learning the subject matter needed for the efficient operation of your industry or business. Without an expensive in-plant training pro-

Correspondence student experiments with electronics equipment built from training kit supplied by one of the 56 accredited correspondence schools.

VT003414

gram, the problem often is insurmountable, and the training is neglected. As a result your business continues to produce at a status-quo rate; you are unable to expand production and to increase the profit margin obtained by greater volume.

Actually, all of the ingredients of any learning situation are present: the student, the instruction materials, and the instructor. The difference is that communication between teacher and student takes place through the written rather than the spoken word. This appears to have advantages; students must learn every part of the subject matter and respond in writing to every part of every lesson. In contrast, not everyone has the opportunity to recite at every meeting of every class on all parts of the subject under discussion. Students studying University of Wisconsin correspondence courses learned just as well as in a lecture course where they were able to question their instructor directly, research has brought to light. Although the test scores of students taking classroom and correspondence courses did not vary significantly, a University of Michigan study showed that home study students retested four months after taking a course retained more than the regular classroom group.

Employee Incentive—Future Job Capacity

Motivation? It appears to be built-in. If your people need to know more to increase production, to keep their jobs, to advance within the company, to prepare for major or minor changes within your plant in the future, you should have no trouble encouraging good personnel to study in their off-hours. If they are reimbursed, in whole or in part, for costs upon completing the course, good employees will find this additional incentive hard to resist. Employees provided this motivation will come to know that their company not only has an enlightened self-interest, but it also has the interest of its employees at heart—an important factor in reaching maximum production in any business, large or small.

Role of Correspondence Courses in Business, Military and Government

Most Americans are not aware of the role correspondence education is playing in business, in the military and in government. In industry, more than 7,000 (including over 290 of the largest) business firms use it or carry out all of their training through correspondence. Most recent enrollment figures show:

- about 1,000,000 active and reserve military personnel are enrolled in military-type courses through one of the services;
- 240,000 active duty military personnel are enrolled in academic courses through the Armed Forces Institute;
- 100,788 are enrolled in vocational and cultural courses in 45 colleges and universities;
- 800,000 are enrolled in 56 accredited schools, according to the National Home Study Council, in technical, vocational, and high school-level courses;
- an estimated 700,000 are enrolled in non-accredited schools.

Directory of Accredited Schools Available

How can employers be certain that their employees will receive quality courses, that the business ethics of the schools are reliable? We knew you would need help in this area. Although substandard schools operate from coast to coast, we were able to obtain a list of accredited schools and their course offerings in more than 400 subject areas. Write to us, and we shall send you a limited number of directories without charge.

The educational service and reliability of accredited correspondence schools have been gone over by an independent Accrediting Commission which is approved by the U. S. Office of Education as a "nationally recognized accrediting agency." Having looked at the accrediting standards, we are convinced that the Commission's standards for a school are rigorous, indeed:

- It has a competent faculty;
- It offers educationally sound and up-to-date courses;
- It screens students carefully for admission;
- It provides satisfactory educational services;
- It has demonstrated ample student success and satisfaction;
- Its tuition charges are reasonable;
- It advertises its courses truthfully;
- It is financially able to deliver a high quality of educational service.

Employer and Employee Gains from Correspondence Education

Having been satisfied that the high standards provided ample protection, we checked more thoroughly into the advantages employers and employees could expect from correspondence study. From our research, we have found that those business and industry operatives which use home study to train employees utilize it for several reasons:

- Many workers can be trained in different fields at the same time;
- Each worker can learn at his own rate because study is carried out on an individual student basis;
- As a method of training workers, it can be the

AFBCOCTV

Mr. Samuel Thompson, pictured above, has taken many correspondence courses which have prepared him for his present position as Project Coordinator for RCA's Data Communication Computer line. He graduated from high school in 1944 and accepted a job as a laborer in RCA's Camden, N. J., plant. At this time he began taking correspondence courses in business. This was a fundamental or beginner's course. He was then promoted to the occupation of Stockman, at which time he continued this correspondence program. Upon completion, he was promoted to the position of Inventory Clerk. Realizing his need for a background in mathematics in order to advance further, he took correspondence courses in general mathematics and followed that with advanced mathematics. After this he entered the armed services and during his eighteen months in the service took USAFI correspondence in the field of accounting. Upon returning from the service, he was re-employed in his old job as Inventory Clerk and then promoted to Cataloger Compiler. During this time he pursued studies in English and business at Woodrow Wilson Evening School. After the completion of this training, he became a Parts Specialist for RCA's computer line. During the one and one-half years he was a Parts Specialist, he took business courses specially tailored to his needs by a correspondence school. His next position was that of Leader, Inventory Control—he held this position for two years. Six months ago, he was promoted to his present position. Needless to say, he is planning for new programs of study. This case study demonstrates vividly how a person can prepare himself for new opportunities in business and, at the same time, business also benefits through such well-educated employees.

most economical way. (A full in-plant training program is expensive and usually insufficient to meet multiple company needs.)

Still other employer advantages were uncovered:

- No time is lost from the work day;
- Home study can be tied into an in-service training program, and examinations and progress can be checked by company supervisors and training personnel;
- Certain schools can provide diagnostic testing services for business and industry embarking on a group training effort by means of home study. Testing is used to find the skill-knowledge level of employees in order to design a course which will begin and continue training at a proper level for employees, as well as meet the company's training objectives;
- Courses are specific and concentrated; the emphasis is on learning which can be applied immediately to the employee's work. Courses range from air conditioning, arithmetic, and architecture, to welding, wiring, and work simplification.

In a recent survey of hundreds of correspondence school graduates, the employee gains were significant. Here is a summary of the findings among students:

- They learned from the course what they anticipated it would provide;
- Based on prior earnings, pay increases averaged $22.50 per week—about 90% received those increases;
- They were promoted (over 40%) or were able to relocate in better jobs;
- Graduates were well satisfied—in fact, enthusiastic—about the quality of the subject matter as well as the correspondence study method;
- More than three-fourths of the men reported receiving better wages;
- More than three-fifths said they now had a better chance for promotion;
- More than one-third emphasized receiving a greater supervisory role;
- Three-tenths of the respondees reported that their status in the neighborhood where they lived had improved;
- More than half of those surveyed felt better about their work;
- More than four-fifths of the students said that they would study through home study if they had to make the choice again.

In addition to these advantages, several personal benefits were noted:

RECENT ANNUAL ENROLLMENTS IN HOME STUDY COURSES OF SPECIAL INTEREST TO BUSINESS & INDUSTRY

This graph provides a comparison of subject area enrollments selected by new students enrolled in accredited home study courses in one year. 558,747 of 860,190 students chose courses vocationally beneficial for working adults.

- Employees can pay for the courses by installment as they learn;
- Each man receives individual attention from the instructor;
- A student can study subjects not available locally —business courses, skilled trades, preparation for professional licenses, hobbies, academic subjects;
- Employees can continue to learn while remaining at home and can do it without travel;
- Where the skill requires equipment, a kit often is furnished giving a student practice in his skill— e.g., assembling a radio or TV set as part of a course.

Still another benefit: many adult workers have dropped out of high school and now want and need a high school program both for background and basic skill knowledge. High school programs and preparation for an equivalency diploma are offered through home study. With high school training, an employee then can fruitfully continue his education in courses dealing with his particular job.

Tuition Reimbursement Plan

Savings for employers and employees? As compared to in-plant training, the savings are considerable, even if the company supports a Cooperative Refund Plan for employees. If a firm needs additional skill development among its employees in a reasonably short time, it is wise to start a Cooperative Training Plan. In this program, an employee pays the original tuition and training costs, and the company refunds part or all of the costs on satisfactory completion of training. A brochure describing variations of the plan will be sent to anyone requesting it.

Noteworthy under a Cooperative Training Plan are the tax considerations:

- For the company, tuition refunds are written off as operating expenses;
- For the employee, under Treasury Ruling, expenditures for education are deductible if undertaken primarily for maintaining or improving skills required by the student to perform duties of employment "when the educational expense was incurred," or for meeting the mandates of the employer who has imposed the educational requirement "as a condition for the retention by the student of his salary, status, or employment."

Correspondence Education Offers Many Advantages

For some employees, correspondence courses have certain limitations. For instance:

- Learning without a teacher standing over them may be difficult.
- Classroom stimulation may seem necessary for learning.

These limitations are minor when compared with the need for another educational tool. The new demands on education require methods which do not take men and women out of the labor force; methods flexible enough to keep pace with rapid change; and methods capable of maintaining high quality during periods of unparalleled growth. Home Study meets some of these demands, and in our view it has become a significant part of the new adult education.

On request, we shall send you additional information on correspondence education.

Apprenticeship, An Answer to Training Needs of Business. Washington Report, Special Supplement; Feb. 8, 1963.

Chamber of Commerce of the United States, Washington, D.C.
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 8Feb63 4p.

*APPRENTICESHIPS; ADULT VOCATIONAL EDUCATION; *EDUCATIONAL BENEFITS

Apprenticeship is a method of learning a skill through a predetermined schedule or training outline which consists of not less than 4,000 hours of on-the-job training and related theoretical instruction. Apprenticeship is not limited to any single business or industry. Manufacturing, construction, utilities, and trade and service have trained apprentices for years. Expansion in apprentice employing industries during 1960-1970 has been projected as (1) construction, 30 percent, (2) trade and services, 25 percent, (3) manufacturing, 15 percent, (4) transportation, utilities, and mining, 5 percent. There are 8.5 million skilled workers in all industries. Fewer than 60,000 apprentices completed their programs in 1960-61. Planned training pays dividends to the employer in terms of assured skilled workers, lower production costs, satisfied customers, reduced labor turnover, reduced supervison, and a source of supervisory personnel. A study of apprentices 6 years after completing the program showed that more than one-fourth had advanced to supervisory positions, and 93 percent had used the skills they learned. The U.S. Department of Labor, Bureau of Apprenticeship and Training provides consultant services to employers on request. Addresses of regional bureaus are included. Documents treating other business training and retraining programs are available as VT 003 414-VT 003 427. (MM)

Apprenticeship

AN ANSWER TO TRAINING NEEDS OF BUSINESS

What is Apprenticeship?

Leaders of business and labor who are serving on the Federal Committee on Apprenticeship define apprenticeship as a method of learning a skill through a predetermined schedule or training outline which consists of not less than 4000 hours (a minimum of 2 years) of on-the-job training and related theoretical instruction.

An apprentice learning a skill receives on-the-job training, but a person receiving on-the-job training is not necessarily an apprentice. To avoid confusion, the above definition is utilized in this supplement.

EDITOR'S NOTE: This is the second in a series of Special Supplements on training and retraining programs utilized by business firms. The first, "Accredited Correspondence Education," published in the November 30, 1962, issue of *Washington Report*, was received enthusiastically by company officials and by personnel and training directors. If you missed this supplement, you may obtain a complimentary copy upon request to the National Chamber. A third in this series will feature "On-The-Job Training" and will be printed in a later issue of *Washington Report*. If you have developed a unique training program that might be of interest to other businessmen, please send details to the Education Department.

Voluntary Skill Development Encourages Individuality

Progress of business and industry in the United States is attributed to the principle that an individual is free to develop his skills. This benefits him, his employer, his family, the community and, most important, contributes to the democratic way of life. Most employers agree that employees have an inherent potential in three basic areas:

- **Attitude**
- **Skill**
- **Knowledge**

Effective Training

Business and industry can limit employee effectiveness by refusing to recognize that planned training will motivate a qualified person to develop his skills while he is acquiring both maturity and judgment. Often creativeness exists, but needs the stimulation of management.

What Apprenticeship Does

Apprenticeship provides employers with an effective training plan whereby employees help themselves develop a wide and diverse range of skills. As a training plan, it is designed to afford a qualified person an opportunity to earn while he learns a skilled occupation. A sound apprenticeship program stresses quality workmanship and creates a keen sense of its awareness in the apprentice. An integral part of his training is that he is taught to recognize the full meaning of quality workmanship and intuitively strive for it in his work.

Who Uses Apprenticeship?

Apprenticeship by its very nature is not limited to any single business or industry. Business and industry in the four major groups—manufacturing, construction, utilities, and trade and service—have trained apprentices for many years.

Jerome Kessler, right, Certified Prosthetist at Kessler Associates Inc., Newark, New Jersey, instructs Robert Hessberger in the finishing processes for plastic laminating. Hessberger, who has a post-polio disability, is serving his apprenticeship as an artificial limb maker.

VT003415

"Build the People— The People Will Build the Planes"

"Our job is to build people. The people will build the airplanes." With these words, Robert E. Gross, the former chairman of the board and chief executive officer of Lockheed Aircraft Corporation, set the pace for the company's apprenticeship program.

A Voluntary Training Program

Apprenticeship is a completely voluntary training program on the part of both business and industry. They are responsible for its administration, operation, and the effect it has on the community and the nation. Specifically, management and labor, when employees are affected by a bargaining agreement, jointly decide on the terms and conditions under which apprentices are employed. When employees are not covered by a bargaining agreement, management develops the necessary mechanics of its apprenticeship plan.

The Apprentice

- learns and earns while on the job
- studies related theoretical subjects
- produces during his training
- is paid and his production is sold
- has a written or oral agreement covering terms and conditions of his employment and training plan

The person pictured above is Frederic Rutherford, plumbing-pipe-fitting apprentice of the Ford Motor Company, Dearborn, Michigan. He began his apprenticeship in August, 1960, and now is assigned to the coke oven-blast furnace operation in the Rouge manufacturing area. Before he completes his apprenticeship, he will have worked in nearly every Rouge facility where his kind of skill is needed.

Apprenticeable Occupations

Occupations generally recognized as suitable for apprenticeship are those which can be learned through two or more years of training and work experience on the job. Traditionally these include such skilled occupations as electrician, plumber, carpenter, tool and die maker, stationary engineer, machinist and printer. However, there are large numbers of other apprenticeable occupations less commonly known. Some of these are:

Aircraft Mechanic
Artist—Sign, Scene & Pictorial
Baker
Barber
Bookbinder
Brewer
Butcher-Meat Cutter
Candy Maker
Cook
Cosmetician
Dairy-Products Maker
Dental Technician
Draftsman & Designer
Dry Cleaner, Spotter & Presser
Electronic Technician
Electroplater
Engraver
Floor Coverer
Foundryman
Furrier
Heat Treater
Helicopter Mechanic
Jeweler
Leather Worker
Mattress Maker, Custom
Musical Instrument Mechanic
Optical Technician
Photographer
Tailor
Textile Technician Mechanic
Upholsterer
Wire Weaver
X-ray Equipment Mechanic

Projected Needs

From 1960 to 1970, the U. S. Department of Labor estimates this nation will need 24 percent more skilled workers. There are now approximately 8.5 million skilled workers in all industries. Fewer than 60,000 apprentices in registered programs completed their apprenticeships in 1960 and 1961.

Expansion in apprentice-employing industries during the current decade (1960-1970) has been projected as follows:

Construction	up 30% or more
Trade and Services	up 25% or more
Manufacturing	up 15% or more
Transportation	up 5% or more
Utilities	up 5% or more
Mining	up 5% or more

Business and industry need versatile, easily retrainable skilled workers. A number of highly skilled workers are unemployed because they are unable to adapt their skills to the changing needs of industry.

The day of the specialist is fast losing its status in some industries. When business and industry must adapt to technical changes, their employees also must retrain to acquire essential new skills. As the number of apprentices decreases, business and industry become less able to keep pace with current market demands.

Information, Research Division, Bureau of Apprenticeship and Training, U. S. Department of Labor.

Planned Training Pays Dividends in Terms of:

Company Security—Planned training assures an adequate supply of skilled workers trained in efficient methods of production.

Lower Production Costs—Planned training decreases production costs by reducing waste. The more skilled are the workers, the less spoiled are the materials.

Satisfied Customers—Skilled workers, trained in accuracy and precision, assure customers of high-quality products.

Reduced Labor Turnover—Planned training provides opportunities for advancement within the organization, thus tending to decrease the frequency of hiring and rehiring.

Reduced Supervision—Planned training develops the ability and initiative of the work force. Trained workers require minimum supervision in planning and performing their assignments.

Source of Supervisory Personnel—Planned training prepares skilled workers for advancement to supervisory jobs.

National Security—The development of the nation's skilled manpower through planned training is as important to our national security as is the training of men for the armed forces.

Looking Ahead—Technical developments in the years immediately ahead will require a work force possessing high skills and creativity. New industrial techniques will necessitate additional skills and new twists to existing skills. Planned training is a necessary tool for progress.

What Happens to Those Completing Apprenticeships?

A study made by the Department of Labor's Bureau of Apprenticeship and Training to determine what happens to apprentices after they complete their training disclosed that:

Six years after completing:

- More than one-fourth had advanced to supervisory positions or had become managers or proprietors of their own businesses
- 93 percent had made specific use of the skills learned during their apprenticeships
- Only 7 percent had gone into completely different types of work
- Virtually all were highly enthusiastic about apprenticeship training

John D. Dewhurst, President of the Arrow Tool Company, Inc., Wethersfield, Conn., is pictured above (at left) discussing a die model with one of the company's executives. Mr. Dewhurst got his training through an apprenticeship program as a graduate tool and die maker apprentice from Underwood Elliott Fisher. In addition to running his own company, he is President of the National Tool, Die & Precision Machining Association, located in Cleveland, Ohio.

Where and How Many Apprentices are Employed

The U. S. Department of Labor's Bureau of Apprenticeship and Training reports there are more than 150,000 registered apprentices in training, most of whom are in construction industries. Of course, there are a number of apprentices being trained in other industries. The following graph shows distribution of registered apprentices by industry:

Apprentices are being trained in every state in the union, for example:

- Aero-Jet Mechanics ..... in California
- Electronic Technicians .... in Massachusetts
- Foundrymen ..... in Pennsylvania
- Furriers ..... in Alaska
- Maintenance Mechanics in Pineapple Plants ..... in Hawaii
- Tool & Die Makers ..... in Michigan

The number of apprentices must be substantially increased to meet scientific and technological innovations in business and industry. Those now in training are insufficient to cover losses resulting from deaths, retirements and transfers to other occupations, to say nothing of meeting demands for supervisors, foremen, and industrial managers.

DO YOU KNOW . . .

The U. S. Department of Labor's Bureau of Apprenticeship and Training and cooperating State apprenticeship agencies provide consultant service available to you on request.

Specifically, they will . . .

- Assist in determining your training needs
- Furnish information on training aids, programs, and materials
- Assist, where necessary, in planning training activities to meet specific needs

If additional information on apprenticeship and training is desired, contact the Bureau of Apprenticeship Training official in your region listed below:

CAREER PLANNING, *OCCUPATIONAL GUIDANCE, *YOUTH PROGRAMS, *COMMUNITY INVOLVEMENT, GUIDANCE PROGRAMS, *PROGRAM DESCRIPTIONS, SCHOOL INDUSTRY RELATIONSHIP
EVERETT, MASSACHUSETTS

The "Everett Plan," nicknamed the Everett Prep Club, is a voluntary, action-oriented, youth-centered program of planned extra-curricular activities open to high school age youth which helps in preparing them to make the transition to the world of work. The program was introduced, developed, and coordinated by the Everett Massachusetts Chamber of Commerce as a total community project and is directed by a 21-member advisory council representing many segments of the community. It is financed and administered by the business community with individual firms sponsoring individual Prep Clubs. The program operates as an association of different occupational interest groups with a common pattern of activity. Prep clubs meet twice a month in the evening under the direction of a volunteer adult leader from sponsoring firms with youth officers presiding at all meetings. Some of the club activities are field trips, films, speakers, and social events. Club members benefit by gaining personal and business knowledge and understanding, getting experience in self-analysis and career and job exploration, associating with peers and adults conpetent in many areas, and developing personal plans. Documents treating other business training and retraining programs are available as VT 003 414-VT 003 427. (MM)

Career Guidance for Youth, AN ANSWER TO TRAINING NEEDS OF BUSINESS.

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE
OFFICE OF EDUCATION
THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

The jobless rate among youth is two to three times that of the rest of the population. The heart of the unemployment problem is the uneducated and unskilled who are not wanted for jobs. Jobs for the skilled and educated are plentiful. There are answers to the problem of youth unemployment. The answers involve programs, such as those sponsored by the Chamber of Commerce of the United States to prevent high school dropouts. These include improvement in local vocational training and retraining programs, close cooperation between schools and businesses so youths are taught skills that are needed in business, and better apprentice training.

Pilot Study Offers a Solution

A pilot study (called the EVERETT PLAN) sponsored by the Everett, Massachusetts, Chamber of Commerce working in collaboration with the Center for Continuing Education of Northeastern University and the Massachusetts Department of Labor and Industries, Division of Apprentice Training, has been completed. An annual program is now in effect which is utilizing pilot study findings to bring community resources to bear on this problem.

Early Career Planning a Must

Selecting the right career and the way to earn one's living probably is the most important decision a person makes in his entire lifetime. Therefore, it is essential that career interests and personal goals be set early so that they can serve as guidelines in determining the kind and amount of education to plan for.

Delays in making such an important decision makes education or training more difficult to obtain, and valuable years of productivity and personal development are wasted, both to the individual and the nation's economy.

Authorities agree that much of the frustration encountered by youth in the transition from school to work could be eliminated, job turnovers reduced and the gap, averaging six years between high school graduation and continuing education, could be narrowed by adequate guidance and proper career planning.

Despite vast strides forward in guidance and career planning in recent years, the need of America's youth has not been met and this gave impetus to the birth of "The Everett Plan for Preparation for Employment."

What is the Everett Plan?

The Everett Plan which has been nicknamed the "Everett Prep Club" by members is a voluntary, action-oriented, youth-centered program of planned, extracurricular activities open to boys and girls of high school age, regardless of race, color, creed, or school affiliation, including those who have discontinued their attendance at high school prior to graduation.

The project is designed to aid Club members in preparing themselves to make the transition to the world of work; to select the kind of work that is suited to their needs, interests and qualifications; and to find a satisfactory starting point for continuing progress, growth and achievement.

While the program provides benefits for college-bound youth, it is primarily aimed at the approximately 70 percent of high school students who plan to enter the work force after graduation and at those youths who have dropped out of school.

The program brings to bear the total resources of the community to resolve a problem that is national in scope.

At work on the construction of a mock-up of a Mercury space capsule for the National Aeronautics and Space Administration in the Everett plant of the United Industries, Incorporated, are members of the woodworking Prep Club who have afternoon jobs at this plant. L. to R. are James E. Butler, Roy E. Whitson and Peter Amato, company president and chairman of the Chamber Prep Club Advisory Council.

VT003416

Why the Everett Plan?

In these rapidly changing times, technological advances have resulted in the elimination of many laborious and unskilled jobs and have created many new jobs and career opportunities calling for a higher level of education, skill, and training. The indications are that, in the years ahead, a much larger number of boys and girls will be graduating from our high schools and seeking employment in business and industry.

Most of these young people are unfamiliar with the realities of the world of work, with the opportunities available to them, with the requirements and responsibilities which employment will place on them, and with the abilities, skills, and personal habits and attitudes they will be called on to develop.

While much help is available through the school system and through parents and friends, study shows there is a real need for a better planned, organized and continuing approach during the years prior to entering the work force to assure early and satisfying jobs for our nation's youth.

Prep Club Goals

1. To prepare youth for the transition from school to work;
2. To reduce school dropouts;
3. To assist school dropouts in advancing their career interests;
4. To help terminal high school students to find early and satisfying employment;
5. To increase the flow of youth to formal apprentice training programs;
6. To elevate the dignity of all useful occupations;
7. To motivate youth to pursue advanced education and training;
8. To assist youth in selecting a satisfying and rewarding career;
9. To place a new and greater emphasis on a successful high school career;
10. To assist youth in setting personal goals;
11. To assist youth in identifying the elements of life planning that contribute to success, continued growth, and happiness;
12. To advance the understanding of youth in the value of our free enterprise system.

What About the Future?

While the present program is for youth of the 12th grade age level, the ultimate goal of the Chamber's Prep Club Advisory Council is to introduce a similar program in the 9th grade through the 12th grade with an appropriate program for each grade level.

Loretta J. Altieri, President of the Graphic Arts Prep Club, tries her hand at opaquing a negative at the Acme Printing Company in Everett, with Robert K. McCabe, a club member, looking on during a recent field trip. To the right is William Prianti, Company executive and club leader.

Studies show that it is in the lower grades that the dropout problem can best be resolved.

How Does the Program Operate?

The program operates as an association of different occupational interest groups and functions within a common pattern of activity and towards the same general objectives to accomplish Prep Club goals.

All Prep Clubs meet twice a month during the school year at the same time in the evening under the direction of competent adult leaders from sponsoring firms. Each individual club has its own youth officers who preside at all meetings. Several joint meetings feature keynote speakers prior to individual club meetings. At other meetings films and visual aids are used, panel discussions are arranged, and field trips to various firms are made. Leaders are provided manuals covering subjects and methods of conducting meetings. Each member is issued a guide which includes career information, aptitude tests, job analysis work sheets, hints on personal development, job surveys, etc.

Sessions cover: Establishing Personal Goals, Career Planning, How a Business Operates, Where and How to Find Employment, Business Understanding, Labor-Management Relations, Career Opportunities, The Job Interview, Government's Role in our Economy, Economic Understanding, Evaluating Opportunities, Selling One's Self, and other subjects.

Who Operates the Program?

The Everett Chamber of Commerce introduced, developed and coordinates the program. Administration is provided by the Chamber staff. The operation of the project is directed by the Chamber's twenty-one member advisory council which includes representatives of management, labor, government, schools, clergy and other segments of the community. The council approves occupational interest groups, sponsoring firms, program contents, meeting sites, frequency of meetings, arranges for finances, and provides general direction for the successful operation of the program.

How is it Financed?

The program is financed and administered by the business community through its Chamber of Commerce Advisory Council. Firms sponsoring individual Prep Clubs assume miscellaneous expenses in connection with field trips and other activities. Club leaders serve on a voluntary basis.

How Does Youth Benefit?

Club Members

develop new knowledge and understanding of:

—Our business system and how business operates
—Personal goals and career planning
—Self-development suited to their needs, interests and qualifications

get experience in:

—Self-analysis of their experiences, educational interests, and abilities
—Career and job exploration
—Individual and group work projects
—Effective presentation of ideas and information to others
—Working with others
—Preparing applications for employment
—Participating in job interviews
—Selling one's self

"Pick the brains" of:

—Club leaders
—Fellow club members
—Guest speakers
—Competent individuals in management, labor, government, and education

find out new sources of information which will aid in personal planning, in career and job exploration, and in finding employment—so that they will know where to look and who to see

develop personal plans for further education, self-development, and eventual employment.

Meetings Not All Work

Occasionally planned social affairs are included as part of Prep Club activities and are held following club meetings.

Not to be overlooked is the "Prep Club News" which is prepared by the Clubs' news staff and published twice monthly to keep members informed on club affairs and activities of club members.

Sponsoring Firms Play a Big Part

In addition to providing leaders for individual Prep Clubs and serving as members of the advisory council, sponsoring firms assume miscellaneous expenses in connection with club activities. They also make valuable contributions as to the kind of information to be included in Prep Club sessions. In-plant meetings are often held with the firm's Prep Club leaders to assist them in their voluntary post and to advance the effectiveness of the program.

In numerous cases sponsoring firms have hired Prep Club members for work after school hours and some are slated for full-time employment and training after graduation. This is not a prerequisite of a sponsoring firm, however.

How our business system operates was the topic of discussion by Prep Club members with company executives at the Everett General Electric plant following plant visit. Paul N. Martin, club leader, is standing to the left. Seated at the head of table are company panel members.

A Working Partnership

The Prep Club program is not a substitute for present school guidance activities; it is designed, however, to complement the valuable work guidance counselors are currently doing in the vital area of career planning.

An Everett Prep Club reporter asked a guidance counselor of the Everett Public Schools the following question: "Do you think the Everett Prep Club is interfering with the work of the Guidance Department?" He answered: "No, I don't. The Everett Prep Club can be a supplementary asset to the work of the Guidance Department. Just by meeting people in industry and business, being exposed to their ideas can contribute tremendously in the students' problems of choosing a career." The Guidance Director, incidentally, is a valuable member of the Chamber Prep Club advisory council, as are the superintendent of schools and the principals of the local senior and vocational high schools.

John J. Cronin, left, Prep Club leader explains mechanical devices to club members during a field trip to Monsanto Chemical Company's Everett plant. L. to R. are: Silvio Albano, Robert Vesperini, Joseph Harrington and Allan Johnson.

The Role of Club Leaders

Leaders of individual Prep Clubs are the backbone of the fledgling new youth program. They regularly attend club meetings, set up field trips, collaborate with club officers in the conduct of meetings, provide visual aids, arrange for panelists for club sessions when required, motivate members to maximum participation in club affairs, and serve as advisors to club members.

Leaders meet regularly to discuss club sessions and swap tips on successful methods of leadership.

Leaders include both men and women and come from the top echelon of local firms and organizations.

At the present time, twenty-nine leaders are serving fourteen individual Prep Clubs that were established to advance the career interests of the two hundred enrolled club members.

A Solid Program

It took ten months of advanced planning and research before the pilot study was introduced in May, 1962. Five additional months of work were devoted to analyzing the evaluation of the pilot study and to further program planning before the full year's program was presented to Everett youth in October, 1962.

A continuing evaluation of club members, leaders, and sponsors is an important part of the current program and will prove valuable in keeping the project in tune with the career interests of members, changes in the demand for various types of work, new training techniques, educational needs, and changes in the nation's economy.

The Center for Continuing Education of Northeastern University in Boston conducted the research studies, prepared evaluation procedures, and developed the contents of the program in collaboration with the Chamber, school authorities, sponsoring firms, and State and Federal agencies.

How Will the Nation's Economy Benefit?

- A reduction in youth unemployment will ensue.
- The number of school dropouts will be reduced.
- More youth will pursue formal apprentice training to fill the increased demand for skilled craftsmen.
- The waste of valuable human resources will be reduced.
- A more knowledgeable work force better prepared to accept and cope with technological changes will be provided.
- More youth will be motivated to seek advanced training and education.
- The number of job turnovers will be reduced.
- America's youth will be better prepared to find earlier and satisfying employment.
- The program will produce better citizens, more knowledgeable, as it relates to our free enterprise system and how our economy operates.
- A new meaning will be placed on the value of all useful occupations.
- Our youth will be better adjusted and happier workers.
- A closer working relationship will be established between youth who represent our future manpower resources, school authorities, guidance directors, the business world, other community segments and government agencies.

MF AVAILABLE IN VT-ERIC SET.
Pub Date - 28Jun63 4p.

*ON THE JOB TRAINING; *INDUSTRIAL TRAINING; MANPOWER DEVELOPMENT; ADULT VOCATIONAL EDUCATION; *PROGRAM DESCRIPTIONS

On-the-job training combines instruction with work experience to insure that the employee acquires better management of production skills. In 1962 more than 2½ million employees were given some type of formal training in programs sponsored by their employers or joint labor-management arrangements. These programs were developed, supervised, and administered by employment managers, training directors, or supervisors. Supervisory training on how to instruct is essential to accomplish desired goals. Public and private agencies also provide business with up-to-date services for their training needs. The Manpower Development and Training Act of 1962 has special provisions for on-the-job training programs to be implemented by the Bureau of Apprenticeship and Training, U.S. Department of Labor. By 1970, the 58 million now at work will have 26 million young workers and three million women who have switched from housework to jobs added to the labor force to make a total of 87 million Americans working full time. On-the-job training can help both individuals and businesses to meet manpower needs. Documents treating other business training and retraining programs are available as VT 003 414-VT 003 427. (MM)

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

On-the-Job Training

AN ANSWER TO TRAINING NEEDS OF BUSINESS

What is On-The-Job Training?

A method of training, which combines instruction with work experience to see that an employee acquires better management of production skills, is called On-The-Job Training. The exact length of a training period will vary depending on the skills taught.

EDITOR'S NOTE: This is the fourth in a series of Special Supplements on training and retraining programs utilized by business firms. This article, "On-The-Job Training," is a companion piece to the one on "Apprenticeship." Previous *Washington Report* supplements: "Accredited Correspondence Education," November 30, 1962; "Apprenticeship," February 8, 1963; and "Career Guidance for Youth," April 12, 1963, were received enthusiastically by business. If you missed any one or all of these supplements, you may obtain complimentary copies upon request to the National Chamber. A fifth in this series will feature "Vocational Education: Trade Extension Training" and will be printed in a later issue of *Washington Report*.

Why On-The-Job Training?

On-the-job training is a program with a definite purpose. It is an action plan whereby businessmen offer their employees the opportunity to develop skills. This type of training—learning while doing—provides common interest goals between the employer and the employee. Common interest goals encourage people to be better informed, more productive, and more responsible citizens. Business and industry have long accepted the fact that there is a direct relationship between the development of their product and the development of the people who do the work.

Most employees have that quality which is conducive to American progress—a natural desire to advance in their work. Employers can do much to stimulate mutually helpful training opportunities for employees. Self-improvement goes hand in hand with management skills and production goals. For a successful enterprise, there should be a mutual appreciation and concern for management and production goals. On-the-job training improves the overall social and economic position of the employer, the employee, and the community.

U. S. Labor Department Official Lauds Efforts of Business

"Trade associations and chambers of commerce have demonstrated a real interest in helping in this area of manpower development," stated John Shouligian of the Office of Industry Promotion of the Bureau of Apprenticeship & Training. "Since your Supplement on 'Apprenticeship' the activities of our 12 Regional offices have definitely increased." He further stated, "We want to assist business in every way possible to establish Apprenticeship and On-The-Job Training programs. Our field staffs in every state are making personal calls on businessmen daily to assist in organizing training activities."

"Whenever a chamber of commerce or trade association invites one of these BAT representatives to talk to a large group of plant and store owners, it multiplies the effectiveness of each Apprenticeship and Training representative and gives every taxpayer a better return on the funds appropriated to finance BAT."

Department head Jim Kistler instructs Evelyn Custer in the really fine points of micro welding. Working under a microscope, Evelyn is welding wires on the chassis of a miniature hearing aid marketed by the Maico Electronics Company, Inc., of Minneapolis. The Maico Co. is one of the pioneers in the hearing aid field and has utilized on-the-job training at all levels from production to sales.

VT003417

Where Does On-The-Job Training Apply?

On-the-job training is not limited to any single business or profession. A medical intern receives on-the-job training, so do literally thousands of other people in all industries.

A survey by the Bureau of Apprenticeship and Training of the U. S. Department of Labor shows that, in the spring 1962, more than 2½ million employees in American industry were being given some type of formal training in programs sponsored by their employers or through joint labor-management arrangements. Almost half of these workers—about 1¼ million—were employed by large firms with 500 or more employees. Manufacturing firms alone accounted for more than 1 million of the worker-trainees, followed next by retail trade establishments which were training well over ½ million. (See chart below.)

"It's like this," explains Fred Davey, instructor at Tektronix, Inc. to future field engineers and field maintenance engineers who are receiving their technical on-the-job training. "Eight months of intensive training, using up-to-date teaching aids, gives each candidate a thorough understanding of Tektronix oscilloscopes and accessories and prepares him for permanent assignment in any of Tek's field offices." Founded in January, 1946, Tektronix, Inc. of Beaverton, Oregon, has grown from the five original employees to approximately 5,000 people, with 39 field offices throughout the United States and Canada.

To Whom Does it Apply?

All types of employed persons, from the managerial level to employees at the work site, participate in on-the-job training programs. The following classifications are most common:

- **Supervisors**
- **Engineers**
- **Technicians**
- **Journeymen**
- **Apprentices**
- **Semiskilled operators**
- **Co-op students**
- **Clerks**

DISTRIBUTION OF TRAINEES IN FORMAL TRAINING BY INDUSTRY

Source: Mildred Barber, Chief, Division of Research, Bureau of Apprenticeship and Training, U. S. Department of Labor.

Every type of occupation requires skills. The properly trained person possesses the aptitude for his occupation. He has the knowledge of and competency for performing all phases of his work.

Identifying Employee Training Needs

Many companies have set up functions that help employees develop skills through on-the-job training. Various methods are used to identify training needs of the employee, such as:

- **Testing**
- **Individual counseling, etc.**

Who Does the Training?

Not too many years ago, owners and operators of business and industry not only operated and managed their business but also trained their employees. Now, because of the diverse demands of the company owner or official, on-the-job training programs are developed, supervised, and administered by employment managers, training directors, or supervisors. Today, public and private agencies provide business and industry with up-to-date services for their training needs.

Norman Childs, left, is instructing Walter Pepper, in techniques of tool sharpening at the Comolli Granite Co., Elberton, Ga. Mr. Pepper not only completed his training as a tool sharpener, but has become one of the Elberton area's most skilled workmen as a cutter and carver.

Instructor, Mrs. Katherine Phillips, of the Jantzen Knitting Mills of Portland, Oregon, explains to beginning trainee Eleanor Gardner proper method of Power Sewing Machine operation. (Upper left) Eleanor Noland, advanced trainee. This "in-plant" training program was started for all production workers and a large portion of the clerical and supervisory staff in 1943, and since that time all beginning employees have been trained through this program. Training is of six weeks average duration and is conducted during working hours and on company time.

Business and industry employ specialists who develop training programs and transfer skills as well as knowledge to employees on and off the job. Many companies which do not require a full-time trainer arrange for private or public assistance. Various management associations pool their resources toward acquiring professional trainers.

What Type of Training is Provided?

- **Management**
- **Supervisory**
- **Production**
- **Apprenticeship**
- **Safety**
- **Sales**

Do You Need a Trainer?

Many large companies employ a specialist who does the training. In smaller firms, supervisors who have the responsibility for training often delegate training functions to a journeyman, skilled operator, technician, etc.

Today, line supervisors are often required to instruct new and old employees working under them. As a result, supervisory training on how to instruct is essential to accomplish desired goals.

Benefits that Accrue

Business and industry stress the importance of recognizing and guarding human values in today's world of technological advance and material progress.

More leaders of business and industry are taking time out from their many chores to participate in training programs which promote self-reliance and initiative among their employees.

Their specific objectives for participating in such activities are to keep business and industry dynamic and expanding, and to create new job opportunities.

Employee "team training" pays off in garment plant. Pattern maker Jean La Bore, left, and designer Don Purdy examine a pattern problem, as Mrs. Jules Gurstel checks the result. Mrs. Gurstel, in partnership with her husband, Jules, is owner of "Juliette Originals" at St. Paul, Minnesota. Her successful efforts in "in-plant training" have led to broader activity in women's clubs and civic circles to promote industrial recognition of training responsibility.

Business and Industry Need Flexibility In:

- Meeting demands
- Work force
- Skill requirements
- Training programs
- Sales approach

On-the-job training programs of business and industry usually are influenced by:

- Competition
- Expansion
- Diversification
- Demand
- Quality Control

The Manpower Development and Training Act of 1962

Congress included in the Manpower Development and Training Act of 1962 specific provisions for on-the-job type training programs throughout the country. This Act establishes a nationwide program for both institutional and on-the-job training to meet current and future occupational demands.

The Bureau of Apprenticeship and Training, U. S. Department of Labor, has the responsibility for implementing the on-the-job training features of this Act. Assistance is available to employers and other organizations to set up training programs and, in some instances, funds to defray training costs. There are provisions for trainer salaries, consumable supplies, and other allowable costs. Employers should contact the Bureau of Apprenticeship and Training Office in their vicinity for specific details.

By 1970, Eighty-seven Million Americans will be Working Full-Time

58 MILLION
Now at Work Will Still be Employed

They need training to keep pace with new methods, new materials, new opportunities. Many will require retraining as their jobs disappear due to automation and economic change.

26 MILLION
Young Workers Will Start Work, 1960-70

Their aptitudes, skills and education must match the needs of a changing economy. The eight out of ten who will not complete college must gain occupational competence in other ways.

3 MILLION
Women Will Switch From Housework To Jobs, 1960-70

These wives, mothers and widows will need marketable skills in the decade ahead.

On-the-job training will not only help the individual but will assist businesses of all sizes in meeting the manpower needs of a changing economy.

Vocational Education--Upgrading Adult Skills, An Answer to Training Needs of Business. Washington Report, Special Supplement; August 2, 1963.

Chamber of Commerce of the United States, Washington, D.C.
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 2Aug63 8p.

*TRADE AND INDUSTRIAL EDUCATION; *ADULT VOCATIONAL EDUCATION; *EXTENSION EDUCATION; SCHOOL INDUSTRY RELATIONSHIP; *PROGRAM DESCRIPTIONS

Trade and industrial education programs for upgrading adult skills operated under a plan that involves a working relationship between local, state, and federal governments. Approximately 70 percent of the more than one million enrollees in trade and industrial education are adults or youth who have left the full-time schools. If the vocational schools are to serve the needs of workers who need updating, upgrading, and lifelong learning to cope with the challenge of an era of change, they must have (1) a skilled vocational administrator, (2) equipment and facilities to extend vocational opportunities, (3) industrial and business leaders who know their needs and the needs of the citizens, (4) periodic evaluation of the program by experts in the training field, industrialists, businessmen, personnel workers, and analysts, (5) trade teachers who have an excellent standing in their craft and training in the techniques of instruction, (6) advisory groups and craft committees, and (7) a flexible program and schedules to fit the needs of people. Employers, associations, unions, and private citizens working together with local school officials can develop more courses that help to keep the skilled work force operating at a high level of production. A directory of all state supervisors of trade and industrial education is included. Documents treating other areas of business training and retraining programs are available as VT 003 414-VT 003 427. Vocational Education: Upgrading Adult Skills

AN ANSWER TO TRAINING NEEDS OF BUSINESS

Need Will Grow to Upgrade Adult Skills

As the labor force expands during the 1960's and as demands increase for highly skilled manpower, the need for more classroom instruction to upgrade skills will also increase.

Expansion of the labor force is indicated by the following estimates:*

- In five years 87 million persons will be working full time the year around.
- 26 million of these workers will have entered the labor force during the last ten years.
- By 1970 those working or seeking work will total 100 million persons.

EDITOR'S NOTE: This is the fifth in a series of Special Supplements on training and retraining programs utilized by business firms. Previous *Washington Report* supplements cover "Accredited Correspondence Education," November 30, 1962; "Apprenticeship," February 8, 1963; "Career Guidance for Youth," April 12, 1963 and "On-the-Job Training," June 28, 1963. All five supplements have been combined in a *Manpower Development and Training Kit* which may be obtained from the Education Department of the National Chamber. (Single kits free.)

Vocational educators as a group are aware of the fact that their programs must provide training for the millions of workers whose skills and technical knowledge must be updated. They recognize that adequate training courses must be available for those whose jobs will disappear because of increased efficiency, automation, and changed economic conditions.

These educators are alert to the fact that the traditional methods of developing skilled craftsmen are not providing adequate numbers of replacements for those who leave the labor force due to normal attrition, and that many present-day workers will need updating and upgrading courses to extend their skill and knowledge.

**Education for a Changing World of Work—Report of the Panel of Consultants on Vocational Education, U. S. Department of Health, Education, and Welfare, Office of Education, U. S. Government Printing Office, Washington, 1963. OE-80021.*

Many vocational programs are operating under a local school administrator—usually a local superintendent of schools—who may not be fully aware of the needs of industry and the business community. Frequently, the superintendent of schools has many problems which appear more pressing than those of the adult population that left his schools as "finished" graduates some years before.

A Skilled Vocational Administrator is Important

If vocational schools are to serve the needs of workers who need updating, upgrading and lifelong learning to cope with the challenge of an era of changing materials, processes, tools, and techniques, then a local vocational school administrator should be available with time to devote to such activity and the "know-how" that will permit him to successfully carry out his assignment.

The employer with the carefully attuned ear can tell when he is in friendly territory with an industrially oriented administrator. The well oriented administrator

The Bullard-Havens Technical School offers many varied opportunities to the citizens in and around Bridgeport, Conn. Mr. Stephen Filakosky, at left, is instructing Mr. C. Miles (right front) in various techniques of using basic machine tools. Mr. R. Zdrodowski is seen working at right rear. Students enrolled at Bullard-Havens Technical School come from many types of industries in the area.

VT003418

will come up with such terms as "instructor, group, learner, trainee, apprentice," and the like. This person is likely to have an excellent knowledge of the needs of employer and employee alike. He will be more knowledgeable about the facilities needed to do a suitable training job. Qualifications of local administrators should include an excellent educational background, several years occupational experience at the journeyman or supervisory level, teacher training courses in the field of vocational education, and teaching or similar experiences.

The business community recognizes the importance of dealing with a skilled administrator who understands community training needs. Industry understands the importance of skill in job analysis, curriculum development, foreman and supervisory training, labor-management relationships, teacher training, working advisory groups and a host of other phases of vocational extension training that only a well-trained local director possesses.* The local vocational education director best suited for the job should have had substantial work experience in business and industry, a good educational background, and proved himself as a vocational teacher. With this background the vocational school director should have the answer to many of industry's needs for suitable courses, facilities, and teachers to do the job of keeping the work force abreast of the changing world of work.

Where does one find such an administrator? It is to be admitted that they are becoming more and more difficult to find. However, in Wisconsin, Connecticut, Georgia, North Carolina, and California they appear frequently. Many other states like Kentucky, Ohio, Louisiana, New Jersey,† Colorado, and Texas have splendid programs headed by skillful local administrators who are well-oriented to the needs of their industrial and business communities.

Many states face up to this challenge and one state does it rather uniquely. Wisconsin provides for a local director of vocational education in every community of 5000 population or over.‡

**Determining Requirements for Development of Technical Abilities Through Extension Courses. U. S. Department of Health, Education, and Welfare, Office of Education, U. S. Government Printing Office, Washington, 1961. OE-80010.*

†1961 Annual Report, Vocational Division, New Jersey State Department of Education, Trenton, New Jersey.

‡Fifty Years of Continuous Growth in Education—Madison Vocational Technical and Adult School, Madison, Wisconsin.

See also, Opportunity Through Education In Wisconsin Schools of Vocational-Technical and Adult Education. C. L. Greiber, Director, State Board of Vocational and Adult Education.

The smiles on the faces of the students in Machine Shop illustrate that learning can be fun. Many men and women in and around Chippewa Falls, Wisconsin, benefit from the evening extension classes offered by their school system.

A local director trained in the administration of vocational education programs can keep training in balance with the needs of the community.

Facilities Help Training

Schools sometimes put forth every effort to meet the needs of day school enrollees. Where such is the case one will hear much talk about the comprehensive high school. While some high schools may be truly comprehensive in nature, too often a comprehensive high school is one with a few shop offerings superimposed upon a predominantly academically oriented curriculum. It is obvious that such a school, while it may meet the needs of the college preparatory students, may be poorly adapted to meet the extension training needs of business and industry.

Equipment and facilities must be provided to extend vocational education opportunities to many more workers, especially those living in communities where training is a critical need. Training opportunities should be expanded by mutual action of business and industry, employers and union groups. A trained vocational school director can provide the leadership needed to keep the expansion in harmony with needs.

The area-type vocational school is coming into its own because of the services these facilities can render the industrial and business community and citizens in general. The area school should serve a sufficiently large geographical area to spread the costs over a broad tax base. This larger area should make training opportunities available to more citizens than the traditional high school. With greater resources, the area school can provide training in a greater variety of fields of work than would otherwise be the case. The area school should operate around the calendar where needed, and should operate any time, day or night, to better meet the needs of its patrons. Educational facilities, including shops and laboratories, should be provided in such schools in keeping with the expressed need of industry, as suggested by an advisory committee.*

The area vocational school with its occupationally oriented administrator should be well aware of the needs of the industries within its service sphere. Such a school often has an industrial coordinator who makes periodic calls on the business houses and the plants it serves. This coordinator should have responsibility for meeting periodically with advisory groups. He should keep in close contact with several comprehensive high schools that serve as satellites to the area school. The successful school is the one geared to the needs of the people of the area it serves including representatives of the business community, government, associations, unions, and other groups.

A Joint Working Relationship Exists

Vocational schools operate under a plan that involves a working relationship between local, state and the federal governments. In general, state and local expenditures far exceed the matching requirements of the several federal vocational education acts. Local communities are generally spending $117 million, states $89 million, and the federal government $48 million on vocational education.

Approximately 70 percent of the more than one million enrollees in Trade and Industrial Education are adults or youth who had left the full-time schools.

The Report of the Panel of Consultants on Vocational Education states: "Education for occupational competency is a lifelong process that starts when one acquires his first basic skills and concepts and ends when he quits his last job. Much of the competency for occupational life is acquired outside the formal educational program, but for many individuals there is need for organized vocational education at successive stages. The need for new skills is especially great in an economy which is undergoing rapid technological change, as at present." * Many kinds of training are available to the citizen and the business community. The quality varies widely and the objectives of the training differ.

The three students at the left are paying close attention to Mr. Theodore Woolsey, instructor of Metallurgy. Expensive, up-to-date equipment is required to teach such courses, and the Los Angeles Trade-Technical College, Los Angeles, Calif., has such equipment available.

Participation in Community Service

Good vocational education is no accident. It exists where industrial and business leaders know their needs and the needs of the citizens of the community and take an active part in translating known needs into an action program. If adult training is an economic asset in the community—and practice has demonstrated that it is—then high quality programs should be established, maintained and supported.

To maintain a high level of quality of instruction to meet changing community needs, it has been found that a periodic evaluation of the program should be made. This evaluation should be done by experts in the training field. Included on an evaluation team should be industrialists, businessmen, personnel workers, analysts and others.

Students of the Technical High School in Fort Worth, Texas, are adjusting tappets and throttle control on a Bosch Fuel System. They are profiting by the up-to-date, modern equipment of the Diesel Mechanics Department.

The businessman should find himself involved in many activities associated with the vocational school in his area. He can be of service—and he, in turn, will receive the best service—when he participates in one or more of the following school activities as a member of a:

- local school board
- board of vocational education
- local advisory group
- joint apprenticeship council
- committee on vocational education of the service organization

Through active participation one can keep abreast of vocational education developments and understand better the needs of the adults of the community. The active participation in school affairs of citizens who understand the business community will do much to keep local school curricula in line with current needs. When this participation is lacking, an academic imbalance may result in the preparation of a disproportionate number of youth and adults for occupational areas in which their chances of success are small.

Vocational education programs can be enriched through participation in community activities by business leaders with a knowledge of the program. Such leaders should become knowledgeable about the extension training program, understanding not only the objectives but the elements necessary to its success.

Identifying Vocational Education

The term "vocational education" used correctly identifies a specific area of education. Vocational education provides training in the fields of trades and industry, distribution and marketing, homemaking, manpower development, technical and agricultural fields.

Recent manpower development activity, automation, training and retraining have given added emphasis to the fact that vocational education is an important and vital force in the economic growth of the nation. Consequently, the business community and citizens in general should know how to identify effective vocational instruction.

The title of a course alone is not a reliable guide for recognizing vocational training. Genuine vocational instruction meets the following criteria:

It provides training to develop the abilities, skills, understandings, and attitudes needed by a worker in an occupation.

It is of greater value to a worker in his occupation than to a worker not in the occupation.

It is of value to all workers in the same occupation on the level for which training is given.

Trade and Industrial Education Objectives

Trade and Industrial Education has as its major objectives:

To increase the performance skills, including those relating to safety, and technical knowledge of persons already employed in trades and industry, through extension or supplemental courses which will develop their job judgment and give them related industrial information.

To develop basic manipulative skills and knowledge that will enable persons to get jobs in trades and industry.

These objectives are accomplished through a variety of programs in schools having many names. Among the groups served by these schools are journeymen, technicians, apprentices, in-school youth and adults, and out-of-school trainees, including industrial workers.

There are many opportunities for employment in the various service fields today. The men pictured above have been out of school for a number of years, but are learning appliance repair skills at the Emily Griffith Opportunity School in Denver, Colo.

Trade Extension Training

In the United States there are more than 565,000 persons enrolled in trade extension courses. Representative craft, occupational, or industrial advisory groups work with local school administrators and the employment service in identifying occupational areas in which training should be offered. In addition, school administrators call upon advisory groups when analyzing occupations, setting up curricula, equipping shops, laboratories, and training facilities.

Trade extension courses provide instruction which supplements the experience gained on the job in various occupations. An industrial employer, a trade union, a trade association, or a group of workers may request a local vocational-technical school to conduct extension training courses.

Who Teaches Extension Courses?

Requirements set forth in State Plans for Vocational Education stipulate that trade extension teachers in reimbursed programs shall have an excellent standing in their craft. This standing is obtained through demonstrated skill and experience as a journeyman prior to teaching in a vocational or technical school.

Departments of Vocational Education in the states supervise courses offered in local schools. Teacher training is provided craftsmen who come into teaching from a trade or occupation.* This instruction in the techniques of teaching adults is usually given by an expert called a teacher-trainer. Trade extension instruction of recognized quality is the goal of vocational courses for today's journeymen, craftsmen or industrial workers.

Instructors are employees of the local public school system in most instances. Several states, however, have a system of state-operated vocational schools. In these special instances the teacher is a state employee.

**Teacher Competencies in Trade and Industrial Education—U. S. Department of Health, Education, and Welfare, Office of Education, U. S. Government Printing Office, Washington, 1960. OE-84006.*

Qualification standards for all teachers, set forth in the State Plan for Vocational Education, apply uniformly throughout a state. While advisory groups and craft committees often suggest the name of prospective instructors, the hiring, supervision, and discharging of teachers is a prerogative of the local board of vocational education or its representative. In the case of a state operated program, the appropriate state official is the employing agent.

A program supported with public tax funds must be under public supervision and control.

Post-high school boys from Madison, Wisconsin, are attending a class in Civil Engineering Aid Technology. The course is approved by the State Highway Department.

Opportunities for Participation

Trade extension courses for men and women should be reaching far more people than is the case at present. More communities should be providing training in the evening or after working hours to help individuals keep abreast of the changing technology. Retraining and updating must go on continually if workers are to keep up with changes occurring in occupations. A wide variety of courses is available in such areas as automotive, building trades, drafting, electronics, graphics, machine and metal trades, photography, service trades and welding. Opportunity does not end with employment. Trade extension programs provide the setting for employees to grow within their chosen field to the peak of their capability.

More employed workers are in need of information and knowledge related to their jobs than in need of additional skills. Classrooms and laboratories usually are more readily available than shop facilities. Technological developments occurring at an accelerated pace provide the schools with an opportunity to render invaluable services to the business community through making available needed courses in work-related subjects.

Extension courses can operate any time, day or night. The length of a session may vary from one to four hours. There is great latitude in scheduling. A short, intensive course may operate for only one eight-hour day, or it could operate two hours per night, one or more nights per week. A typical evening school

The picture above could have been taken at any large restaurant or hotel kitchen in the country. It wasn't—the chef at left is an instructor at the Emily Griffith Opportunity School in Denver, Colo. This school is supported through a special levy which the citizens of Denver have found to be a very worthwhile investment in their future.

schedule provides 40 or more weeks of instruction, usually no more than two nights per week of two or three hours per night. Short units of 20 or 40 hours have been found to be more attractive than longer units. Schools frequently issue a certificate for each short unit course. Men and women look forward to receiving a certificate of recognition upon completion of a course.*

Small enrollment fees are customarily charged. They may amount to no more than a small charge to help defray the cost of bookkeeping for the school. Some shop and laboratory courses consume large

---

**Administration of Vocational Education—Rules and Regulations*—*U. S. Department of Health, Education, and Welfare, Office of Education, Government Printing Office, Washington, 1958. Bulletin No. 1, General Series No. 1. OE-80017*

quantities of supplies or involve the use of expensive equipment, making it necessary for the school to seek assistance in defraying these higher costs. The size of the fee is a local matter and is not a requirement of state or federal statutes. In fact, student fees may not be used to match federal funds in reimbursed vocational educational classes.

Are Classes Available in Your Community?

Trade extension classes are available in many communities throughout the nation. The office of the local superintendent of schools should have information about training opportunities available in the community. A letter of inquiry addressed to the "State Supervisor of Trade and Industrial Education" in the state capital should bring information about the location of courses or the availability of state and federal funds to assist in the financing of extension courses for industrial workers. The Trade and Industrial Education Branch of the U. S. Office of Education has prepared a listing of schools that offer vocational-technical courses for high school youth and adults.*

The Welding Department of the Technical High School in Fort Worth, Texas, is equipped with the type of tools found in industry. The student above is practicing Tungsten Inert Gas Shielding on Electric Welding of Stainless Steel.

**Preparatory Trade and Industrial Training Programs in Public Schools, A Directory: 1961-62. U. S. Department of Health, Education, and Welfare, Office of Education, U. S. Government Printing Office, Washington, 1962. OE-84028-62.*

It takes many types of vocational-technical courses to prepare individuals for the world of work. Pictured above are students in commercial art enrolled at the Los Angeles Trade-Technical College. Mr. William Beynon, standing in the rear of the room, is the instructor of this popular course.

Evening courses continue to attract large numbers of workers who enroll in trade extension courses to help their advancement on the job and to become better acquainted with the newest technological developments in their occupation. The earning power of enrollees frequently is increased as a result of the effort put forth in courses of this kind that operate in the evening or after working hours. Participation in courses that extend the skill, knowledge, and attitudes of workers has proved to be a wise investment for employees and employers alike.

Summary

Vocational trade extension training is provided by the public schools. In some states additional state appropriations are needed to match local tax monies to provide quality instruction helpful in updating training, and retraining employed men and women. Employers, associations, unions, and private citizens working together with local school officials can develop even more courses helpful in keeping the skilled work force operating at a high level of productive activity.

*WORK STUDY PROGRAMS; *COOPERATIVE EDUCATION; *VOCATIONAL EDUCATION; HIGH SCHOOLS; POST SECONDARY EDUCATION; *PROGRAM DESCRIPTIONS; SCHOOL INDUSTRY RELATIONSHIP

Work-study programs or cooperative training prepares carefully screened and selected students for employment in entry level jobs as advanced learners or apprentices. The programs integrate school and work for 16-year old boys and girls in grades 11 and 12 and those at the community college level. The student works half-time under supervision of an employer and a school coordinator and he attends school half-time where he receives related occupational and other course work instruction required for high school or post-secondary graduation. This should not be mistaken for work-experience programs designed to provide a temporary source of income to permit a youngster to remain in school. The four major types of vocational education cooperative programs are industrial cooperative, diversified occupations, cooperative office occupations, and cooperative distributive occupations training. Such programs are valuable to the employer, the community, and the cooperative student, and the costs range from $200 to $400 per pupil, a modest outlay compared to the returns. Documents treating other areas of business training and retraining programs are available as VT 003 414-VT 003 427. (MM)

Work-Study Programs: Part-Time In School / Part-Time On-the-Job

AN ANSWER TO TRAINING NEEDS OF BUSINESS

Preparing Youth for Employment

Vocational education has as its principle purpose the fitting of individuals for useful and gainful employment. Vocational trade and industrial education programs develop skills, abilities, work habits, and appreciations. The needs of two clearly defined groups are met by well designed programs for:

1. those who are employed and have entered the world of work
2. those who are preparing to enter an occupation of their choice.

The vocational preparatory program usually takes place at the secondary or post-secondary school level with grade 14 being the upper limit for such activity. Three types of programs are offered to prepare selected students for entrance into gainful employment. Included are trade preparatory, technical education, and cooperative training.

EDITOR'S NOTE: This is the sixth in a series of Special Supplements on training and retraining programs utilized by business firms. Previous Washington Report supplements cover "Accredited Correspondence Education," November 30, 1962; "Apprenticeship," February 8, 1963; "Career Guidance for Youth," April 12, 1963; "On-the-Job-Training," June 28, 1963; and "Vocational Education: Upgrading Adult Skills," August 2, 1963. All six supplements have been combined in a Manpower Development and Training Kit which may be obtained from the Education Department of the National Chamber. (Single kits free.)

The training offered prepares carefully screened and selected students for employment in the skilled occupations as advanced learners or apprentices. Vocational education should be made available to increasing numbers of young people both at the high school and post-high school levels.

Cooperative Training is Effective

A cooperative program is an efficient and effective way of providing vocational instruction. It develops fundamental occupation competencies usable in full-time industrial and business employment. The program expertly combines the needed academic preparation for high school graduation and course material closely related to supervised job activity. Vocational industrial cooperative programs carefully integrate school and work. In their employment, high school boys and girls, 16 years of age or over, are placed on jobs involving one year and preferably two years of part-time employment and training. The job activities of the trainee are organized in advance. A written agreement between the parent, the employer and the school should place the program on a sound learning basis for the student.

Job performance and progress towards development of skills and knowledge helpful in continuing in full-time employment are provided by the employer and are supervised in cooperation with a representative of the school called a coordinator. On the job, the learner is paid a wage while learning to master the manipulative skills. On a half-time basis in school, he receives instruction related to the occupation and actively participates in course work required for high school graduation.

Cooperative training organized along these lines should not be mistaken for work-experience programs frequently designed to provide a temporary source of income to permit a youngster to remain in school while completing academic requirements for graduation.

Roy Taylor (right) student-learner of Covington, Georgia, is threading wire through a diamond die of a wire drawing machine. The plant superintendent of the Dodge Wire Corporation, Mr. Jack Shelton (left), observes the operation. This work-study program and many others of Newton County High School operate under the daily supervision of a teacher-coordinator, Mr. Alton Blaker.

VT003419

The cooperative program places boys or girls 16 years of age or over in jobs involving a year or more of part-time employment training. The occupation should be one that requires a minimum of 2,000 hours to reach proficiency. Future employment in the occupation should be a definite possibility and continuing on the payroll of the same employer following the training period is highly desirable. One state indicates that seventy different broad employment fields are represented in the training that has taken place in a 10-year period. Because job classifications are in constant flux, the seventy employment fields in no way limit the job possibilities in cooperative training. In 1962, more than 20,000 young people were enrolled in Industrial Cooperative Training courses in the vocational schools of the nation. There were more than 44,000 trainees enrolled in the distributive education cooperative programs with more than 1,800 of them in post-high school programs.

The Teacher-Coordinator Should Be Qualified

The teacher-coordinator is a well qualified individual who conducts the related instruction in school and supervises the employment training on the job. Certification requirements vary from state to state but the teacher-coordinator frequently has no less than two years of industrial experience, three years of teaching experience and special courses in teacher training for cooperative coordinators. These special teachers usually work 10 or 11 months each year. Much time spent outside the schoolhouse is given over to working with employers, visiting training stations, finding placement opportunities, meeting with advisory groups and consulting with parents and students in the home. The coordinator must possess special talent as a counselor and advisor to the student, the parent, and the employer.

Purpose of the Program

The purpose of the cooperative program is to provide opportunity for students to acquire marketable skill and knowledge in an occupation in which they have aptitude. The program makes it possible for the secondary schools to offer vocational training in many occupations in which the manipulative phases cannot be developed in the classroom. It utilizes the employer's establishment as a shop or laboratory in which the employer becomes an integral part of the training process of the school. Student eligibility for enrollment is determined through testing, counseling, reviewing school records, and exploring many occupations in which the individual is likely to succeed.

Kay McDowell is learning floral design and earning a wage while participating in her high school's Industrial Cooperative Training program. She became a full-time employee in floral design in Roanoke, Virginia, following high school graduation.

Types of Cooperative Training

Businessmen and industrialists should find any one or any combination of cooperative training programs suitable for exploration. There are four major types of vocational education cooperative programs:

1. Industrial Cooperative Training (I.C.T.)
2. Diversified Occupations Training (D.O.T.) (or D.C.T., Diversified Cooperative Training)
3. Cooperative Office Occupations Training
4. Cooperative Retailing (distributive) Occupations Training

The diversified training program appears best suited to the very small community where the number of training stations would be few and widely diversified in nature. In medium-sized communities and in the larger centers, the distributive office occupations, or the industrial cooperative training provides an excellent medium for the development of skilled young workers who almost without exception prove to be an economic asset to their employer when retained in the organization following the part-time training period.

Boys or girls sixteen years of age who are juniors or seniors in high school or those enrolled at the community college level should be encouraged to enter a cooperative program. Those taken into the program should have a definite vocational objective. Aptitude, interest, and other tests should have revealed that the

applicant is suited for the kind of training in which an interest has been manifested. Education accomplishment, personality and other factors should indicate that the individual can profit from the instruction and the training given in the program.

The College Co-op Plan

The co-op plan generally operates as follows: A full-time job in an industrial concern or governmental agency is shared by two students, one of whom works while his partner or "alternate" attends college. At the end of a certain period of time the two change places. Thus the job is kept continuously filled, and each student spends about half of his time in college. The length of the period of alternation varies in different institutions, as do the total amount of work experience required and the point in the student's curriculum at which it starts.

While the "two-man team" principle is generally observed in college co-op programs, it is not universally followed and is not a fundamental principle of the co-op system. In some institutions all co-op students go to work at the same time. In individual situations only one co-op student is provided for a given job, which is handled so as to permit him to return to college for the regular class periods. The essential feature is not the "pairing" of students, but the alternation between job and school.

Edwin Miller (standing at left), service manager at the Dean and Harris Ford Service, is deciding with the coop students, Jose Lopez (left) and Severs Vargas (center), whether the engine block should be rebored. A former coop student, now a full-time employee, is looking on at the right. Lawrence Pancost (right rear) is the cooperative trade and industrial coordinator in the Lansing, Michigan, Public Schools.

The co-op plan was originally designed for the education of engineers, and it still finds its widest use in engineering colleges. The plan is probably more directly and easily applicable to engineering than to most other fields, although it is finding increasing favor in schools of business administration, and it has been extended in some institutions to curriculums in architecture, science, education, home economics, the arts and sciences, and other fields.

Betty Brewer is one of the thirty young ladies training as dental assistants in a homogeneous Industrial Cooperative Training program operated in the Fort Worth Technical High School. Student learners are employed for four hours each afternoon in local dental offices. The related subjects classroom is equipped with a demonstration dental unit which is used frequently by local dentists to demonstrate special techniques. The program is endorsed and assisted by the local and the Texas Dental Associations and is under the direction of Miss LaNell Ayer, teacher-coordinator, who is both a licensed dental assistant and a dental technician. Student placement is over 90 percent.

Industrial Cooperative Training in Texas began operations thirty years ago with three programs under the name "Diversified Occupational Training." Eighty public high schools are presently operating programs with a total enrollment of nearly 3,000 students. Teacher-coordinators conduct two related subjects classes each school day, one for first-year students, and one for second-year students. These teachers devote their remaining time to coordination activities. Follow-up studies covering the post two-year period show that 92.5 percent of graduates are currently employed, with 87.1 percent in the occupation for which they trained.

The plan is also in use in a number of technical institutes, some of these programs being among the oldest and largest in the country. It has found limited application in junior colleges, and in at least two institutions at the graduate level. Additional details and a roster of college co-op programs may be obtained from a March 1961 U. S. Office of Education Circular OE-50018, Washington, D. C. (20201)

Values to the Employer

The cooperative program is of value to the employer because it provides him with a carefully selected employee who should possess qualities and aptitudes and abilities needed in the type of work carried on in his establishment. The program provides the employer with the opportunity to develop future full-time employees to his exact specifications with the assistance of the local school. The conscientious businessman and public-spirited employer see in the program the opportunity to share in the development of young men and women, many of whom become profitable workers and useful citizens.

Rodney Jackson (right), a part-time Cooperative Trade and Industrial Education student at the Tuscaloosa County High School in Northport, Alabama, is shown training at the Northside Welding-Garage. His chosen occupation is welding, and he is shown with Jimmy Thrash, a welder, instructing him.

Values to the Community

The program develops a school-business-industry relationship that benefits all three. The young people of the community tend to remain in the area in which they are trained and can find suitable employment. The school tends to become a functional entity in the economy of the community meeting the needs of a greater number of youth. Many citizenship values are derived from the program which introduces youth to the realities of the world of work at an early age.

Values to the Cooperative Student

Cooperative training provides a program carefully fitted to the needs of the trainee. Interests, aptitudes, and abilities are tested. The individual is counseled. Parents and the employer are consulted and much preliminary arrangement goes into the matching of the individual to the job opening. The trainee is learning while earning which frequently motivates the individual to do a better job both in school and in a business establishment. The youth gets a feeling that he has entered the adult world where success must be demonstrated. Records indicate that cooperative students have improved interest and grades in all school subjects once they participate in the program.

What Does the Program Cost?

In a community where a coordinator would draw a salary of $9,000 with up to $600 for travel expenses, and $200 for instructional supplies, the cost per student would range from $200 to $400 per pupil for a group of 30 students. Certainly, this is a modest outlay compared to the returns to the trainee, the employer, and the community. Fitting young people for gainful employment is a worthwhile objective of vocacational education. Many communities need vocational training for their youth. Some cannot afford elaborate shops and laboratories, yet the young people need training if they are to become economically sound citizens in a rapidly growing technological world of work. To many communities, and to many young people, the logical approach to continuation in school and to problems of employment is a vocational cooperative education program.

*BUSINESS EDUCATION; *OFFICE OCCUPATIONS; *PROGRAM DESCRIPTIONS; EDUCATIONAL NEEDS; SCHOOL INDUSTRY RELATIONSHIPS

The function of office education is to help provide trained persons for office occupations. Although vocational education has supported the economic functions of production, distribution, and consumption, a fourth major classification, facilitation, is developing. Its function is to make easy or facilitate the achievement of the goals of production and distribution. Office education in high schools, post high schools, junior colleges, universities, and private business schools are engaged in training to supply the office with workers who are trained and prepared for change. Office occupations account for more than 10½ million persons or 15 percent of the total civilian work force. It is predicted that there will be over 14 million office workers by 1975. Courses that are now offered in many high schools are not adequate to meet the growing need for office workers An adequate program should include a career objective for each student, a vocational office orientation course a vocationally competent and experienced teacher, adequate coordination of course and on-the-job education, and sufficient time for classroom, laboratory, and field activities. Documents treating other business training and retraining programs are available as VT 003 414-VT 003 427. (MM)

Office Education: A Source of Skilled Office Personnel

AN ANSWER TO TRAINING NEEDS OF BUSINESS

The Role of Office Education

It is the function of Office Education to help provide trained persons for office careers.

Traditionally vocational education in the United States has supported the economic functions of the nation's economy.

Economic Function	Vocational Program
PRODUCTION	Agriculture, Trade and Industrial, and Technical Education
DISTRIBUTION	Distributive Education
CONSUMPTION	Home Economics Education

In our world today where more facts about more things must be handled, a fourth major classification of economic function is developing:

FACILITATION	Office Education(Initial, refresher, upgrading vocational education leading to employability and advancement in office careers)

The facilitating function of the office includes the recording and retrieval of data . . . organization and analysis of data . . . coordination and supervision of office activities . . . communication of ideas and data . . . reporting of information for management decision. . . . In short its purpose is . . . to make easy . . . to "facilitate" the achievement of the goals of production and distribution.

On the job the office worker must use many types and kinds of equipment as the tools for an office career. In addition to learning technical skills, post-secondary school programs also stress appearance, poise, and occupational intelligence.

EDITOR'S NOTE: *Office Education* is the seventh in a series of Special Supplements on training and retraining programs utilized by business firms. Previous Washington Report Supplements cover:

Accredited Correspondence Education
Apprenticeship
Career Guidance for Youth
On-the-Job Training
Vocational Education: Upgrading Adult Skills
Work-Study Programs

All seven supplements have been combined in a Manpower Development and Training Kit which may be obtained from the Education Department of the National Chamber. (Single kits free.)

Office Worker is an Important Team Member

Production, Facilitation and Distribution are a team. . . . Each is dependent upon the other two for support and, in turn, helps to support the others. The facilitating function is like the motor of a car . . . the car won't run without the motor, and the business can't operate without the office. Neither the motor nor the office has value in itself, but instead has value as part of the team.

Office education is offered in high schools, post-high schools, junior colleges and universities, as well as in private business schools and the in-training programs provided by industry. At the university level, office education is mainly concerned with teacher training activities supported by programs in secretarial studies, office management and similar specialties.

VT003420

Second Largest Employment Classification

The office today is the second largest employment classification in the civilian work force; for that matter, it is also the second largest work classification in the assignment of military enlisted personnel.

About 15 percent of the civilian work force are engaged in office work . . . more than 10½ million persons are involved. By 1975, it is predicted that there will be over 14 million office workers in the nation. Over 33 percent of the employed white women and about 10 percent of the employed non-white women find work in the office area. Because many of these workers are young women who will marry and stop work, at least for a while, the turnover rate in office occupations is relatively high. This means that the schools must "overtrain" to keep up with the demand for office workers. A look at the Want Ads in the daily paper will show the demand for *skilled and educated office workers.*

New Skills Required

Fact accumulation and data processing call for skills today which are not commonly taught in the typical school curricula. The private business school has in many cases taken a lead in training for up-to-date "automation." The greater flexibility of its organization and the fact that it has its finger on the pulse of the business community enable it to provide specialized training not now available in most public high schools.

It has been estimated that there are a quarter of a million students enrolled in the 1,200 private business schools of the nation. Their functional approach is indicated by the fact that about 40 percent of their enrollment is in night schools, presumably for persons who wish to upgrade their office skills.

Impact of Automation

The impact of automation on office occupations has often been misstated. Research shows that while there may be a temporary slowdown of employment of office personnel, during the transition period most of those "on the books" will be retained in the automated section or reabsorbed by other groups within a business establishment. After a "shakedown" period, the demand for other office personnel begins to climb.

Records control activities in the modern office. Office activities have grown 750 percent between 1900 and 1950 and another 32 percent between 1950 and 1960. It is predicted that between 1960 and 1975 office employment will climb by approximately 45 percent.

In modern industries such as the missile industry, 20 to 25 percent of the employees today are office workers. NASA has reported that clerical and administrative personnel on five of their bases constitutes some 13 to 31 percent of the employees.

Many Youths Trained for Office Work

In addition to the vital part office work plays in our economic world, there is another consideration which must be examined. Office occupations provide 40 percent of our high school graduates . . . 61 percent of the employed girls and 11 percent of the employed boys . . . with their first job. Any program which embraces this many of our young people becomes important simply on the basis of numbers involved. Any improvements which can be made in a program of this type will have benefits affecting a great many young people.

It was reported that more than 4 out of 5 high school graduates take one or more courses in business education. More than 9 out of 10 of the female high school graduates take one or more units in business subjects.

Professors Ralph F. Berdie and Albert B. Hood of the University of Minnesota recently completed a study on the future plans of high school seniors based on a state-wide survey in Minnesota. Interestingly enough, this survey showed that seven percent of the senior girls in the State indicated that they intended to go to business school upon graduation from high school. Out of every six girls who continue their education, one enters business school immediately upon graduation. When we add to these high school graduates, who go on to business school, the number of college dropouts who transfer to full courses at private business schools, we see once again that the private

Calculating

Keypunching

Transcribing

Typing

business school is a highly significant component of the national educational establishment.

Education for office careers takes place in many ways and at many levels. Business education is the fourth largest field in adult education today. Yet it constitutes only 11 percent of the total enrollment in the field.

Office education has something to offer students of many ability levels. For gifted students, there are many rewarding office positions in keeping with their special abilities and many opportunities for advancement. For less gifted students, there are satisfying opportunities in less complex jobs, even jobs calling for rather simple skills.

Courses Not Adequate

The courses that many high schools are now offering are not adequate to meet the growing need for office workers. Our office manpower shortage makes it essential that schools now offer programs for adults, too, to give them initial, refresher or upgrading training for all levels of office activity. Cooperative education, in which the school and industry join hands, offers a possibility which office educators should explore. Changes should be made in the traditional organization of instruction and objectives so as to provide a realistic, clear-cut program of instruction to meet the growing manpower needs of the nation.

Good Future Ahead for Office Workers

The future is unlimited for the office worker who is well trained and prepared for change. There is no doubt that many changes are needed in office education and that many changes will be made because educators and others concerned with office education are growing aware of the need for better and more diversified preparation.

Office skills in the facilitating function are easily adaptable to classroom instruction. Training in this area is of economic importance to individuals, businesses, communities and the nation as a whole. There is now, and apparently will continue to be, a "job vacuum" to be filled in the office area. Our present programs are not filling the demand.

Office work is a field which attracts late entry on the part of those such as widows who must suddenly support themselves, elderly persons who wish partial employment and the handicapped who can operate very successfully in an office environment.

The facilitating function of the office has such a scope that it can include a considerable ability range. Some office occupations are routine and quite simple, others are extremely complex and require the highest of abilities. Office work offers a socially acceptable place for workers of all types where they can be useful and successful citizens.

The Abilene, Kansas, Chamber of Commerce conducted an educational survey in the summer of 1963 of 205 business firms. Each business manager was asked to list what types of training or education would benefit his future employees and would be an asset to his business. The results may have surprised some observers, but "Business Training" was the most suggested for emphasis. The response to the survey indicated some overlap, but in summary, the replies clearly indicated the importance of business education. Of the 205 replies, the top nineteen subjects stressed were: business 75, salesmanship 43, mathematics 37, auto mechanics 22, general education courses 21, bookkeeping 14, secretarial training 13, vocational 11, English 10, home economics 9, public speaking 8, economics 8, general mechanics 7, physics 7, biology 6, typing 6, science 5, mechanical drawing 4, chemistry 4.

Students and activities pictured below represent several of the many Office Training courses developed for youth by the Fairfax County, Virginia, public school system. Office training is one of many vocational-technical programs offered at the new $3.5 million W. T. Woodson High School.

Mr. John Broaddus, assistant principal, said, "It is essential that all youth acquire an adequate education before entering the world of work. We feel that our high-caliber teachers and excellent facilities are helping us perform this important task."

Practicing Shorthand

Card Sorting

Telephoning (Etiquette)

What is Office Education

The title of a course or program is not sufficient to tell you if the program is really an office education program. An office education program is made up of all the general education required courses such as English, mathematics, the sciences, and their electives, and in addition technical office education and related courses leading to vocational competency and advancement in office careers. Specifically one can look to see if there is:

- A career objective statement for each student;
- A vocational office orientation course;
- A vocationally competent and experienced teacher;
- Adequate coordination of course and on-the-job education;
- Sufficient time for classroom, laboratory, and field activities;
- A class session long enough for effective teaching and learning.

The final and the most important criterion in the evaluation of business education training program is that the abilities and skills of the person completing the training are needed in the office.

If Office Workers Are Unprepared Maybe It's Your Fault

Many of our youth who start grade school do not go beyond high school or have an opportunity to enroll in office education classes. Therefore, it is essential that an adequate office education program be established in the high schools, post-high schools and private business schools to provide the necessary skills needed in the offices of today and tomorrow. Cooperation in the development of these various programs between the businessmen and state and local office educators is essential.*

Typewriting, a basic skill in office occupations is taught in modern surroundings by modern methods.

Photo—Courtesy of the United Business School Association, Washington, D.C.

If you are not satisfied with the quantity and quality of the office workers who come for employment, maybe it is your fault!

Have you been in contact with the local office education teacher?

Have you met with and expressed your interest and support for office education to your school superintendent as well as the state supervisor of office education?

Are you serving on a local Office Education Advisory Committee?

Proper Use of Manpower

The maximum use of our manpower potential requires that professionals and technicians be freed from the need to perform routine office activities and hence be able to devote more of their time to their specialized activities. The shortage of people able to record, coordinate and report information needed to provide guidance for managerial decisions is becoming more acute.

Just as it is necessary to maintain a steady source of skilled workmen in production and distribution, so is it necessary to maintain a ready pool of skilled office workers. Both production and distribution depend upon a multiplicity of record keeping today. It is in the interest of all groups to recognize the need for adequate office workers and to translate this need into concrete form in terms of money, facilities, and programs.

*DISTRIBUTIVE EDUCATION; *COOPERATIVE EDUCATION; *PROGRAM DESCRIPTIONS; SCHOOL INDUSTRY RELATIONSHIP

Distributive education is a cooperative program operated by local public schools in which students can be trained in merchandising, marketing, and management. Its goal is to develop full-time employees in the area through on-the-job training and classroom related training. Generally, the high school program places emphasis upon employee training, and the post-high school upon midmanagement training. The instructional program includes the functions of selling, sales promotion, buying, operation, market research, and management. The program is coordinated by a teacher-coordinator trained by both education and occupational experience. This cooperative approach is carried on in nearly 2,000 of about 20,000 high schools. Closely associated with the instructional program is the local chapter of the Distributive Education Clubs of America (DECA). The largest part of the program, in terms of enrollment, is the area of adult education. Documents treating other business training and retraining programs are available as VT 003 414-VT 003 427. Distributive Education

AN ANSWER TO TRAINING NEEDS OF BUSINESS

"We acclaim the initiative these students show, their early interest in the field of distribution and the steps they are taking to pursue careers in this field."

This was the conclusion reached by the W. T. Grant Company in their appraisal of distributive education students in the high school cooperative program.

Right from the start, distributive education students learn the basics of business in our free enterprise system and this, in itself, is highly commendable. For through no other organized educational venture has the spirit of free enterprise been so adequately demonstrated to the young people of this country.

On one hand, distributive education serves as a mainstream to those initiating and advancing their careers in a field of extensive employment opportunity, and, on the other, stands as a bulwark against the real and fabricated challenges to our economic way of life.

EDITOR'S NOTE: *Distributive Education* is the eighth in a series of Special Supplements on training and retraining programs utilized by business firms. Previous Washington Report Supplements cover: **Accredited Correspondence Education, Apprenticeship, Career Guidance for Youth, On-the-Job Training, Vocational Education: Upgrading Adult Skills, Work-Study Programs, and Office Education.** All eight supplements have been combined in a Manpower Development and Training Kit (code #0577) which may be obtained from the National Chamber. (Single kits free.)

The Role of Personnel in Profit Formation

Profits, the heartbeat of competitive enterprise, are related to personnel in much the same way they relate to products and services. When appraised as a profit-producing investment, employees are selected and handled with the same attention to customer preferences and company operating policies as, for example, a model stock plan.

Profits come from personnel who are competent to make discriminating judgments about products and people to the satisfaction of both customer and employer. It all comes down to the basic issue of what a customer is worth in terms of profits to the business and what happens to the profit structure when a customer is lost through inept performance by an employee. Through training programs planned to reflect current practices and also trends in employment performance requirements, distributive education assists employees and management to use *profit estimates* rather than *cost estimates* in making personnel decisions. In this regard, distributive education is dedicated to profit development through people.

The Field Distributive Education Serves

What is this program of distributive education that is attracting so much attention by businessmen throughout the country?

During the twenty-five years it has been in existence nationally, distributive education has grown to become a significant vocational educational program offered and operated by local public schools. It has been developed under the supervision of local school boards and school administration with the help and cooperation of the local business community.

Distributive education derives its name from that vital link between production and consumption called distribution. It cannot be denied that distribution, as a major segment of the economy, plays a significant role in giving vent to the productive might of this country. Employment opportunities in distribution with their accompanying job competencies continually forge ahead as productive achievement, through advancing technology and automation, is constantly realized.

Employment trends, alone, place special urgency

Steve Prince and Brenda Justice arrange a window display in the new Spartanburg (S.C.) High School. Merchandise has been loaned by a local store which employs D.E. students. Distributive Education has been taught in Spartanburg for 25 years.

VT003421

for specialized training in distribution. In a period of 100 years, employment in the broad field of sales and services increased from less than 25 per cent to more than 50 per cent of the labor force. In the four-year period, 1956-1960, total employment in wholesale and retail trade increased six per cent, and in finance, insurance, real estate, and the service trades more than 12 per cent. In face of new business methods and increasing competition, an expanded, organized approach to training is essential to profitable business operation.

Distributive education, which has its instructional base in merchandising, marketing, and management, is organized to provide the kind of training that develops and improves employment qualifications for distributive occupations found in:

retailing	storing
wholesaling	business services
insurance	personal services
real estate	manufacturing
transportation	hotels; housing

. . . and other areas of the economy.

Requirements for Employment

To get, to hold, and to advance in a job in the field of distribution is accompanied by a set of specific competencies. The degree to which these competencies are demonstrated in employment determines the individual's ability to produce profit for the business and to advance his own financial standing.

Marketing competency. One engaged in distribution demonstrates accomplishment in the performance of one or more of the functions of distribution particularly in the art of selling.

Technology competency. One engaged in distribution is associated with a specialty, typically a product or service. The degree of success is dependent upon the knowledge he possesses of this specialty which, in view of the growing complexity of products and services being produced in the economy, may be referred to as his technology. A functioning knowledge of this technology, whether it be furniture, insurance, fabrics, automobiles, petroleum or data processing equipment, becomes the focal point upon which other knowledges and skills are applied.

Basic skill competency. One engaged in distribution makes constant application of the basic skills of communications and mathematics to his employment situation. The whole field of distribution revolves around communications. This fact places the premium on one's facility with these tool subjects as a basis for employment in distribution.

Social competency. One engaged in distribution has a set of personal characteristics which are occupationally relevent. Distribution is characterized as being

Kathy Delwarte, a student trainee in Tucson, Arizona, H.S. is "ringing up the sale" while others in her class observe. D.E. was initiated at Tucson H.S. in 1945. Since then, four more high schools with model stores as D.E. laboratory facilities have been erected. A Distributive Education Advisory Committee of the Tucson Chamber of Commerce works with all five high schools.

people-oriented, not machine-oriented, and as such, human relationships are of paramount importance. Personal traits, appearance, attitudes add up to this social competency which becomes a qualifying factor in employment.

While the immediate job responsibility is generally centered on one of these functions, an accomplished worker has understandings and appreciations of all the functions operating within the business enterprise.

These competency areas may be thought of as the standards for employment in distribution.

The Instructional Program

From these competency areas, the basis of instruction in distributive education is derived. While interweaving the development of social and skill competencies, the distributive educator gives primary attention to the development of the marketing competency and, in some cases, the technology competency. The need for the technology competency shows the desirable relationship of distributive education to other instructional programs, such as agriculture, industry, and home economics. It is in these areas that many of the technologies needed by distributive workers are taught.

The marketing competency is developed through instruction in the functions of distribution. For instructional purposes, those functions are defined as follows:

1. Selling—that which is concerned with communicating to business and individuals,

through the desirable techniques, the details needed for a decision to buy and then assisting them to buy and following through with required service.

2. Sales promotion—that which is concerned with stimulating sales through appropriate advertising, display and other means of publicizing available goods and services.
3. Buying—that which is concerned with procuring products for resale or raw materials to be transformed into products for resale or further transformation.
4. Operations—that which is concerned with facilitating the buying and selling functions such as stockkeeping, traffic, credit, protection, customer services and purchasing.
5. Market research—that which is concerned with investigating the climate for sale of goods and services.
6. Management—that which is concerned with formulating policies and implementing policies regarding men, money and markets available for the merchandising of goods and services.

Distributive education is organized to permit the enrollment of all persons who have occupational goals in distribution. Such an educational opportunity extends to those enrolled in high schools and post high schools as well as to adults who are already employed in distributive occupations.

Cooperative Program

Currently, distributive education programs in high schools and post-high schools are organized as cooperative programs.

The term *cooperative* identifies a plan whereby students are provided, through cooperative arrangements between the school and employers, instruction in the school and in a business organization through part-time employment.

D.E. students in Newark, Ohio, pictured above are receiving instruction in sales promotion. Their classwork provides instruction in merchandising and management.

What businessmen say * . . .

"These youngsters are learning firsthand how our company functions in this great free enterprise system. And, at the same time, they are making an important contribution to our selling efforts."

VICTOR HOLT, JR.
Executive Vice President
The Goodyear Tire and Rubber Company

"Our store managers report that the student worker is usually cooperative, eager to learn, and a substantial asset in the store organization. We encourage our managers to cooperate with their local distributive education program."

HARRY B. CUNNINGHAM
President
S. S. Kresge Company

"We have watched hundreds of D.E.-trained students take their places in our business. We have watched many of them progress up the ladder to store management positions.

L. C. LUSTENBERGER
President
W. T. Grant Company

"We believe that D.E. and DECA serve a necessary and very beneficial function in the opportunities provided young people to better understand and participate in the distribution of goods and services in the American economy."

F. M. SIMPSON
President
Cities Service Oil Company

** Excerpts from correspondence addressed to Mr. Harry Applegate, Executive Secretary, DECA, in 1962.*

The goal of the cooperative program is to develop qualified people for full-time employment in an area for which instruction is to be provided. Generally speaking, the high school program places emphasis upon employee training—the post-high school program upon mid-management training.

Classroom subject matter is drawn from an analysis of competencies needed by those engaged in distribution. The two major aspects of the instruction center on the functions of marketing and on specializations relating to products, services and procedures associated with specific businesses.

Employment in a distributive occupation, as part of the instructional plan, is regarded as an extension of classroom instruction. The "training station," which is the employing firm, provides a laboratory environment in which the student tests, observes, applies concepts and skills presented in the D.E. class in school, thereby assuring transfer of learning to employment situations. In addition, the student gains experience in the occupation which for him becomes the first

step in achieving his career goal.

The program is coordinated by a teacher-coordinator who by virtue of his training, through education and occupational experience, is uniquely qualified to fulfill the role of a vocational teacher.

For those looking into the program for the first time, it should be made clear that D.E. students are not denied the normal academic offerings of the school. Instruction in distribution is only one part of a student's load. A distributive education student qualifies for a regular graduation diploma, having completed or continuing his instruction in math, English, social studies and so on, but adds to his qualifications specifc training for specialized work.

This cooperative approach in developing competent personnel for distribution as well as achieving economic independence for the individual is a sound educational practice carried on in nearly 2,000 schools of the land. In view of the fact that there are about 20,000 high schools, there exists a void that must be filled if the goals of distributive education are to make an impact on the national economy. The challenge appropriately lies with both school administrators and businessmen.

Students Join Distributive Education Clubs

Closely associated with the instructional program is the local chapter of the Distributive Education Clubs of America. This student-directed activity is an effective part of the learning and training process. Chapter activities bring various instructional parts of the program into sharper focus by means of research projects and recognition events. By participating in such activities, which in many cases involve the business leaders of the community, students add materially to their poise and self-reliance, important qualities needed in distribution. DECA's purpose is to develop future leaders for marketing and distribution. A national DECA leadership conference is held each year to provide additional opportunities for individual growth and recognition of achievement.

Adult Program

The largest and most extensive part of the distributive education program, in terms of enrollment, is found in the area of adult education. For the most part, curricula are relatively specialized and geared to the needs of a particular distributive occupation. Such programs are planned to provide instruction that will result in greater job proficiency, preparation for promotional opportunities, or acquisition of new techniques in sales, supervision or management.

A great variety of adult programs exist, many of which are developed in cooperation with trade associations, local advisory committees composed of businessmen, government agencies, or State and local Chambers of Commerce. These specialized programs include, among others, food merchandising, export trade, hotel and motel hospitality, service station management, sales and supervisory seminars, insurance workshops.

In those communities where distributive education is fully developed, any one person may advance toward his chosen occupational goal by participating in the total offerings of the program: high school, post-high school and adult. It is with expectation that those engaged in distributive work may look upon distributive education as a continuing companion in education throughout their careers.

YOUR DISTRIBUTIVE EDUCATION ACTION CHECKLIST

____ Is D.E. offered in your high school? If not:

____ Have you informed school administration of your interest?

____ Have you discussed D.E. with other businessmen? If yes:

____ Have you invited teacher-coordinator to meet with you?

____ Do you know how program is conducted locally?

____ Are D.E. students interviewed, selected and provided part-time employment?

____ Do you provide opportunities for D.E. students to learn? (A training plan can be worked out between you and teacher-coordinator.)

____ Are you available for membership on D.E. advisory committee?

____ Are you active in supporting D.E.?

____ Do you participate in DECA activities?

____ Do you encourage full-time employees to enroll in adult classes?

Additional information on Distributive Education may be obtained from:

*VOCATIONAL SCHOOLS; COMMUNITY INVOLVEMENT; VOCATIONAL EDUCATION; *PROGRAM DESCRIPTIONS; *SCHOOL INDUSTRY RELATIONSHIP
KENOSHA; WISCONSIN

Kenosha, Wisconsin, a medium-sized city of 73,000 is an example of how a community can provide job training for its adults and all of its youth, not merely those who are qualified for college. Support of the city and business community and cooperation of the public school has resulted in successful job training programs in the two branches of Kenosha School of Vocational, Technical, and Adult Education. In 1963-64, 5,600 students were enrolled in day and night study programs. While the nation as a whole has a school dropout rate of 30 percent, Kenosha's is less than 10 percent. Many adults take courses at the school to upgrade their skills. Although state law allows the schools up to 2 mills of the tax dollar, in 1964 1.64 mills were requested and granted. The 1964 budget for the school was $594,726, of which $538,551 came from local and state sources. The school staff has 15 advisory committees from business and industry to keep the course work up to date. Industry also cooperates by supplying many materials at no cost, such as $50,000 worth of fluid power equipment. The school trains in 28 areas of apprenticeship and provides preemployment training, upgrading courses for the functionally illiterate, and other more general courses. Teachers, to be certified, must have both work experience and educational training. Documents treating other business training and retraining programs are available as VT 003 414-VT 003 427. (MM)

Local Technical Schools

AN ANSWER TO TRAINING NEEDS OF BUSINESS

Enterprising Community Points The Way

KENOSHA, WISCONSIN, furnishes an excellent example of what an enterprising community can do to train its youth—and its adults too—for the exacting job requirements of an age of rapid technological expansion.

This medium-sized city of 73,000 population has found the answer to the job-training problem in the Kenosha School of Vocational, Technical and Adult Education. In the 1963-64 school year, 5,600 students were enrolled in day and night study programs, and the school is growing each year. The Technical Institute, a part of this school, was started three years ago. Its expected enrollment for next year will exceed 600 students. This skyrocketing enrollment for technical education indicates that the young people want better education and a better way of life.

This remarkable success record is due to the enthusiastic support of the City and the business community, and the close cooperation among the School, the public school system and local businessmen in meeting problems as they arise and in training students to fill actual needs.

EDITOR'S NOTE: *Local Technical Schools* is the ninth in a series of Special Supplements on training and retraining programs utilized by business firms. Previous Washington Report Supplements cover: **Accredited Correspondence Education, Apprenticeship, Career Guidance for Youth, On-the-Job Training, Vocational Education: Upgrading Adult Skills, Work-Study Programs, Office Education, and Distributive Education.** All nine Supplements have been combined in a Manpower Development and Training Kit (code #0577) which may be obtained from the National Chamber. *(Single kits free.)*

Youth Learn Skill Before Leaving School

Wisconsin has a school dropout rate of 20 percent while the rate for the nation as a whole is 30 percent. In some states it runs as high as 42 percent.

Kenosha, however, has a dropout rate of less than ten percent. This is due, in a considerable measure, to a program operated by the School, in cooperation with the public school system, to find the potential dropout and provide training for him.

The City's goal is to train all its youth, and not merely those who are qualified for college. Thus it is avoiding the error made by so many American communities that slant their high school programs entirely—or almost entirely—toward equipping graduates for college.

Many Adults Go To School

For adults also, the Kenosha vocational institution offers a long list of courses, extending from English refresher, citizenship, and homemaking courses to bookkeeping, business law and welding.

Thus, the school is a general community educational institution of the type that American communities are going to need to an increasing degree in the future. Moreover, what Kenosha has done other communities can and should do, either through a special vocational school or by expansion of the high school program.

The Kenosha school has two branches, the Kenosha Technical Institute and the Kenosha Vocational and Adult School. These are municipal institutions.

Local Taxes Support Training

Kenosha youngsters receive free instruction, but persons living beyond the city limits must pay tuition ($1.50 a day). Wisconsin residents under 21 years of age have their tuition paid by the municipality in which they live.

State law at the present time allows the School up to two mills of the tax dollar. But the full amount has not been claimed. At present, 1.64 mills have been requested and granted. The 1964 budget for the School amounts to $594,726, of which $538,551 will come from local and state sources.

The machine shop of the Kenosha, Wisconsin, School of Vocational-Technical and Adult Education is equipped with the type of tools that the students will find in industry after completing their training program. Businessmen in Kenosha serve on Advisory Committees to assure the students that the equipment is up to date, and that there is a real need for the training acquired.

VT003422

One of the businessmen deeply interested in the school is George I. Craft, Promotional Supervisor, Wisconsin Electric Company, Kenosha, Wisconsin. He said that money to operate the school is always a problem, "but somehow it seems to be available when there is a genuine need for it."

He added: "I think this investment goes back to the people of the community who support the institution through their taxes. They are aware of the work being done and apparently approve of it wholeheartedly."

Two business leaders, Mr. George H. Becker, left, and Mr. George I. Craft, center, are examining a shaper at the Kenosha School with Mr. Oliver Chubb, the School's trade and industrial education coordinator.

Local Advisory Committees Keep Programs Current

The School adopts various methods of keeping abreast of community needs for workers.

George H. Becker, President, Sullivan-Becker Machine Co. of Kenosha, explained that great help toward this objective is provided by a school board which is aware of community needs.

"We check with the various industries," he said, "to determine their training needs." Business and industry often come to the school with a particular training problem. Individuals often contact the school, too, to inquire if a certain type of training is available.

The school searches continually for new occupational areas. How this is done was explained by Mr. Craft:

"The first and foremost way this is done is through some 15 or more advisory committees, made up of people associated with business, trade and industry. All facets of the local economy are represented on these committees which serve in the capacity of advisors to the staff of Kenosha Technical Institute.

"These people spend a great deal of time evaluating the actual curriculum of a given course in relation to their particular interests, and recommend improvements and changes that might be made, and work with the administrative staff of the Kenosha Technical Institute to put these changes into effect.

"They also conduct various surveys of commercial and industrial activity to find what the people in business really want."

A continuous watch is maintained to find out whether new courses are needed.

"Our marketing program," Mr. Craft said, "is now being given a good hard look with an eye toward expansion. This program was essentially retail oriented. As everyone knows, this is just one phase of marketing. The course could well be expanded to include marketing by manufacturers, for instance."

He continued: "We can institute complete courses or short courses to cover a particular need in the area. This is done again and again, especially in the distributive education area, where we set up special courses for certain groups of retailers or manufacturers—even in the insurance area."

New Courses Started When Needed

Mr. Becker explained that when a new program is presented to the school, it is reviewed thoroughly as to its cost and practicability.

He explained: "We certainly have to check to see what equipment is needed and where we can get such equipment. If we can get some industry to supply the equipment, we ask for their help."

An example of a program newly instituted at the school is one on fluid power.

"Industry cooperates fully with the school by supplying materials at no cost," Mr. Becker said. "Let us take this recent one—fluid power. We at the school invested approximately $25,000. Fluid power manufacturers have donated over $50,000 worth of laboratory equipment."

He continued: "It is not only the industrial community of Kenosha which has contributed. These are pieces of equipment from all over the United States, which shows the intense interest on the part of indus-

The Kenosha School makes every effort to bring realism into the training programs. The students of distributive education pictured above in the Checker Training Class use real merchandise and money.

Businessmen in Kenosha decided after a comprehensive study that a course in Fluid Power was essential. The instructor, pictured above, is pointing out some of the complex gear to the first two students to enroll in a two-year technical program.

try throughout the entire country in a program which we put into our school. This is not just a local situation."

Youth Not Permitted To Commit Economic Suicide

How the School works with the public school system to catch the potential high school dropout and keep him in school was explained by Mr. Becker.

"The two school systems," he said, "are working with youth from the junior high school level up to discover the potential dropout, and get him embarked on a program that will keep him in school until he graduates from high school."

> WE CHALLENGE YOU . . . to measure the vocational-technical education program offered to the youth and adults in your community against that of Kenosha. Are you doing as much? Can you afford to do less?

Under this arrangement, the potential dropout is given credit as part of his high school program for vocational courses taken at the school.

Mr. Craft observed that the greatest difficulty facing the potential dropout is that "he doesn't know that he is committing economic suicide.

"If we can point that out to him," he added, "I think this is half the battle right there."

Adequate Guidance Is Essential

A highly important factor in finding and guiding the potential dropout is a counseling and testing program to direct him properly.

Mr. Craft pointed out that the School has "several guidance counselors who work with these people to determine their abilities and interests, and to guide and place them in courses that fit their capabilities."

Alert industrialists in Kenosha admonish untrained workers of the need for training, and of the likelihood that unskilled jobs will disappear with advancing technology.

Mr. Becker said: "In my own small shop, I am advising individuals of the classes they can take at the School. Mine is a small operation. I don't necessarily have job elimination, but I do have job improvement. I let my workers know they can improve themselves in my plant by taking the classes offered at the School."

Functional Illiterate Receive Training

Mr. Craft commented that perhaps the largest educational problem in a primarily industrial community is the training of the "functional illiterate."

"For these people," he said, "we have instituted several courses to upgrade them through their own efforts. Shop math, blueprint reading, industrial electricity—courses of this nature would prepare them to hold a better job than they could get without any further training. These courses tie in with the employer's effort to improve his people and train them."

For persons who do not qualify for technical training either through lack of ability or desire, special courses are provided slanted toward their interests and achievement levels.

Mr. Craft said: "For instance, we train in the area of construction work. These people will be qualified to work in this area—even unskilled labor today requires previous training.

"Checker training for the supermarket clerk, waitress training, service attendant training, basic sales training for dime store and variety store clerks, these are all areas where we must work with people to improve their general economic standing."

In many communities throughout the country, persons interested in working as laborers receive little or no training before applying for their first jobs in building construction. In Kenosha, a special one-year Vocational Certificate program is open to youth and adults alike. The scale model pictured above was constructed by the students.

The two-year courses in Fluid Power and in Metallurgical Technology are comprehensive programs that have been developed at the Kenosha Technical Institute to assist students planning to enter these specialized fields.

"A Man Can Live A Full Life"

Mr. Becker commented: "And what we attempt to do with the young person in our school is to point out to him what he is capable of doing, so that he doesn't hitch his wagon to some unattainable star. We try to set a goal he can reach."

"A man can live a full life," Mr. Craft observed, "by doing what he has the capacity to do."

The Kenosha School aids in apprentice training. It trains in 28 different areas of apprenticeship. It also undertakes to provide preemployment training.

"We invite people to come in for preemployment training," Mr. Becker explained. "We advertise in newspapers. We send out to industry many circulars advising of the classes that we will have, such as shop math and blueprint reading. We have many classes of workers. After attending this type of session, they could go to an employer and build upon a solid foundation."

The students pictured above are perfecting their skills and getting experience in the Metallurgical Class.

Teachers Well Trained

Special attention is paid to the qualifications and continued training of teachers at the School.

"To be certified," Mr. Craft explained, "teachers in our system must have certain practical or work experience in their field, as well as education training with additional courses in the philosophy of vocational education.

"Many teachers go back to school in the summer, but many also go back into industry during the vacation period. At the rate the school is growing, it's practically a year-round operation. In-service training sessions are held for the teachers throughout the year."

All faculty members serve on committees at the School, such as on graduation, public relations, safety, community services, student affairs, and similar groups.

Generally, the Kenosha School is a realistic approach to two primary facts of modern life: The world of today is based on technology, and this places a premium on training which will increase with time. People—youth and adults—have different capabilities and aptitudes, and modern conditions require that they be trained for available jobs that they can perform.

Pub Date - 14Aug64 4p.

VOCATIONAL EDUCATION; *TEACHER SHORTAGE; *TEACHER RECRUITMENT; *VOCATIONAL EDUCATION TEACHERS; TECHNICAL EDUCATION; *SCHOOL INDUSTRY RELATIONSHIP

Experienced vocational-technical teachers are needed to train the technicians and craftsmen to build, test, try out, adjust, and repair the equipment designed by scientists and engineers. Two areas from which these instructors can be recruited are industry and the armed services. Cooperation from business in giving early retirement to trained people on the condition that they take a teaching position is a possible solution to the shortage. School officials and business leaders serving on school boards must recognize the need to establish a salary differential between the instructor who is a journeyman of standing with a B.S. degree and a first-year academic teacher. The American Vocational Association has set up a recruitment and placement service to help meet the needs for vocational personnel to staff the new classrooms and shops being built from the additional funds from state, local, and federal governments. Examples of what some states are doing in vocational education are included. Documents treating other business training and retraining programs are available as VT 003 414-VT 003 427. (MM)

*Experienced Vocational-Technical Teachers**

AN ANSWER TO TRAINING NEEDS OF BUSINESS

Saleable Skills Needed

One of the most perplexing problems facing our nation and innumerable citizens is the lack of saleable skills. Students leave school as dropouts or with their high school diplomas, many with outstanding academic records but with few skills which can be utilized by the technical world of today.

It is a fact that our modern society does not place proper emphasis on and, in too many cases, does not even recognize the important part craftsmen and technicians play in this technological age. Scientists and engineers have created this technological era which may be retarded in the future unless we make trained manpower available. It is needed to build and service present and improved automated machines of industry, the home, the highway and the office.

Many educators and parents have been blind to their responsibility of preparing youth to make a living. This responsibility must be faced now! For many years schools have assumed only the responsibility of teaching the basic skills of reading, writing, and arithmetic, plus subjects required for admission to college. If the student amassed the 16-20 required Carnegie units, he was given his diploma at which time too many schools washed their hands of the entire affair. Then, for a time, industry assumed the responsibility of training the nation's work force. The occupational world has changed. Young people today are facing a highly technical world where employers naturally hire those workers who possess basic technical skills and knowledge.

More Craftsmen and Technical Workers are Needed

We are faced with the fact that we must have in this new era the scientist, the engineer, both of whom are college trained. For each one, however, there are half a dozen or more technicians and craftsmen needed to carry on work which is as important as that of the man who thought up the idea. The men who build, test, try out, adjust and repair the equipment are as vital in our industrial economy as the engineer and the scientist. Through teamwork they build a strong, developing Nation. Many young people desire to attend vocational schools and technical institutions, but they are discouraged from doing so by their parents, advisors, and others. Oftentimes, young people poorly equipped to carry a difficult academic load are prodded into attempting to do so by sincere, but misinformed adults. Thus they become reluctant learners or even drop out of school completely. Fearful and resentful both at school and home, they learn to hate school because of the criticism of teachers and administrators. When they go home, the same refrain is taken up by parents who find fault with the same things which they heard at school. As one young adolescent remarked, "It's really tough to have two sets of critics."

Mr. Clarence E. Stanford, right, is instructing a class in electronics at the Technical Education Center, St. Petersburg, Florida. Mr. Stanford brings to the class a wealth of information—he worked in industry for 32 years in various engineering capacities before joining the faculty at this fine training center.

The instructors in the vocational and the technical schools cannot overcome all the problems involved in developing young people with marketable skills, but they will provide many youth with the background needed for success in the world of work. The graduates of many of these schools are in great demand by industry and business. They enjoy full employment and their status in the community equals that of those who may have traveled the academic route to success.

*Editor's Note: *Experienced Vocational-Technical Teachers* is the tenth in a series of Special Supplements on training and retraining programs. Previous Washington Report Supplements cover: *Accredited Correspondence Education, Apprenticeship, Career Guidance for Youth, On-the-Job Training, Vocational Education: Upgrading Adult Skills, Work-Study Programs, Office Education, Distributive Education* and *Local Technical Schools.* All ten Supplements have been combined in a Manpower Development and Training Kit (code 0577) which may be obtained from the National Chamber. (Single Kits free.) If you have information which you feel could be developed into a Special Supplement, write to John E. Harmon, Director of Manpower Development and Training of the National Chamber's staff.

VT003423

STATE, LOCAL AND NATIONAL ACTION PROGRAMS DEVELOPING SCHOOLS . . .

The Congress, numerous State legislatures, and local school boards are quite cognizant that some vocational schools need additional help. As examples (and only as a minute sampling) of State and local action already in progress, the following programs are cited. In all of them, and in hundreds of others, businessmen actively participated as school board members or served on special project committees:

Georgia. In addition to the two State Vocational-Technical schools that have been in operation for a number of years, twelve new area schools were opened last September. Fifteen additional area schools approved by the State Board of Education are in the planning stages. The building program, involving State and local funds, will cost approximately $21,000,000.

South Carolina. Nine Technical Education Centers have been approved by the State Committee for Technical Education, and the one in Greenville is now operating at capacity. Five centers are scheduled to open this year with more to follow. The centers are built as community projects with the communities providing 87 percent of the cost, and the State 13 percent.

Minnesota. The area vocational-technical schools now number fifteen—three schools began operation last September. Minnesota now has such schools in all geographic areas except the Southwest where at least one school will be started at an early date. All area schools provide vocational-technical education programs at both the high school and post-high school levels.

Pennsylvania. The Chamber of Commerce of Greater Pittsburgh, in cooperation with the Board of Education and the State Employment Office, conducted a comprehensive survey of the kinds of skills that are now needed in the Pittsburgh area. The purpose of this survey was to provide information that will make it possible for the educators to adjust the school curriculum to better equip students to qualify for employment. The respondents to the questionnaire indicated that 6 per cent of their future job

Instructors: From Industry—Services—Or?

What experience should instructors have before they commence to teach? How are they going to secure this experience? These and many other questions that relate to faculty ceased to be purely academic but became real considerations when confronted with the problem of selecting qualified personnel for a new technical institute. The Technical Education Center of Pinellas County, Florida, faced these problems during 1963, when it opened its doors as the first post high school co-educational technical institute in the State of Florida.

A rapidly expanding complex of electronics and space-age industries had prompted a forward-seeking Pinellas County school system to establish such an educational center. A new structure was erected on a tract of 30 acres of land. The air conditioned Center contained laboratories, classrooms and other essential office and service areas. Staffing the new institution became the responsibility of the Director of the Center, Milton E. Larson.

Before discussing the matter of selection of faculty members it is important to understand that the Technical Education Center is a junior or community college-type terminal institution whose major objective is to provide both practical and intensive education in order that the graduates will become employable after two years of technical education.

To achieve this objective, every care was exercised to obtain the best possible instructors for each class. This required that individuals selected needed, in addition to knowledge of the theories involved, good practical experience and the ability to communicate and teach the students.

Occupational instructors in the industrial-technical areas must have obtained the necessary experience either in industry or in the armed forces. This is true of the instructors in several of the technologies at the Technical Education Center who teach in the Day School and to some extent of those who teach in the Evening School as well. Which experience is most desirable for those who teach industrial-technical subjects—that gained in industry or that gained in the armed forces technical operations? The Electronics Technology Department of TEC consists of well-trained, highly skilled faculty members. The backgrounds of two of these instructors provide a comparison between the individual who gained his experience in the armed forces and the one who worked in industry.

William R. Tripp, a member of this instructional group, recently retired as a Lieutenant Colonel in the United States Army. Colonel Tripp served on active duty for twenty-one years with the United States Army Signal Corps, actively engaged in the application of electronics in the field of communications. During this period he spent approximately half of the time as a member of the faculty of various service schools. In discussing his recent change of employment, Colonel Tripp stated that the teaching was relatively easy. He indicated that the major difference in the training situations related to the fact that in teaching students planning to become electronics technicians, these individuals must be qualified to enter employment in any one of several entry jobs; whereas, in the case of the person in the armed forces being trained as an electronics technician, he would be trained in a particular skill within the total field.

Clarence E. Stanford, another member of the instructional staff in the Electronics Department, decided he would like to teach after having devoted 32 years to industry in various engineering capacities such as designing and developing communications and electronics equipment, evaluating and testing antennas on military aircraft, engineering field service, and engineering administration on both civilian and military projects. Clarence Stanford describes his experience in words such as, "Many of these projects were asso-

BUT WILL EXPERIENCED INSTRUCTORS STAFF THE SHOPS AND CLASSES?

placements can be hired with less than a high school education; 23 per cent require high school graduation, including specialized training such as clerical, business, distributive, occupational or vocational; 33 per cent require one to three years of post-high school education or training; and 24 per cent require four years of college or more.

Washington. Of the twenty area schools in Washington which offer post-secondary vocational and technical programs, thirteen are community colleges and seven are vocational-technical schools. It is estimated that these schools now supply one-third of the technicians needed in the State. A substantial increase in technical eduaction programs is planned, and it is anticipated that the community colleges will increase their technical program offerings approximatey 200 per cent.

Colorado. A unique vocational center, the Emily Griffith Opportunity School, was started forty-seven years ago as part of the free public school system of Denver. The school has a yearly average enrollment of 30,000 men and women. It is tuition-free to city residents over sixteen years of age. Classes are held both day and night, every month of the year, offering approximately three hundred different subjects in eight broad areas.

National. To assist the States and communities with additional "seed money," the Congress passed the Vocational Education Act of 1963. It is hoped that this legislation will encourage new and improved programs of vocational-technical training to be launched throughout the country. However, the States and local school boards will continue to raise the bulk of the funds needed for vocational-technical training. This increased effort will help alleviate a part of the unemployment problem, curb the trend of youth leaving school without a saleable skill, and provide technical knowledge for youth who have interests, abilities, and aptitudes in many of the vocational areas which have been mentioned previously. (See Editor's Note on front page of Special Supplement.)

ARE YOUR COMMUNITY AND STATE DOING AS MUCH—CAN YOU AFFORD TO DO LESS?

ciated with the nation's most important military programs and a challenge from start to finish." The transfer from problem solving in engineering to problem solving in teaching technicians was not difficult for Clarence Stanford. The ability to understand and communicate with members of the engineering team made the adjustment to teaching quite easy. Some of the same characteristics which are essential in industry are also important in teaching; namely, patience, understanding of people, cooperation, and the ability to take difficult problems and concepts and simplify them for others.

How have these two individuals drawn from very different previous experiences succeeded as instructors?

"Both are doing an excellent job", said Director Larson. "Their respective backgrounds, though different, have resulted in significant application of the theories involved. The meaning they have given the theories provided the opportunity to attach an understanding to elusive concepts which might have been very vague and meaningless if either individual had moved directly into teaching after college. Teachers, just out of college need to be tried and tempered in the furnace of work, whether this be in industry or in the armed forces."

If students are to be prepared for jobs in industry after two years of technical education, experienced teachers who can give practical meaning to theoretical concepts are essential.

Mr. Eugene E. Lescroat, center, has just completed a very successful year in the Howell Cheney Regional Vocational Technical School, Manchester, Connecticut. The students, Robert Hallowell, left, and Reginald Hathaway, right, are benefiting from the many years of experience which Mr. Lescroat gained as a Senior Chief Repairman of the U.S. Army. Mr. Lescroat also served as an instructor at the U.S. Naval Advanced Metalwork School in San Diego.

Schools Must Recruit From Business

G. W. Haverty, President of the North Dakota State School of Science in Wahpeton, the largest and most comprehensive vocational training center in the state, believes it is essential that faculty members have "cut their teeth" in business. Mr. Haverty said in a recent interview, "we must recruit from industry, we cannot go to another college, we cannot go to a placement service. We scan industry and look for men with real ability that have had not less than five years of real experience." It is important to note that President Haverty insists that his teachers know *what* to teach, in addition to knowing how to teach. He further observed that "we look for men who have had some foremanship experience. Then we apprentice them to a veteran teacher for the first year. During that first year we give what we call in-service teacher training to make them into qualified instructors."

There seems to be general agreement among vocational education directors that they would prefer their faculty to come from the ranks of business.

Business Has Important Role To Play

Business should have a keen interest in providing adequate teachers for vocational schools. This may mean a sacrifice to make available on loan or to retire some of their skilled technicians at an early age. In the long run, however, business and industry will come out ahead, for they will be able to employ graduates of vocational and industrial schools trained by their own people. The business and community will save money, for the men they hire will have the skills heretofore they have had to provide through training. Now, the new employee will have the desirable techniques and abilities needed.

Business frequently retires men with exceptional skill and knowledge at a fairly early age. The so-called "senior citizen" in retirement puts a lot of production skill on the shelf. Most of these men have many skills which could be shared with the youth in the vocational schools and the technical institutes. Many schools are looking for men with these skills.

It would be helpful if business and industry would consider retiring men early on the condition that they would take a position teaching in a vocational or technical institute. In this way, there would be a greater contribution to the youth of our country. It is something that management should seriously consider.

What else can leaders in business do to help solve the problems confronting vocational-technical training? To this question, the educators and other experts in this field give these answers:

1. Help to promote the establishment of more vocational training high schools and junior colleges.

2. Establish a close and continuing relationship with these schools.

3. Don't take the easy way out and follow an arbitrary policy of requiring a high school diploma as a prerequisite for employment. Many jobs undoubtedly can be filled by persons who never graduated from high school. Some firms already have adopted specific policies not to make a high school diploma a prerequisite for employment.

4. Provide up-to-date information and forecasts on the skills and types of personnel that are needed. Such an information pool or job inventory on a continuing basis could be provided through trade and business associations.

5. Give the fullest possible support and participation to on-the-job training phases of vocational education programs.

6. Take an active interest in helping to place graduates of vocational training in jobs immediately upon graduation.

Business participation is probably the most important factor in these problems. All the money that is spent on vocational training in many areas might well be wasted unless business becomes involved deeply in these programs.

Staffing is a Big Job

One can immediately recognize the key role staffing must assume in order that programs will develop commensurate with the already established need. The days of marginal salaries have long since passed and the competition from industry for "top drawer" people is no longer a fair contest. School officials and business leaders serving on school boards must recognize the need to establish a salary differential between the instructor who is a journeyman of standing with a B.S. degree and a first year geography teacher. Such differentials can more readily be made in residential schools and in area schools apart from the comprehensive high school. The salaries of administrators, supervisors, and other professional supporting staff should be similarly upgraded.

The current and anticipated shortage of coordinators, local supervisors, local directors, assistant State supervisors, State supervisors, teacher trainers, and others is startling. One needs only to reflect on the vocational network that is needed to reach all persons in all areas of the Nation to realize the acuteness of this shortage.

American Vocational Association Building Reservoir of Class and Shop Talent.

The American Vocational Association is an organization of professional educators. With the increasing State and local action and the additional funds which have been allocated by Congress, much is being done and can be done to modernize the vocational schools of the United States. Once the classrooms and shops have been completed, then the problem arises as to where one will obtain the necessary teachers with the technical ability to operate machines. The American Vocational Association has set up a Recruitment and Placement Service with which they hope to partially answer the question. There are large numbers being retired monthly from the Armed Forces. Many are being registered for future positions which will be available at the opening of the new school year. There are not enough registered at the present time. Many more are needed if we are to meet the demands which will come from the activities of these specialized schools.

For detailed information about the openings in vocational-technical courses, contact:

*APPRENTICESHIPS; *ON THE JOB TRAINING; *PROGRAM DESCRIPTIONS; SKILLED OCCUPATIONS; PROGRAM ADMINISTRATION

An interview with Edward E. Goshen, retired administrator of the Bureau of Apprenticeship and Training of the Labor Department about the apprenticeship program is reported in question and answer form. Some of his views were: (1) Industry is becoming so complicated that all workers are going to have to be trained, (2) Apprenticeship lasts at least 2 years and can run as long as 6 years, (3) To be successful, the apprenticeship program should be formalized so that the apprentice learns all elements of his trade, (4) Management and labor should set up more apprenticeship programs to forestall possible passage of a law forcing them to do so, (5) Regardless of the size of a shop, or whether it is union or nonunion, a program can be set up, (6) Any training in a vocational school should be limited to the tools and fundamental ideas of the trade, (7) The government role in the program should be to guide and to act as a catalyst, (8) The bureau should confine its work to apprenticeship and on-the-job training programs and should receive additional money to expand its apprenticeship program. Expert Calls For More Apprenticeship

AN ANSWER TO TRAINING NEEDS OF BUSINESS

"The big job is for more employers and employees to set up apprenticeship programs. And this applies particularly to employers. . . . Here is a major challenge. Management and labor should take on this job, and see that it is carried out before somebody decides that a law must be passed which would force them to do it. This is not idle talk. A few years ago a State Apprenticeship Director requested a Congressman to introduce a bill that had all of the earmarks of government control of apprenticeship. I discussed this with the Congressman, and he was in agreement with me that it would not be good for government to control apprenticeship. The bill was never reported out of committee."

This is the way Edward E. Goshen, who retired recently as Administrator of the Bureau of Apprenticeship and Training of the Labor Department, sums up the big job in the field of apprentice training, doubtless the most pressing manpower problem of the present era.

In the following interview, Mr. Goshen gives his views on a wide range of apprenticeship problems. Emphasizing that the need for skilled craftsmen is increasing, he discusses the essentials of apprenticeship and explains that apprenticeship must be formalized so that the youngster learns all elements of his trade.

EDITOR'S NOTE: This exclusive interview with Edward E. Goshen was conducted by the National Chamber's Director of Manpower Development and Training, John E. Harmon. *Expert Calls For More Apprenticeship* and ten other Special Supplements on Training are available in a Manpower Development and Training Kit (code #0577) from the National Chamber. (Single kit free.)

He tells how, by following accepted standards, a small shop employing only a few people can carry out an apprenticeship program, with a prospect of better results than that of large shops if the apprentice receives the careful attention of a craftsman.

In the case of minority groups, Mr. Goshen points out that apprenticeship can best be achieved by the voluntary cooperation of management and labor. He warns against an attempt by the Government to force management and labor to accept members of minority groups as apprentices. The choice of apprentice, he explains, must be on the basis of qualifications, with no discrimination because of race.

Mr. Goshen emphasizes that apprenticeship is a local matter which must be left to management and labor in the area and shop. He admonishes against Government dictation, such as exists in Canada, and against a Government subsidy to stimulate apprentice training, pointing out that it would result in Government regulation.

The proper role of Government, he explains, should be one of a catalyst of help to management and labor in establishing apprenticeship programs, such as the Bureau of Apprenticeship and Training has carried on in the past. In this regard, he says the Government

The Secretary of Labor, Willard Wirtz (center) pictured above, is seen conferring with the former Administrator of the Bureau of Apprenticeship and Training, Mr. Edward Goshen (right) and the Under Secretary of Labor, John F. Henning (left).

would save money by expanding the apprenticeship work of the Bureau. The Bureau should be relieved, meanwhile, he adds, from extraneous jobs saddled upon it in recent years, and from continual interference by top-level political Labor Department officials.

Mr. Goshen, what in your judgment is the primary need at the present time in the field of manpower development and training?

The basic need is the development of more skilled craftsmen. As technological development progresses, and our industrial processes become more complicated, the need for skilled craftsmen grows proportionately. There is a greater need than ever for skilled craftsmen now.

This need places a special emphasis on apprenticeship programs. There is also a need for the development of skills not as elaborate as those for which apprenticeship programs are set up, and some of this can be done by on-the-job training. Industry is becoming so complicated that all workers are going to have to be trained.

Could you tell us just what apprenticeship is?

Apprenticeship is a method of work and training which results in the development of a craftsman or journeyman. This means, under standards which we

VT003424

have long accepted, an apprenticeship lasting at least 4,000 hours, or two years. Actually, apprenticeship periods vary considerably, both for the occupation and the person being trained. Usually, the apprenticeship runs from two to six years.

A person completing such a training program learns all of the elements of an occupation, all of the intricacies, so that he can work on his own with very little supervision, and sometimes with none. He also gains a knowledge of the industry or trade in which he works.

One noteworthy fact is that an apprentice, like the on-the-job trainee, is an employee. He earns as he learns. He is paid wages. He pays taxes. His product is sold, and goes into commerce.

Can a person learn several elements of a skill and not be a craftsman?

Yes. A person who learns two to three elements of a skill can be very skilled and still not be a craftsman. He doesn't have the knowledge or the ability to handle all the elements of the trade. During the two world wars, some of the trades were broken down into jobs involving elements of the trades, and the result was the war production worker, who became skilled in a limited way.

For example, a person could learn to operate a lathe, and he could proceed a step further and learn to set the lathe for two or three operations, but he would not be a machinist.

What is involved in the establishment of an apprenticeship program?

To be successful, the program should be formalized. This means that you abandon any hit-or-miss technique, and set down on paper a schedule of work which is followed carefully so that the person learns all of the elements of the trade. Of course, as is traditional in apprenticeship, he works under the guidance of a craftsman.

In addition to the training in the shop, the apprentice should go to school and acquire a broader knowledge of his trade and of the industry in which he works. Most of this schooling will take place in the evening, perhaps some of it on the company's time during the day. Usually, the instruction is given through the public schools under vocational education programs. In the Bureau of Apprenticeship and Training, we have recommended that the instruction extend for at least 144 hours a year, or four hours a week for a school period of 36 weeks.

Usually, the apprentice's wage is based on a percentage of that of the craftsman with whom he is working. As he gains in knowledge and competence, his wage should increase progressively, so that, by the time he has completed his apprenticeship, his rate will be close to that of the craftsman.

The Federal Committee on Apprenticeship, a management and labor advisory group, has recommended eleven fundamentals to be followed in an apprenticeship program. This is probably the oldest advisory committee to any Government agency, and the Bureau of Apprenticeship and Training has followed its advice over the years. If the Committee's eleven fundamentals are included in a formalized apprenticeship program, the result should be good apprenticeship.

What is the big job in the field of apprenticeship at the present time?

The big job is for more employers and employees to set up apprenticeship programs. And this applies particularly to employers. Too many people who hire skilled craftsmen do not have apprenticeship programs. What is needed is to get these employers interested, and to persuade them to set up apprenticeship programs. If this can be done, the pressure for intervention by the federal government will be removed. Moreover, we shall increase the number of craftsmen, and thereby serve an increasing need. We do not dare be short on craftsmen again.

Here is a major challenge. Management and labor should take on this job, and see that it is carried out before somebody decides that a law must be passed which would force them to do it.

What is the range of occupation or skills that would be susceptible to apprenticeship?

Many people seem to think that apprenticeship should be limited to the building trades. That is not true. There are a lot of trades that have got to have apprenticeship, regardless of what it is called. Apprenticeship by its very nature is not limited to any single business or industry. The apprenticeable occupations range from chefs and cosmeticians to jewelers and dental technicians. Metal trades and printing trades are large areas for apprenticeship.

Under what circumstances is a local committee on apprenticeship set up?

Where workers are organized in unions and have collective bargaining agreements, the Bureau of Apprenticeship and Training has advocated that a local joint apprenticeship committee be established. There are about 7,000 such committees in the United States now. These committees meet regularly, develop their own apprenticeship programs, watch the programs and see that they operate properly.

How does management in a firm that does not have union representation for its employees set up an apprenticeship program?

In that case, a committee cannot be established because the workers are not organized. They have nobody representing them, and if you created a committee you would run the risk of being accused of forming a company union. You work out a program very similar to the ones that you find in your area. The program should be formalized, of course, if you hope to realize your best expectations, and it should include the eleven fundamentals recommended

by the Federal Committee on Apprenticeship. Management should follow the program just as is done where an apprenticeship committee is in operation. Somewhere the employer has to come into contact with his craftsmen to solicit their support in developing his apprentices.

How would a small corporation employing only twelve or fifteen people, or even fewer, go about setting up an apprenticeship program? Is it possible for a small business with only two or three people in the shop to set up a program?

Regardless of the size of the shop, or whether it is union or non-union, a program can be set up. The main thing is to see that tried and proven principles are incorporated in the program, that it is formalized, and that it is carried out properly. If a group of small employers wish to establish a program, they could create one that would apply to all the shops in the area, and they could set up a committee to handle it. But each shop would have to operate its own individual program.

As for the very small shops, they ought to have a program because they should look ahead. They probably expect to grow. In any case, what are they going to do in the future for craftsmen if they do not develop them? I would think that a manager of a plant that made personnel analyses would decide that he should have at least one apprentice.

An apprentice can turn out well in a small plant, sometimes better than in big plants. He can get more attention in a small plant. A lot depends upon the interest that the employer takes, and a great deal too on the apprentice himself.

There should be an evaluation of the apprentice's progress as he goes along, both on the job and in the school. Care should be taken to see that he is advancing in both places. Then there must be employer-employee cooperation. The craftsman must teach the apprentice. Moreover, the apprentice must realize that what he has taken on is not a path of roses. It is hard work, and the youngster must show something of what it takes to master his trade. If he does, he is assured of a good wage. But the interested youngster should be urged to take a good, hard look at what he is undertaking before he commits himself, and his employer, to the discipline of apprenticeship.

There is one danger to watch out for. This is that the employer doesn't decide after a certain period of time that the apprentice has become a craftsman, and leave him without supervision while he is out soliciting business.

What do you think of the idea that a prospective apprentice should have preliminary training before undertaking an apprenticeship?

This is a very good thing if it is done properly. This would mean getting the people who are going to give the pre-job training to do it as the industry wants, and to give the training that the industry wants. Any training in a vocational school should be limited to the tools and fundamental ideas of the trade or industry, and should be given on the direct advice of management, or of management and labor. Pre-job training, properly done, will give the youngster a chance to have some understanding of what he is getting into before he attempts an apprenticeship, and will enable him to decide better whether he wants to undertake it.

What would you say about a youngster getting at least a high school education before undertaking an apprenticeship?

I would urge the youngster who wants to get into a trade to stay in school as long as he can, and to get all the education he can. He should try to get a high school education at least.

All this is not to say that a boy cannot become a craftsman if he is denied an education because of circumstances. It is simply that he should get all the education he can.

In recent months there was issued a new federal directive intended to accelerate the placement in apprenticeship programs of persons from minority groups. What is your view of this problem?

I think the proper way to handle this problem, and to get minorities into apprenticeship programs, is to meet with people from management and labor at all levels, and ask for their help. Management and labor have never let the Government down in a time of difficulty. They know, moreover, that the minority question is a problem today, and that it has to be met head on.

Asking for the cooperation of management and labor, in my judgment, will produce better results than trying to force them to take on minorities. You can, of course, place a minority person in an apprenticeship program. But the result that you're after is to make sure that he learns his trade. If management and labor accept him in a voluntary spirit, then they have assumed a responsibility to train him, and they will help him. But if you force him on them, there is certainly a question as to how much interest they will show in the apprentice.

All persons do not have apprenticeship qualifications, because they do not adapt themselves to the type of work involved. This applies regardless of race. The main question to be answered, in considering a person for apprenticeship, is whether he is adaptable, and whether he can and will learn the trade. And in answering this question, there should be no discrimination.

In your judgment, the development and expansion of apprenticeship programs has to be on a voluntary basis?

Definitely. The actual apprenticeship has to be conducted by management and labor. Government cannot

do this job. An apprenticeship program must be planned to meet the local situation. An individual trade varies in different localities and even in different shops. Thus, apprenticeship is purely a local matter. If the eleven fundamentals, recommended by the Federal Committee on Apprenticeship, are included in an apprenticeship program, it can be recognized by having it registered with the Bureau of Apprenticeship and Training, or with a state agency where one exists.

What do you think of the proposal that the Government should determine the period of training under apprenticeship programs, or of the system in effect in Canada under which everybody has to follow standards drawn up by management and labor and approved by the Minister of Labor?

As for the proposal that the Government should fix training periods, I disagree completely. The people in industry are closer to this matter. They know how fast the apprentice can assimilate the necessary knowledge and skills. As for the Canadian system, I would not advise its use in this country. This is too much Government intervention, and it detracts from the necessary local control over apprenticeship programs. It establishes a rigidity that would diminish effectiveness and discourage cooperation in many places. The basic difficulty is that you may get somebody administering the law who has never worked in industry.

What do you think of the proposal that Government should subsidize apprenticeship?

America doesn't need such subsidies. Management and labor in this country have demonstrated that they will finance their own apprenticeships. Millions of dollars are now being spent in the development of apprenticeship programs over and beyond the wages paid the apprentices. Apprenticeship costs and wages are a proper cost for tax purposes. When you take a subsidy, you are bound to get Government regulation, many times by individuals who know nothing about your business. American industry does not want the bureaucratic method in apprenticeship, and this goes for both management and labor.

What, in your judgment, should be the proper role of the Government in the development of apprenticeship programs?

It should be one of guidance, and of encouragement to induce management and labor to set up apprenticeship programs. Government should act as a catalyst. This has been in a large degree the function of the Bureau of Apprenticeship and Training, whose origin dates back to the industry codes of the depression era. The Bureau has acted as a kind of coordinator in promoting formalized programs that would establish common practices in trades that could apply throughout the country.

Has the Bureau been able to carry out this policy effectively?

The Bureau has been effective in creating a greater interest in apprenticeship programs, and in encouraging the establishment of more formalized programs in which every element of a trade is included.

In many cases, it has helped those interested in setting up apprenticeship programs to analyze their personnel, and to establish formalized programs. In doing this, the Bureau field staff has passed on the experience of others who have conducted successful programs.

However, the Bureau has had to operate under many handicaps. It has usually received lip support from Secretaries of Labor who have failed to back up their praise of the Bureau by providing it with the necessary staff. Moreover, in recent years the Bureau has been diverted from its basic objective by having other tasks assigned to it. When the Manpower Development and Training Act came into existence, the Bureau was assigned the job of working on it, and meanwhile no money was provided for a field staff for this work. Naturally, the apprenticeship work suffered.

The Bureau has also been hampered by some unfortunate cases of bad management in the Labor Department. Department officials have at times gone over the head of the Bureau chief by sending directives to subordinates in the Bureau. There have been some other instances in which the Bureau head has been bypassed. This, of course, is not conducive to good morale or to teamwork. It is a kind of operation that seems to plague government. Business does not function that way. Ford Motor Company does not try to tell Firestone how to make tires; it only furnishes specifications.

What, in your opinion, should be done?

I think the work of the Bureau should be confined to the apprenticeship program, and to the on-the-job training program under the Manpower Development and Training Act. Then it should receive some additional money to enable it to expand its apprenticeship work, and to promote the solution of this problem by voluntary methods. This actually would involve a saving for the Government, because these work programs cost less than the institutional type of program in which the emphasis is on training which is not associated with a job in industry. I believe there should be less attention to this type of program.

In addition to relieving the Bureau of extraneous jobs so that it could do what it was set up to do, the Bureau administrator should be given freedom to act, without continual interference from top-level officials in the Labor Department, who are not informed or have very limited knowledge of these types of programs within industry. There should be one line of command extending to him from one supervisor.

If these things were done, I am sure that the Bureau could get on with a highly essential work.

*HEALTH OCCUPATIONS EDUCATION; *PARAMEDICAL OCCUPATIONS; VOCATIONAL SCHOOLS; *PROGRAM DESCRIPTIONS; PROGRAM ADMINISTRATION

Health occupations now employ more than 2.6 million people and represents 5.4 percent of the gross national product. The investment in hospitals alone now totals more than $20 billion. Each professional worker requires about 12 persons to serve in supporting roles. Public vocational funds have been used in training health workers for nearly 50 years, but the effort was expanded in 1956 to provide training for practical nurses and similar health workers. The Springfield Massachusetts Technical Institute, has pioneered in developing a post-secondary course for training dental, medical laboratory, and physical therapy assistants, practical nurses and surgical technicians. A five-floor adjoining hospital makes available cooperative hospital-school externship agreements which provide opportunities for students to correlate theory and practice. Advisory committee keep the program attuned to the medical needs of society. Advantages of training in one facility are: (1) Instructional facilities may be shared by several classes enrolled concurrently, (2) It provides one location with which health agencies may communicate in relation to student training, worker need, and graduate placement, (3) Short term training courses can be organized and operated on a temporary basis, and (4) Applicants have the opportunity to select from a number of occupational objectives. Documents treating other business training and retraining programs are available as VT 003 414-VT 003 427. (MM)

Training For Health Service Occupations

AN ANSWER TO TRAINING NEEDS OF BUSINESS

Health Services Expanding Rapidly

Health services today comprise one of the fastest growing occupational fields, with occupations ranging from the highly professional, for which several degrees may be required, to the skilled worker trained on the job. The health industry in the United States has become big business, as shown by these facts:

- National expenditures for health services increased from $12 billion in 1950 to $33 billion in 1964, when it represented 5.4 per cent of the gross national product. The investment in hospitals alone now totals more than $20 billion.
- In addition to hospitals, huge assets are invested in clinics, physicians' offices, the pharmaceutical industry, medical laboratories, and other related facilities.
- Health findings and services seriously affect all business and industry.
- Productivity of the Nation is dependent on the health of the people.
- More than 2.6 million people are now working in the health industry, which ranks seventh among all industries.

EDITOR'S NOTE: Training for Health Service Occupations is the twelfth in a series of Special Supplements on training and retraining programs. Previous WASHINGTON REPORT Supplements cover: Expert Calls For More Apprenticeship, Accredited Correspondence Education, Apprenticeship, Career Guidance for Youth, On-the-Job Training, Vocational Education: Upgrading Adult Skills, Work-Study Programs, Office Education, Distributive Education, Local Technical Schools, and Experienced Vocational-Technical teachers. All twelve Supplements have been combined in a Manpower Development and Training Kit (code 0577) which may be obtained from the National Chamber. (Single Kits free.)

Lack of Health Services Costly

The direct costs of health services in a community can be computed in dollars and cents. At any given time, the local hospital can cite a figure on its average cost for a patient's stay of one day.

To cite an example of this cost to communities, and to the nation, let us take a look at the estimated cost of malaria in the 13 southern States prior to World War II. Some half a billion dollars a year was lost in productivity alone. The malaria control program, on the other hand, costs about one-tenth of the productivity loss. Another example can be found in the effects of poliomyelitis on the economy. With the tremendous achievements in controlling this dread disease, New York City reports that $2.2 million a year is being saved in funds which formerly were spent in caring for those stricken with the disease. Many persons who have failed to take flu shots have suffered unnecessary attacks of epidemic flu as a result, with consequent debilitating illness and loss of time from work.

Mrs. Janet Wolsky, left, is supervising a class in nursing at the North Dakota State School of Science at Wahpeton, N. D. Approximately 140 students enroll in this practical nursing course every 12 months. The course lasts 12 months. Instruction is given in medical, surgical, obstetric, geriatric, pediatric nursing. Courses include basic pharmacology, anatomy and physiology. This is one of more than 900 state-approved programs in the Nation where students may prepare to become licensed practical nurses.

Professionals Need Supporting Personnel

Public awareness of professional occupations in the health field has been sharpened as new knowledge, new services, and improved health measures have been developed. As demands for more and better health services have grown, national concern over providing sufficient numbers of physicians, dentists, nurses, pharmacists, and other professional practitioners has also increased. Medical services today are more accessible to all Americans.

In general, the public is much less aware of the phenomenal growth in numbers and kinds of health

VT003425

Medical Assistant

Medical Laboratory Assistant

Dental Assistant

Mrs. T. B. Thompson, Assistant Principal of Springfield (Mass.) Technical Institute pointed out that the students pictured above are reaping some of the benefits of this fine eight million dollar institute. She further observed that this 150-room school is located on a 24-acre tract in the center

workers who are supportive to the professional health manpower. In order to deliver health services to more people, physicians, dentists, and others have increasingly used larger numbers of supporting personnel with highly diverse skills and training. Current estimates of health manpower show that each professional requires about 12 persons to serve in these assisting or supporting roles. Of these 12 persons, roughly half are skilled workers whose preparation for the job requires from one to several years of specialized training.

Improved health services are being provided where well trained supportive personnel are available to work with and under the supervision of professionals. To illustrate, experimental studies have shown that one trained dental assistant who assists at the chairside can increase a dentist's services to patients by 35 percent. With two such assistants, one dentist can provide 65 percent more service than if he were working alone. Another recent study showed that, when professional nurses used trained licensed practical nurses in the nursing team in place of aids, both the quality and quantity of nursing care provided to patients increased remarkably. Significant contributions to improvement of patient services are being made by other trained workers, such as medical assistants for doctors' offices; occupational and physical therapy assistants for rehabilitation centers, nursing homes, homes for the aging, and hospitals; laboratory assistants for medical laboratories; technicians for dental laboratories; and management personnel for nursing homes and hospital units.

The general public needs to understand that, if quality health services are to be made available, training for the vast army of technicians and assistants needed in the health services must be provided and that safeguards must be initiated to assure acceptable standards for their training and utilization.

Public vocational funds have been used in training health workers for nearly 50 years. In 1956, this effort was expanded when State and Federal agencies increased expenditures to provide training for practical nurses and other similar health workers under public vocational education. The success of the training program for practical nursing is a matter of record. Under the stimulation of these annual appropriations, remarkable progress was made in providing licensed practical nurses.

Training Health Manpower Through Public Education

A larger share in training "middle" or supporting health manpower can and will be undertaken by public education. The difficult job of providing both quantity and quality in training for health occupations is being streamlined today in public vocational and technical programs in every State and Territory. Training may be provided in secondary schools, in adult vocational and technical schools, in community colleges, as well as in other education agencies. All such training includes instruction in organized classes and instruction in clinical application of the knowledge gained. Levels of training range from the simple short training program of six weeks such as a course for aids to the more complex program at the technical level. The latter may range from secondary school to community college level instruction.

Training for jobs in this field is usually open to almost any age group from 16 to 60. While women seem to be predominant in the health occupations, men are welcomed in most of the occupations. With the increasing growth of technical jobs such as medical laboratory assistants, inhalation therapy tech-

Surgical Technician

Practical Nursing

Physical Therapy Assistant

of the city. More than 400,000 feet of classroom space, an auditorium, gymnasium and cafeteria as well as a separate five-story completely equipped hospital, have been made available through the efforts of the citizens of Springfield.

nicians, and X-ray technicians, there will continue to be increasing demands for men as well as for women recruits.

Training Center Approach

One community with vision has established something of a precedent in training health workers. The Board of Education of Springfield, Massachusetts, attacked this problem in a rather unique way several years ago. Beginning in 1949, the Board operated a State approved adult program to train practical nurses in the Springfield Technical Institute.

Recognizing the opportunity to link vocational education to the further development of technical programs in the areas of health service occupations, the Springfield Technical Institute has pioneered in the development of the following courses offered on a post-secondary level of training: dental assistant, medical assistant, medical laboratory assistant, practical nursing, physical therapy assistant and surgical technician.

Students are selected on the basis of achievement, aptitude, health factors, personal interview and a complete review of records by an Admissions Committee.

Training facilities include a fully equipped modern dental clinic, laboratory and classroom as part of the Springfield Technical Institute. A five-floor hospital adjoining the school provides medical, surgical nursing arts laboratories, classrooms, specialized teaching units, an overhead projector, visual aids and a medical library. Teaching staff includes a dentist, a dental hygienist, a registered medical technologist, a registered physical therapist, and six registered nurses.

Important to note is the fact that hospital facilities have been made available to the school, for the purpose of expansion of offerings in the health service occupations, by vote of the Springfield Municipal Hospital Board of Trustees. This is another indication of a forward, enlightened look taken by cooperating community agencies.

Cooperative hospital-school externship agreements make it possible for students to correlate theory and practice with supervised on-the-job clinical experience. Community affiliating agencies now number fifteen, spotlighting an outstanding example of how school and community services go hand in hand to further enhance Springfield vocational goals.

Courses Are Kept Current

Advisory committees, consisting of outstanding representatives from business, industry, dental and medical professions, and the hospital team, meet periodically with administration and staff to consult on problems of course standards, curriculum, instructional method, lecture to students, equipment selection, and placement. Their counsel and guidance is invaluable in keeping the programs attuned to the medical needs of society.

Placement opportunities are unlimited for the well qualified graduate. The constant demand for trained assistants to work as partners on the health team permits the school to enjoy a unique placement record yearly.

Businessmen Endorse Health Training

Mr. Paul J. Greeley, Executive Vice President of the Springfield, Massachusetts Chamber of Commerce said, "the specific occupational skills for which the school is currently providing training were selected after careful study and review with the personnel of health services agencies. The training is of the highest quality using the very best of equip-

ment. A genuine simulated work situation is provided in order to make the training as meaningful as possible."

The President of the Third National Bank of Hampden in Springfield, Russell B. Ness, said this about the school, "I have visited the school on many occasions and have personally witnessed the care with which this training is provided. The recruitment of students for these courses is meticulously done and close supervision is provided throughout the training programs. The community is fortunate to have such occupational training available."

Advantages of Training in One Facility

Of interest to all communities are the many advantages in centralizing training for health workers in one school facility. The following comments, made by persons visiting the Springfield center and others of similar nature, reflect a conservative evaluation of such projects:

- The center is more effective in producing the kinds and quality of workers needed for the variety of occupations in the health field.
- Instructional equipment and facilities may be shared by several classes enrolled concurrently. The library, laboratories, and teaching models are available to students, whether enrolled in nursing, dental assisting, medical assisting, or similar programs. Faculty teaching in subject fields such as anatomy, bacteriology, or community health and resources may serve all groups enrolled. Better qualified teachers can be employed for such specialization.
- The center provides one location with which health agencies in the community may communicate in relation to the training of students, needs for trained workers, and placement of graduates.
- Short-term training courses that are not continuous over the years can readily be organized in such a center and operated on a temporary basis where necessary.
- Applicants have the opportunity to select from a number of occupational objectives and may be more readily counseled into the career best suited to their capabilities. Students may transfer easily if their career objectives change.

Improvement in Instruction

There is much to be learned about education for health careers. The isolated class that prepares for one health career is limited in resources. A center for such training provides the environment for experimentation and demonstration in such areas as teaching, student selection, and curriculum for in-school, adult, and post-secondary trainees. Vocational educators have responsibility for determining the most effective methods that will provide all the training needed by all the types of people to be trained for a wide variety of health occupations. This cannot be done in the isolated training class operated periodically.

The U.S. Office of Education is increasing its efforts to provide more training programs and thereby alleviate some of the shortages in supporting health manpower. Under the Vocational Education Act of 1963, $118,500,000 was appropriated for fiscal 1965 to cover all purposes of the act. The federal funds allocated to States must be matched at least fifty per cent. A State's allocation may be used for construction, for program operation, for the instructional costs in programs, and for other required educational services.

Many Groups Contribute to Program

The business community can discharge some of its responsibility for cooperating with school officials and health service groups in planning programs and facilities for the training of health manpower. Representatives of business now serve in an advisory capacity to the schools offering training programs. In many States, they also serve as advisors to the State Board of Education in the development of the statewide program for training health service workers.

State Departments of Vocational and Technical Education administer the Federal-State matching monies that are made available to local schools for training health manpower. States also provide consultative services to local school districts and communities in developing training programs. One or more consultants for health occupations training are employed in most State departments of vocational and technical education. (List may be obtained from the Health Occupations Section of the U.S. Office of Education, note address below).

The Division of Vocational and Technical Education of the U.S. Office of Education also furnishes consultative assistance to States, national groups, individuals, and other agencies through the staff of the Section on Health Occupations Training.

Pub Date - 16Apr65 4p.

*INDUSTRIAL ARTS; *PROGRAM DESCRIPTIONS; SCHOOL INDUSTRY RELATIONSHIP; GENERAL EDUCATION

In industrial arts the student uses techniques and devices which, with further training, will be useful to him in industrial employment. While vocational-technical education fits individuals into gainful employment, the function of industrial arts is to arouse interest and aid in discovering aptitudes. In grades 7 through 9 in public schools, 3,361 or 57.4 percent of all male students study industrial arts. It is offered in elementary, junior high, high schools, and college and adult levels of instruction. Over 200 colleges prepare instructors of industrial arts. Even though industrial arts is one of the major programs of instruction, 29 states have no state supervisor, four have supervisors assigned to general education, and 17 have industrial arts supervision in vocational departments. The need for increased supervision at all levels is the single greatest need of the profession. Business and industry leaders could support the program by (1) encouraging local and state supervision, field and study trips, and cooperative work-study programs at college level, (2) making summer jobs available for teacher in-service education, and (3) aiding local schools to become acquainted with the needs of industrial arts programs at the local level. Documents treating other business training and retraining programs are available as VT 003 414-VT 003 427. (MM)

Industrial Arts

AN ANSWER TO TRAINING NEEDS OF BUSINESS

What is Industrial Arts?

The subject of industrial arts is a field of study in which the student is introduced to the use of techniques and devices which, with further training, will be useful to him in industrial employment. For example, the industrial arts students may learn something about drafting. But his industrial arts training does not make him a draftsman.

There is a wide difference between the study of industrial arts and vocational-technical education. The latter is designed to fit individuals into gainful employment as semi-skilled or skilled workers or technicians in recognized occupations.

Industrial arts has a special function in relation to the total program of education. It is one of the "general education" offerings. It serves to arouse interest and to aid in the discovery of aptitudes that relate to special preparation for industrial employment. It aids students who need instruction involving general shop and related experience. It can be especially helpful in keeping potential dropouts in school.

Industrial arts is the *only* program of public education which has accepted the responsibility of teaching the basic *concepts* of industry and technology to *all* students. A recent U. S. Office of Education report showed that in grades 7 through 9 in public schools 3,361,699 students, 57.4 per cent of all male students, were studying industrial arts.

Industrial arts is an essential part of the education of all youth and is offered on the elementary school, junior high school, high school, college, and adult levels of instruction.

In the elementary schools the general education function of industrial arts places emphasis upon the planning, construction, and experimentation with industrial processes required in the social studies, science, mathematics, and language arts activities. Pupils receive satisfaction and understanding by producing objects which they have previously tried to visualize. Abstract concepts are made more meaningful with concrete evidence. The elementary classroom teacher assumes the responsibility for integrating industrial arts activities with other learning experiences. The teacher has the assistance of an industrial arts consultant or supervisor who provides additional instruction and guidance.

In the junior high school, industrial arts is often a required part of the total program of education for all youth. Programs fulfilling the general education and pre-professional functions are common at this grade level. Students are usually guided through a series of exploratory experiences in areas such as drafting, elemental electronics, graphic arts, metalworking, and woodworking. In most junior high schools, these courses are taught by teachers specially trained in their subject area and in laboratories designed for industrial arts exploratory activities.

Junior high school student working on a technical illustration of a small gas engine at Portola Junior High, Los Angeles. (Courtesy: Los Angeles City Schools)

Students in some high schools may elect industrial arts as a major discipline to be followed during their entire school program. In high school programs, the

VT003426

EDITOR'S NOTE: Industrial Arts is one in a series of Special Supplements on training and retraining programs. Previous WASHINGTON REPORT Supplements cover: *Training for Health Service Occupations, Expert Calls for More Apprenticeship, Accredited Correspondence Education, Apprenticeship, Career Guidance for Youth, On-the-Job Training, Vocational Education: Upgrading Adult Skills, Work-Study Programs, Office Education, Distributive Education, Local Technical Schools and Experienced Vocational-Technical Teachers.* These Supplements have been combined in a Manpower Development and Training Kit (code 0577) which may be obtained from the National Chamber. (Single Kits free.)

general education and pre-professional functions prevail in one and two semester courses and provide instructional shopwork of a non-vocational type offering orientation in the areas of appreciation, production, consumption, and recreation through actual experience with materials and goods. As in the junior high school, professionally trained teachers instruct students in facilities designed for student laboratory activities.

Industrial arts at the collegiate level provides:

- Broad general education courses for all college students
- Specific service courses for other college majors

High school students using the latest teaching aids and devices as they experiment and learn the theory and application of electronic circuitry.
(Courtesy: Tretow-Northfield High School, Northfield, New Hampshire)

- Instruction leading to industrial arts teaching
- Instruction leading to technical training for industry.

Industrial arts facilities at many of the leading colleges and universities are multi-million dollar investments and are staffed by skilled and professional faculty members. Most of the nation's four-year industrial technology programs are related to or originated from industrial arts teacher education programs. In many cases teachers receive their technical preparation from the technology programs.

In the area of special education, industrial arts provides programs for slow learners and physically handicapped as well as the mentally gifted students. Adult education programs provide beneficial avocational activities and permit development of skill and involvement in creative expression in industrial materials.

A Deterrent to Dropouts

One of the significant contributions of industrial arts to the total school program is its motivating influence. The Statistical Department of the U. S. Office of Education predicts that 900,000 students will drop out of school before completing high school this year. Relatively few of these children are mentally incapable. Many of these students would fulfill their potential if education would show them the ideas and concepts which give life meaning. Industrial arts and similar courses if well organized and adequately staffed could create enthusiasm and interest in school life. As a true study of technology and the interpretation of our industrial culture, industrial arts motivates the underachiever, alert or dull, the potential scientist, the consumer, the academically talented, the pre-engineer, the occupationally oriented, and other students as they realize that their whole life will be influenced by the wonderful but complex world of industry.

Modern Teaching Methods

Industrial arts teachers emphasize the use of student *laboratory* activities in design, planning, experimentation, construction, testing, and analysis of industrial materials processes and mechanisms. Student activities are combined with an organized program of lectures and demonstrations which involve a variety of two and three dimensional teaching aids and devices. In each course, students gain experience and knowledge *about* the materials, tools, machines, and products used in the area of industry they are studying. Many industrial arts teachers have conducted experiments using the newest and most promising methods of instruction—instructional television, team teaching, and machine and programmed instruction.

Sources of Teachers

Over 200 colleges and universities throughout the country have departments dedicated to the preparation of quality instructors of industrial arts. Teachers prepared by these schools meet the same certification standards established by state legislative bodies

High school students learning different industrial methods of hot-working of metals—casting—forging—welding.
(Courtesy: Menomonie High School, Menomonie, Wisconsin)

for all liberal arts, business, and other academic school programs. In most states, minimum requirements include a baccalaureate degree, and often a fifth year of graduate instruction. A typical teachers college program includes:

- Industrial arts—both depth in the subject he wishes to teach and breath in related industrial subjects. For example, a drafting teacher studies technical and architectural drawing, electronic drafting, photo and graphic reproduction, industrial illustration, industrial design, surveying, descriptive geometry, and industrial responsibilities of the draftsman, designer, and engineer. Related study includes courses in electronics, industrial materials, industrial processes, graphic arts and photography.
- Related science—physics, chemistry, and mathematics. It is no longer possible for a teacher of industrial arts to be just a practitioner. He must know the how and why of his subject and be able to instruct students in the concepts and principles of science which apply to industry.
- Humanities—courses in history, government, English, philosophy, and arts, or an organized humanities program involving all disciplines, form the broad base of liberal education for industrial arts teachers. Education in the humanities is valuable to the industrial arts teacher as he conducts his own life and guides the lives of his pupils.
- Professional education—psychology of learning, instructional procedures, vocational guidance, evaluation, philosophy of education, and student teaching or teaching internship. These are the foundation fields which a teacher needs in order to understand how people learn and react and how to organize and teach his subject.

In addition to this organized program of instruction, many industrial arts teachers have some industrial experience. This experience is gained by either precollegiate employment or by a cooperative work-study program between the industrial arts department and industry.

As a representative with some knowledge of industry in public education, the industrial arts teacher is able to bring to his teaching area a background of thorough preparation in his subject area, the exact sciences, humanities, and professional education. He has the same teaching credentials as the other regular teachers.

Supervision of Teachers

The industrial arts teacher should be supervised by a specialist who has a broad knowledge of industry and its needs as well as a thorough understanding of the industrial arts program of instruction and the problems of teachers. Unfortunately, the industrial arts teacher is often supervised by a person unfamiliar with the total needs of industry or with the potential of the industrial arts department under his direction. Even though industrial arts is one of the major programs of instruction in the country, twenty-nine states have no state supervisor of industrial arts. Of the remaining states, four have supervisors assigned to the general education supervisory staff and seventeen have industrial arts supervisors in vocational departments. The need for increased supervision by industrial arts specialists at all levels of the school system represents the single greatest need of the profession.

Students preparing to become industrial arts teachers must develop a broad understanding of industrial materials, processes and mechanisms. This picture shows students preparing for a hydro-carbon distillation experiment as they study the structure, properties, and potential utilization of industrial materials in a modern industrial arts testing laboratory. (Courtesy: San Jose State College, California)

Importance to Business and Industry

Industrial arts programs deserve the interest, support, and assistance of business and industry. As a representative with a knowledge of industry in public education, industrial arts:

- Provides guidance in helping students who have aptitudes and interests in industrial subjects to select careers commensurate with their abilities. These careers may be in engineering, industrial science, technology or trades.
- Provides initial training in industrial arts subjects for future technicians, engineers, and scientists.
- Provides instruction in the manner business and industry serve the economic and social lives of Americans.
- Provides instruction in technical understanding,

Austell Sherard, industrial arts teacher from Tuskegee Institute, receives instructions on how hydraulics contributes to the operation of tape controlled machine-tools at Parker Hannifin Corp., Cleveland. Mr. Sherard attended a six-week institute for the in-service education of industrial arts teachers, sponsored and financed by the National Fluid Power Society. Following the institute, the participants were provided an opportunity to work with one of the fluid power companies. (Courtesy: NFPA)

performance, and the integration of the creative arts and exact sciences with industrial subjects.

- Develops student abilities in industrial problem solving, creativity in design, inventiveness, and exploration with materials and mechanisms.

With more active participation of industry in the industrial arts program, students, who hold the future of business and industry in their hands, will be appraised of the varied needs of industry.

An Action Program for Business and Industry

Business and industry leaders should acquaint themselves with the industrial arts programs in their communities. Since these programs identify their principal objective as "teaching industry and technology," local business and industry personnel should express a vital interest in these programs. Most industrial arts programs could profit from the following support:

- Local and state supervision—encourage Boards of Education to appoint people specially trained to serve as industrial arts supervisors. These supervisors will coordinate the industrial arts programs, provide for improved standards of instruction, and provide the path by which industry can communicate directly with the industrial arts teacher.
- In-service education of teachers—following closely to the need for supervision is in-service education of teachers. The industrial arts teacher serves as an informed spokesman for industry in the school. However, industrial changes and developments take place in the research and manufacturing division of industry. In order to maintain a high level of instruction, the teacher must remain aware of changes and developments. While most teachers subscribe to industrial journals, this avenue cannot provide the degree of training needed. Business and industry should make summer jobs available to teachers—jobs which will acquaint the teacher with new industrial developments in his subject and *not just* summer employment. Business and industry should also encourage the development of school district in-service education programs and contribute the time of leading personnel to serve as instructors and resource personnel.
- Field and study trips—encourage and permit schools to arrange field and study trips through industrial plants. Help the industrial arts program use industry as part of their classroom.
- Cooperative work-study programs — encourage colleges and universities to develop cooperative work study programs. These should not be just jobs for college students but should be organized programs whereby the prospective teacher is sent to different departments and serves in different capacities to learn about the total responsibility of his area of instruction. They may be titled industrial internship or industrial training and should have as their primary goal the education of the prospective teacher.
- Aid local schools—become acquainted with the needs of industrial arts programs in the local community. Business and industry should cooperate and assist with the abilities and resources at their disposal.

A close working relationship between business and industry and the industrial arts program will result in improved education for the student and a great step toward the solution of the shortage of competent personnel for occupational, technical, engineering, and research positions.

*VOCATIONAL REHABILITATION; *JOB TRAINING; VOCATIONAL ADJUSTMENT; OCCUPATIONAL THERAPY; PHYSICALLY HANDICAPPED; MENTALLY HANDICAPPED; *PROGRAM DESCRIPTIONS; *EMPLOYMENT PROGRAMS

The Vocational Rehabilitation Administration (VRA), a federal agency, works in close collaboration with the states to create efficient and gainful employees from handicapped citizens. In 1965, state agencies were providing rehabilitation services to 450,000 disabled persons, of which 130,000 were to be employed that year. In recent years the number being rehabilitated has increased at the rate of 8 percent annually, and a minimum goal of 200,000 annually is sought. Among the 1964 rehabilitant disabilities were (1) muscular, skeletal amputation, 37 percent, (2) mental illness, 10 percent, (3) visual impairment, 6 percent, (4) hearing and speech, 6 percent, (5) mental retardation, 6 percent, (6) cardiac defects, 5 percent, and (7) others, 30 percent. Over 70 percent of the rehabilitated in 1964 were unemployed when they began to receive services, and their conversion from tax consumers to wage earners cost about $16 million in a one-time outlay, a saving of many more millions in federal and state public assistance funds. More than 900 research or demonstration projects have been supported by the VRA. Documents treating other business training and retraining programs are available as VT 003 414-VT 003 426. (MM)

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

Vocational Rehabilitation

DEVELOPING NEEDED MANPOWER

What is Vocational Rehabilitation?

Broadly speaking it is a Federal-State grants-in-aid program for preparing handicapped persons for entry or return to the world of work. For nearly fifty years a relatively little publicized agency of the Federal Government, the Vocational Rehabilitation Administration, has been working in close collaboration with the States which do the actual rehabilitation work, and the business-industry community to create efficient and gainful employees from our handicapped citizens. While not enjoying the notice of poverty programs or the school dropout, the rehabilitation services have aided our physically and mentally handicapped, the least visible of the unseen poor, in their search for a full, productive, and independent life. The handicapped have been enabled to acquire self-reliance and gainful employment after months, years, or even lifetimes of dependence upon family and/or welfare agencies. Now thanks to desire, will, and even heroic efforts they have purpose, skill, and remuneration which benefits not only themselves, but those upon whom they were once dependent.

Who do we Rehabilitate?

A wide variety of disabilities are represented among the clients of the modern rehabilitation agency, and the list is getting longer as research continues to find means to restore people who have in the past been thought to be beyond help. Victims of cardiac ailments and of strokes, for example, are beginning to show up with greater regularity on the lists of clients being served. Young people with emotional troubles and with mental retardation are being worked with to good advantage. Add to these the deaf, the blind, the orthopedically handicapped, and the others with disabilities who, without special assistance, would be unable to work, and it can be seen that vocational rehabilitation is a growing field. This year state agencies are providing rehabilitation services to 450,000 disabled persons. Of these, more than 130,000 will take their place in the ranks of the employed this year. The number being rehabilitated has increased at the rate of eight percent annually during recent years. A minimum goal of 200,000 is earnestly and actively being sought.

Vocational Rehabilitation Administration

The chart indicates the kinds of disabilities dealt with successfully by the State-Federal program of vocational rehabilitation during 1964.

Why we Rehabilitate

Miss Mary E. Switzer, Commissioner of Vocational Rehabilitation, points out that the primary motivation behind the rehabilitation program is humanitarian. She says:

"Rehabilitation is simply in line with common humanity to assure the well being of disabled people. It is equally in line with the American free enterprise system to assure them of their full opportunity to contribute their labor and brain power to our society, and to realize their own sense of personal dignity and worth."

The economic benefits also are great. Over 70 percent of the people rehabilitated last year were unemployed when they began to receive services. Most of the others had comparatively low earnings. Moreover, substantial numbers of those rehabilitated were receiving public assistance and residing in tax-supported institutions. The mean weekly earnings of persons rehabilitated during 1964 jumped from $7.55 at intake to $42.87 at closure.

Another way of looking at these figures is to note that in 1964 conversion of these disabled people from

VT003427

tax consumers to wage earners of economic independence cost about $16 million in a one-time outlay of funds. The expenditure of this $16 million saved many more millions in Federal and State public assistance funds. While estimates vary as to the exact amount rehabilitated workers repay through income taxes, the money expended does serve to remove them from welfare roles and dependence upon family and/or community charity.

In brief, rehabilitation gets people off the relief rolls onto the tax rolls, or prevents them from getting on relief in the first place. It is good business and good economics to restore them to their rightful place in the community.

Howard A. Rusk, M.D., a top authority on rehabilitation, puts it another way. He says, "If we don't do something about using the disabled, the chronically ill, and the older age group in our economy, by 1980 for every able-bodied worker in America there will be one physically handicapped, one chronically ill, and one beyond the age of 65 on that able-bodied worker's back."

How do we Rehabilitate?

In many instances, the right combination of services, applied with dedication and skill by knowledgeable experts, can make the difference between a wholly disabled person, unfit for work, and a well-trained worker. This combination is provided under the vocational rehabilitation program. The men and women who have had this help are specially trained in the line of work for which they are best fitted.

Disabled people get this training—and health restorative services as well as other services—from their state vocational rehabilitation agency. Often, welfare agencies send them. Some are referred by their doctors or by hospitals; some show up on their own initiative. However they get there, after they are measured against three simple standards of eligibility, they are given intensive personalized care which will ready them for the future.

The eligibility standards screen out those for whom there can be no reasonable expectation that rehabilitation services can overcome the disabilities which prevent them from working; also screened out are those who are insufficiently disabled so that their present work is interferred with and those who are either over or below legal working age, as that term is defined in their state.

Those who remain include people with a wide variety of disabilities—the deaf, the blind, the victims of birth defects, paraplegics, amputees, epilepsy victims, arthritics, the mentally retarded and the mentally ill, persons who have suffered from heart disease, cancer and stroke, and victims of many other disabling conditions.

Services provided by State Rehabilitation Agencies

These people are interviewed and tested to discover vocational potential. Medical examinations are conducted. Then, a qualified rehabilitation counselor—a key person in the rehabilitation process—is assigned. Together, the disabled person (called a "client") and the counselor plan a course of action which will help build up the trainee's skills and abilities. Medical help and physical aids, such as hearing devices, braces, and artificial limbs, are made available when necessary. In the event that special training is needed, the counselor will make necessary arrangements. The client, for example, may be sent to a rehabilitation center for specialized physical conditioning and job training; or he may be found to be in need of acquiring job skills which can best be learned in a workshop.

E. I. du Pont Photograph

Dan Sherwood is in charge of a tool room at the Dupont Company's Newport, Delaware, chemical plant which stocks 3,500 items. He has invented an adjustable jig (shown above) on which he does precision sharpening of drills when work is slack.

Workshops

There are an estimated 1,000 workshops of various kinds in existence around the country. These centers train disabled persons in work skills; they provide useful employment for persons who are too severely disabled for regular competitive employment; and in filling those needs, they offer a helpful source for various kinds of contracted services to industry.

Packaging, various light assembly jobs, mailing, and a wide variety of practical tasks are done on a contract basis for businessmen in workshops. Workshops fall

under the provisions of the Fair Labor Standards Act, but in order to allow them to operate to the benefit of their clients, they are allowed to pay wages lower than the statutory minimum to handicapped workers.

The U. S. Department of Labor issues certificates allowing this exemption. These provide a floor rate which must be guaranteed to every client employed in the shop. Thus, if the going wage in the community for a particular job is $1.50 per hour, the workshop client must be paid $1.50 per hour if he is doing the same job at the same rate of production. If his disability allows him to be only one-half as productive as the outside worker, however, then he should be paid not less than 50 percent as much, or 75 cents an hour.

Businessmen wishing to investigate the uses of workshops in carrying out contracted jobs for them should check with the State vocational rehabilitation agency in their area for information on location and tasks performed.

Vocational Rehabilitation Administration

The 120,000 rehabilitated people served during 1964 entered employment of every kind. Most of them took paying jobs. An exception were the unpaid family workers. The 15 percent shown in the chart as entering family employment were in large part, disabled housewives who, in being enabled to take up once again the burden of home management, often released another member of the family for competitive employment.

The Right Man for the Right Job

When all the evaluation and training is completed and the client is deemed ready for outside employment, the counselor will help him find the right job. To this end, he will work with the local State employment office, with interested businessmen in the community who have expressed a desire to hire handicapped people, and with other sources of information on the job market.

Thus, it can be seen that when a businessman hires a disabled worker through vocational rehabilitation, he is getting a person who has been thoroughly assessed as to his capabilities, and one who has received such training as is needed for him to perform well on the job.

Skilled and unskilled help Available

Disability is no respecter of persons. While it is true that many disabled persons before rehabilitation are at the lowest end of the economic scale, this is far from saying that they are necessarily unskilled or without potential. Disabled persons are filling some of the most skilled jobs, some of the most demanding managerial positions in our society. It is this fact to which rehabilitation workers are referring when they say that "It is not what a man has lost but what he has left that is important."

A rheumatoid arthritis patient, for example, with severe curvature of the spine underwent training as a bookkeeper under vocational rehabilitation agency auspices. His frail appearance made it extremely difficult for him to find a job, but at last he went to work as a bookkeeper and inventory clerk and has been highly successful.

It would be possible to fill pages with individual success stories. Paraplegics are filling many office jobs with great credit. Deaf people are hard at work in many positions in which high-noise level, combined with the need for deep concentration, make it difficult for hearing people to keep up production. Blind people are being hired for computer operation and as linguists.

Blind people have distinguished themselves as individual businessmen and women in the operation of vending stands and snack bars in public and private office buildings. Under the general supervision of the

NEPH Week 1945-1964

Miss Majorie Peggy Morgan, a paralytic polio victim at age 13, who is confined to a wheelchair is the very efficient credit manager of Harold Fillmore's Gem State Oil Company in Twin Falls, Idaho, where she has been employed for ten years.

State-Federal vocational rehabilitation program, these vending stands did a $54 million gross business in 1964, returning an average profit of $4,452 to 2,641 blind or near-blind operators.

In short, within the reasonable limitation set by the nature of the disability and the natural potential of the individual, there simply is no job—managerial, skilled, semi-skilled, or unskilled—which some disabled person cannot fill.

What kind of Workers do they make?

Recently, a Los Angeles company, Hallman Products, Inc., hired a group of people suffering from epilepsy. The new employees perform a variety of jobs—assembling, packaging, shipping and receiving, supervising, machine operations, and other duties. Herb Jacobs, the firm's vice president, told this to the President's Committeee on Employment of the Handicapped, about their performance: "These people are so used to being rejected that when they are put in a position of equality, their reaction to this acceptance is loyalty. We feel we have a better group of workers than would be expected from any group of normal workers."

Another illustration: The Rahn Granite Surface Plate Company of Dayton, Ohio, hired its entire skilled labor force from among the ranks of deaf persons. Says R. J. Rahn, president and founder of the company: "Our deaf mute employees . . . are earning two to three times as much as they had in their old unskilled jobs. We have been well repaid. We have absolutely no labor turnover. We do not have to continually teach replacement employees. Furthermore, these men go all out on their job. There is no stalling or time-killing in our shop."

Whether employers have hired their entire work force from among the ranks of the handicapped, or have simply hired handicapped workers as they applied and were found qualified, the story is much the same. The handicapped worker in a job he can do is just as competent, able, and loyal as his fellow employee who has no disability.

Commissioner Switzer has said: "Just as there is no limit to human ingenuity, so there is no limit to the abilities of the so-called disabled. We think of a man confined to a wheelchair as disabled—and so he is, if by disabled we mean that he cannot take part in a foot race. But the mind—the personality—the skill of hand is not impeded by that disability. Perhaps the surprising thing about disability is that we are still surprised by handicapped people who overcome their handicaps."

More than 900 research or demonstration projects conducted by public and non-profit institutions have been supported by the Vocational Rehabilitation Administration. Through such research, both at home and overseas, many new services have been developed which enable those with disabilities to be fitted into modern employment.

Along with the basic service program and the research effort, VRA supports another vital area of work in rehabilitation—professional training. In response to serious shortages of virtually every discipline in the rehabilitation field, the training program works with colleges, universities, hospitals, and medical schools to train rehabilitation counselors, physicians, nurses, therapists, and a number of others. Grants are awarded to institutions for teaching to defray part of the cost of instruction; for traineeships to provide tuition, stipends and other costs for students enrolled in the training program; and for a combination of both.

In addition, there are presently 14 rehabilitation research and training centers set up at universities, usually in combination with hospitals or rehabilitation centers, to offer intensive work in research to students interested in rehabilitation careers. From these centers, started as recently as 1960, and still being enlarged and strengthened, is coming a constant stream of basic research and personnel for tomorrow's rehabilitation efforts.

Other Activities of Vocational Rehabilitation

The Vocational Rehabilitation Administration has important public functions other than the support of the Federal-State program of rehabilitation services. The basic service program owes much of its scope and direction to new concepts in rehabilitation that have evolved over 10 years of research.

Those who plan the direction and operation of the public program now must be aware of great changes in the labor market; the kinds of jobs and the kinds of employees needed to fill them; the increased demand for skills; the rising place of the scientist, clinician, and the technician; the decline of "common labor" as a means of livelihood; and the smaller number of persons needed in agriculture. These factors have a wide influence on the course of vocational training and placement of persons restored to employability. Many of the answers are found in rehabilitation research and demonstration programs.

POPULATION DISTRIBUTION, POPULATION GROWTH; *POPULATION TRENDS; *LABOR MARKET; *METROPOLITAN AREAS; *MANPOWER NEEDS; *EMPLOYMENT PROJECTIONS
NEW YORK; NEW JERSEY; CONNECTICUT

The regional population and jobs forecast included the areas of regional distribution of population, comparison of regional population forecasts, changes in the structuring of the region, the region's industrial structure, geographic distribution of jobs, and comparison of regional employment forecasts. Data used as a basis for forecasts were from the U.S. Census Bureau, the Statistical Guide for New York City, the Annual Reports of the New York City Board of Education, Bureau of Labor Statistics, the New York Bureau of Labor, and previous studies. Some of the principal findings were: (1) New York City's continuing losses of population have stopped, (2) There will be a growing importance of multi-family structures in the outlying areas, (3) The region will grow from the present 17.8 million to 23.1 million residents, (4) Job growth will closely parallel population growth, (5) By 1985 there will be a gain of 1.8 million jobs in the region, (6) Construction, finance-insurance-real estate services and government will be the high job growth industries, (7) Manufacturing, transportation, communications, public utilities and wholesale and retail trade will have relatively low growth rates, and (8) Manhattan will continue its headquarters role as the center of economic activity of both the nation and the region and will have an increase of 150,000 jobs. In this report jobs encompass all wage and salary workers, self-employed, unpaid family workers, and secondary jobs of dual jobholders. Twenty-one tables and charts present relevant data. (MM)

INTRODUCTION

The planning of public transportation and terminal facilities as well as the promotion and protection of commerce in the New York-New Jersey Port District is a basic function of The Port of New York Authority under the Port Compact of 1921 which established the bi-state agency.

As a part of this basic planning responsibility, the Port Authority, in 1963, published *Metropolitan Transportation: 1980* which was subtitled "A framework for the long-range planning of transportation facilities to serve the New York-New Jersey Metropolitan Region" and dealt with all factors involved. As this report stated at the beginning of Chapter 2 entitled "Population and Employment in the Future:"

"Basic to the transport problems that will be faced by the New York Metropolitan Region in 1980 are the growth prospects for population and for business and industry."

In his foreword to *Metropolitan Transportation: 1980,* Port Authority Executive Director Austin J. Tobin said:

"Planning is a continuous process. New data are produced continually, on the basis of which conclusions must be reshaped. For this reason, the present study will be kept under review by the Port Authority during the years ahead and its findings modified to reflect changes in conditions, in experience and judgment."

This study represents just such a modification of the basic findings on population and employment trends included in Chapter 2 of *Metropolitan Transportation: 1980.* The research involved covers those factors which are most fundamental to future development of the Port District, and upon which the future transportation requirements of the Region ultimately depend.

Population growth and job development in the Metropolitan Region and its geographic sectors provide the bases for developing specialized transportation facilities. Before plans can be made and designs transformed into steel and concrete, specific questions must be answered. Where will the population grow? Where will the new jobs and economic activities associated with them be located within the Region? How will job location and job opportunities relate to each other? The forecast covering the next two decades, contained in this report, was developed to answer these questions, as well as many others.

PRINCIPAL FINDINGS

The population forecast which appeared in the Port Authority's *Metropolitan Transportation: 1980* employed the unpublished (1961) revision of the projections contained in *Metropolis 1985 (1960),* the volume containing the principal findings of the New York Metropolitan Region Study. A further revision appeared in Regional Plan Association's *Spread City* report (1962).

All of these forecasts envisioned a rather loosely structured metropolitan area resulting from a high growth rate in the outlying suburbs with population settlement primarily in the form of single family dwellings. *Spread City* maintained that continued population loss would occur in New York City, following the experience of the 1950-1960 decade, and that growth in Regional population would occur in the intermediate and outlying suburban areas.

However, the factors which produced the *Spread City* type of growth between 1950 and 1960 are diminishing. One of the major findings of our current study is that New York City's continuing losses in population have stopped. In fact, the trend has been reversed.

A second major finding is that future population settlement in the Region will be marked by the growing importance of multi-family structures in the outlying areas, as

well as in the core of the Region. As a consequence, this forecast foresees a more closely knit, densely developed Region than was anticipated in the two earlier forecasts.

All sectors of the Region will gain in population, with the New Jersey and Connecticut Sectors growing at a more rapid rate than the New York Sector. The overall gain will be substantial. Over the next 20 years, the Region will grow from the present 17.8 million to 23.1 million residents—a gain of 5.3 million persons.

Contrary to earlier projections, this study forecasts an increase of 150,000 jobs in Manhattan by 1985 and the continuation of its headquarters role as the center of economic activity of the nation, as well as of the Region.

Outside of Manhattan, the study finds the job growth in the geographic sectors of the Region will closely parallel population growth.

By 1985, there will be 9.5 million jobs in the Region—a gain of 1.8 million jobs over the present level. The New Jersey Sector of the Region will have a job growth rate double that of the New York Sector, 36 per cent as compared to 18 per cent. In both Sectors, the suburban counties will have the highest growth rates while the older, more densely settled areas will have relatively low growth rates.

On a Region-wide basis, construction, finance-insurance-real estate, services and government will be the high job growth industries. Manufacturing, transportation-communications-public utilities, wholesale and retail trade will have relatively low growth rates.

METHODOLOGY

The basic ingredients of the forecast are data on population, housing, land use, and employment for the counties making up the Region. Entering into the forecast is an assessment of past trends, changes in the critical relationships in labor force participation, household size, age groupings, and a host of other factors. Just as important as the determination of intra-regional dynamics involving these factors, however, is the changing relationship of the Region to the states of which they are a part, and to the nation.

Previous studies of this nature have covered the Region, which, as defined by the Regional Plan Association, includes 22 counties in New York, New Jersey and Connecticut. However, an analysis of the most recent journey-to-work data revealed that Mercer County, in New Jersey, is now an integral part of the area's traffic generating system. Consequently, it was included in the Region for the purpose of this study. Except for comparisons with other forecasts and where noted, the 23-county Region is used throughout this report.

In this report employment figures refer to the number of *jobs* rather than a count of employed persons. Jobs encompass the totality of wage and salary workers, self-employed, unpaid family workers, and the secondary jobs of dual jobholders.

SECTION 1

The Population and Job Forecast

Population and Jobs in the Metropolitan Region 1965-1985

REGIONAL POPULATION: 1965-1985

The Regional Studies Section of the Port Authority's Planning and Development Department foresees a population growth of 5.3 million in the Metropolitan Region during the next 20 years, an increase of 29.8 per cent, to a total of 23 million persons by 1985. With the nation's population growth projected at 38.8 per cent during this same period, the Region will continue its declining share of the nation's population from 9.3 per cent in 1965 to 8.7 per cent in 1985.

Table 1

National and Regional Population Growth: 1965 and 1985 (in thousands)

	1965	1985	Change Number	Change Per cent
United States	191,338	265,515	74,177	38.8
23-County Region	17,760	23,053	5,293	29.8

Regional Distribution of Population

Population growth will not be distributed evenly throughout the Region. The population changes anticipated within the 23-County Region will be of a much more dynamic nature than the changes in the Region's population as a whole. The largest absolute population increase will occur in the New York Sector of the Region which will grow by 2,518,000 persons from 11,875,000 in 1965 to 14,393,000 in 1985. (Table 2) However, the New York Sector's estimated share of the Region's population will decline from 66.9 per cent in 1965 to 62.5 per cent by 1985. New York City will add more than 600,000 inhabitants, but its share of the Region's population will decline from 45.6 per cent to 37.9 per cent by 1985.

[1]Mercer County included in 23-County Region

Projected Population Growth and Population Distribution in the Metropolitan Region by Urban Zones 1965-1985

Among the counties outside New York City in the New York Sector, only Nassau will decline in its share of the Region's population, from 7.9 per cent to 7.2 per cent between 1965 and 1985.

The eleven county New Jersey Sector will exhibit both absolute and relative population gains during the forecast period. The gain here will amount to nearly 2,500,000 residents between 1965 and 1985, and New Jersey's share of the Region's population will increase from 28.9 per cent to 32.9 per cent. Seven of the ten New Jersey counties taken individually will show both absolute and relative population gains. Hudson County will grow by 26,000 people but its relative share of the Region's population will decline from 3.3 per cent to 2.7 per cent by 1985. Union County will gain 141,000 inhabitants, but its share will decrease from 3.2 per cent to 3.0 per cent and Essex County's share will decline from 5.3 per cent to 4.4 per cent in 1985, but its population will grow by about 77,000.

Fairfield County in Connecticut will increase its share of the Region's population from 4.2 per cent in 1965 to 4.6 per cent in 1985, adding 325,000 inhabitants to its current 745,000.

Comparison of Regional Population Forecasts

Several forecasts of future population and employment in the Region have been prepared in recent years by various regional agencies. The Regional Plan Association's *Spread City*, a 1962 publication, contained projections of population and employment growth for the 22-County New York Metropolitan Region through 1985. The Port of New York Authority's *Metropolitan Transportation: 1980* included a series of forecasts based on the projections made for the New York Metropolitan Region Study which had been revised to take into account 1960 Census of Population data. The forecast described in this report, designated as the Regional Studies Section Forecast, was adjusted for comparative purposes to the Regional Plan Association's 22-County Region.

As may be seen in Table 3, the Regional Studies Section's estimates for population growth between 1965 and 1985 are higher than the projections developed by Regional Plan Association and *Metropolitan Transportation: 1980*. The difference in the 1965 base for each forecast is due to the fact that the estimates for 1965 in *Spread City* and *Metropolitan Transportation: 1980* were developed several years ago, whereas the Regional Studies Section's estimate is current and takes advantage of more recent data.

Table 3

SUMMARY COMPARISON OF REGIONAL POPULATION FORECASTS: 1965 and 1985
22-COUNTY REGION (in thousands)

	1965	1985	Change Number	Change Per cent
Regional Plan Association Spread City	17,180	22,170	4,990	29.0
Metropolitan Transportation 1980	17,180	22,170	4,990	29.0
Port Authority Regional Studies Section	17,468	22,671	5,203	29.8

Changes in the Structuring of the Region

The major differences among the projections of the Region's growth relate to the structure of the Region. *Spread City* and, to a lesser degree, *Metropolitan Transportation: 1980* envisioned a rather loosely structured metropolitan area stemming from a high growth rate in the outlying suburbs, with population settlement primarily in single-family dwellings. However, the forecast developed by the Regional Studies Section depicts a more closely knit Region with higher densities in the Core and nearby counties, and with more modest absolute growth occurring in the outlying counties.

It should be recognized that the factors which produced the *Spread City* type of growth between 1950 and 1960 are diminishing. The basic rationale underlying the New York Metropolitan Region Study forecast and its revisions was that continued population losses would occur in New York City, following the experience of the 1950-1960 decade, and that the growth in the Regional population would take place in the intermediate and outlying suburban areas.

Comparison of 1985 Regional Population Distributions (22-County Region)

The information available for population changes which have occurred since 1960 does not fall into a pattern which would confirm the validity of this rationale. A consensus of the latest population estimates by county as developed separately by the U.S. Bureau of the Census, Consolidated Edison and the New York City Planning Commission, indicate that population decline in New York City has stopped and, in fact, has been reversed.

The Regional trend of housing construction since 1958 indicates that a larger proportion of the Regional housing stock will consist of multi-family or apartment units. The major share of future population growth which is expected to occur within the Core and the more densely inhabited Inner Ring counties will probably reside in medium and high density housing units. The Outer Ring suburban counties will also continue to show substantial gains in the construction of apartments. As the amount of developable land diminishes throughout the Region, the demand

Projected Percentage of Housing Units in Multi-Family Structures by Urban Zones 1965-1985

for multi-family housing will push hard against existing single family zoning provisions in almost every portion of the Region. Land scarcity and its increasing cost is the key factor in the trend towards multi-family housing, and results from factors such as the rapid increase in households, the major job concentration in the Region's Core and limitations of the commuter transportation network.

Table 4 shows the differences among the various forecasts with respect to the distributions of the projected populations within the Region for 1965 and 1985. Regional Studies Section's estimate for 1965 reveals the incipient trend: New York City's share is larger than that of the other forecasts and the Outer Ring share smaller. By 1985 the contrasts are magnified in line with the assumption adopted in the case of each forecast.

Table 5 presents the historical population series, 1920-1960 by decades, and the forecast by five-year intervals, for the Region and its constituent counties.

Participation of the Region's Population in the Labor Force 1965 and 1985

REGIONAL JOBS: 1965-1985

From the current 1965 estimated base of 7.6 million Regional jobs, an increase of over 1.8 million jobs, a growth of 24 per cent to just under 9.5 million jobs by 1985 is anticipated.

The 1965 to 1985 job growth rate will be somewhat lower than that of population, thus decreasing the ratio of jobs to population.

Table 6

Job Growth in the 23-County Region: 1965 and 1985

	1965	1985	Increase 1965-85 Number	Increase 1965-85 Per cent
Jobs (in thousands)	7,642.2	9,466.3	1,824.1	23.9
Ratio of Number of Jobs to 100 Population	43.0	41.1		

The decline in the Region's job-to-population ratio reflects demographic and socio-economic factors that will influence the national, as well as the Regional job picture during the next 20 years. One basic factor will be not only the greater proportion of people under age 20 in the population, but also their diminishing participation in the labor force in favor of extended education. In addition, economic developments in the Region which would substantially increase the rate of labor force participation of housewives or elderly persons are not foreseen.

The Region's Industrial Structure

Striking differences are expected in the job growth patterns of the Region's industrial sectors over the next 20 years.

As seen in Table 7, government, the service industries, finance-insurance-real estate, and construction will have high growth rates, each with an increase of over 30 per cent in their job totals by 1985. These four sectors will account for almost eight out of every ten new jobs generated in the Region during the forecast period. Wholesale and retail trade will experience moderate growth with increases of about 16 per cent. Job growth in manufacturing and transportation will be under 6 per cent.

The differences in the growth patterns of the Region's industrial sectors will be reflected in the shares of total Regional jobs. The single most significant change will occur in the service industry group, which will supersede manufacturing as the largest single source of jobs. Government, finance and construction will also gain in their shares of the total Regional jobs.

The Geographic Distribution of Jobs

The rate of job growth through 1985 will vary widely among the counties of the Region. Table 8 compares the job

Table 7

JOBS BY MAJOR INDUSTRY GROUP IN THE 23-COUNTY REGION: 1965-1985

growth among the 23 counties of the Region, and Table 9 indicates the change in each county's share of the Region's employment from 1965 through 1985.

The projected county job growth patterns in the Region basically parallel the county population projections. The majority of new jobs within the counties in the Region, except for Manhattan, will service the local population. Thus, the growth in jobs within a county is to a large extent a reflection of the need to provide goods and services for a growing resident population.

Over the next two decades, the New Jersey Sector will show a 36 per cent increase in numbers of jobs, as compared to 18 per cent for the New York Sector. Nevertheless, in absolute terms, the New York Sector, with its large job base, will add 965.4 thousand jobs compared to 742.9 thousand jobs added in the New Jersey Sector from 1965 through 1985.

In New Jersey, Somerset, Morris, Mercer, Monmouth

Jobs in the Metropolitan Region
Per Cent Distribution by Major Industry Group 1965 and 1985

and Middlesex Counties, all in the Outer Ring, will enjoy high job growth rates, with Monmouth more than doubling its employment by 1985. Despite rapidity of growth, these counties as a group will contain only 10.5 per cent of the Region's total jobs in 1985. However, they will account for about 56 per cent of the *new* jobs added in the New Jersey Sector over the next twenty years. Bergen, Passaic and Union Counties, in the Inner Ring, will have more moderate rates of job growth. However, with their large job base in 1965 they will account for about 31 per cent of the new jobs added in the New Jersey Sector through 1985. Essex and Hudson Counties will have relatively low rates of job growth, and will account for the remaining 13 per cent of new jobs projected for the New Jersey Sector.

In the New York Sector of the Region, the Outer Ring counties of Suffolk, Dutchess, Orange, Rockland and Putnam will have high growth rates, and will account for 28 per cent of the new jobs generated in the New York Sector. Nassau and Westchester combined will have relatively moderate rates of growth, but will account for 36 per cent of the New York Sector's new jobs through 1985.

The overall percentage gain in New York City jobs over the next two decades will be comparatively low, 11 per cent. This will result in a decline in New York's share of the Region's jobs from 53.3 per cent in 1965 to 47.8 per cent in 1985. Nevertheless, New York City's absolute increase of 445 thousand jobs over the 4.1 million job base in 1965 will account for 46 per cent of the new jobs in the New York Sector and one out of every four new jobs added in the entire Region over the next twenty years.

Manhattan (New York County), the center of economic activity in the Region, with a third of the Region's jobs in 1965, will have a job growth of only 6.0 per cent during the forecast period. However, its increase of 150 thousand jobs will be the largest absolute gain of any county in the Region.

Comparison of Regional Employment Forecasts

Owing to differences in employment and industry definitions in *Spread City, Metropolitan Transportation: 1980,* and this study, it is possible to compare the respective employment forecasts only in terms of geographic distributions. These are presented as percentage relationships in Table 10.

There is basic agreement among the forecasts concerning the *direction* of change in the relative shares of the Region's jobs by Core, Inner Ring and Outer Ring between 1965 and 1985. The differences are found in the magnitude of the changes. The Regional Studies Section forecast

maintains a somewhat greater concentration of employment in the Core and Inner Ring counties through 1985.

In all three forecasts, the Core will decline in its share of Regional jobs, with relatively little change taking place in the Inner Ring counties share between 1965 and 1985.

The Outer Ring, however, is the area of the greatest relative growth in employment between 1965 and 1985. In all three forecasts, the Outer Ring will greatly increase its share of Regional jobs by 1985. The *Spread City* projection has the greatest share increase, with the Outer Ring commanding 23.8 per cent in 1985 as compared to Regional Studies Section's figure of 20.4 per cent for the same year.

The differences in the 1985 employment distributions between the Regional Studies Section forecast, on the one hand, and those of *Spread City* and *Metropolitan Transportation: 1980,* on the other, stem from differences in the kind of economic growth that was envisioned for the Region. *Spread City* and to a lesser degree, *Metropolitan Transportation: 1980,* foresaw substantial gains in manufacturing employment, the greater part of which would be found in the Inner and Outer Rings. But, growth in manufacturing employment has, to date, not taken place in line with the projected magnitudes, while expansion in non-manufacturing employment in Core and in Inner Ring counties has accounted for the majority of new Regional jobs. The Regional Studies forecast anticipates a continuation of these trends through 1985.

Tables 12 through 20 show the distribution of projected jobs by industry group and by geographic sector of the Region.

Absolute and Per Cent Job Growth in the Geographic Sectors of the Metropolitan Region 1965-1985

SECTION 2

How the Forecasts Were Made

DEVELOPMENT OF THE POPULATION FORECAST

The projection of population represents one of the most critical areas in the structure of an over-all forecast of Regional activity, since population is a key to estimating such factors as employment, housing and land use. These elements, along with population growth, will determine the Region's future development.

Preparation of the Regional Studies Section population forecast involved the development of four inter-related approaches to obtain 1965-1985 population forecasts for the Region and its counties. The first two approaches developed forecasts of Regional population and its distribution by age groups. The third and fourth approaches were concerned primarily with allocating this population growth among the various counties within the Region.

1. Total Population Forecast

The total population forecast for the Region was developed from U.S. Census population projections for Connecticut, New York, and New Jersey. A projection through 1985 was prepared for the share of the Tri-State population expected to reside in the 23-County Region based on historic trend.

The Census Bureau has published a series of alternative projections of individual state populations based on a number of alternative assumptions. These include population redistribution through interstate migration and different rates of natural population increase. The Regional Studies Section, guided by an analysis of the changing demographic composition of both the Region and the nation, elected to use a projection based on Census Series II-B. This assumes a convergence of the gross migration rate of the nation with that of states in the study area and a moderate decline in fertility.

2. Projection of Regional Population by Age Groups

The population forecast by age group involved the development of a model breaking the projected Regional population into age groups and households by five-year intervals through 1985. This data was critical in the development of forecasts of housing, settlement patterns and labor force participation rates. The projection of Regional population age groups and households was based on the relationships of the Region to the nation developed from the 1960 U.S. Census of Population. When applied to the Census Bureau's national projections of population by age group, these Region-to-nation relationships yielded Regional population totals within 3% of the independently arrived at Regional forecast figure reached in the first approach.

3. Forecast of Regional Population Shifts

The forecast of Regional population shifts involved the development and projection of population flows into, out of, and within the Region. This type of analysis is necessary in determining future population settlement patterns within the Region.

The movement of people leaving New York City for suburban counties has been a key element in the redistribution of population growth between the Region's core and suburban areas. The actual quantification of past intra-regional shifts and the estimation of future movements was based on estimates of natural increase and analyses of population flows. The sources for these data were the 1950 and 1960 censuses of Population and Housing, and local sources, such as the *Statistical Guide for New York City* and the *Annual Reports* of the New York City Board of Education.

Suffolk	230,600	274,000	300,000	347,700	380,700

Population projections by county were based on an analysis of core-suburb population flows, changing age composition of the population, projections of housing and settlement patterns, and population projections prepared by utilities and by county, state and other official planning agencies. Population forecasts for each county in the Region were developed by five-year intervals to 1985. The sum of the Region's county projection derived from this procedure tied in closely with the Regional population estimate arrived at using the first approach. The variation for 1985 between the Regional forecast and the sum of county projections was approximately 2 per cent.

4. Household Projections by County

The projections of households and housing units were used in the forecast as a measure, over time, of internal consistency in terms of population distribution by county within the Region. These projections were based on Census Bureau fertility assumptions and unpublished forecasts of the number and average size of households in the nation.

Estimates of the average size of households in the Region for the forecast period were prepared by comparing 1960 relationships for the counties in the Region and the nation. It was assumed that the factors which operated to cause variations in county household size from the national average would continue, though to a diminishing degree, throughout the forecast period.

Estimates of the total number of county housing units were developed by applying a housing vacancy factor to the forecast of households. A vacancy factor for each county was obtained from the 1960 Census of Housing. It was assumed that the county vacancy rates would remain at the 1960 level throughout the forecast period except for those counties whose unusually high vacancy rates were due to the seasonal use of many units. These high vacancy rates are expected to approach the Regional average as increasing land and housing pressures force the conversion of seasonal units within the Region to year-round use.

DEVELOPMENT OF THE JOB FORECAST

The model used by the Port Authority in transportation forecasting requires job projections in considerable geographic and qualitative detail. To fulfill these requirements, three coordinate approaches were utilized in preparing the forecast of jobs by major industry group for the Region and for each of its 23 counties.

1. Forecast of Regional Labor Force and Total Regional Jobs

In this approach the relationships between the Region's present and projected population, labor force and jobs were established. The Region's current and future labor force was estimated by means of the development and application of labor force participation rates, that is, the proportion of a given population that is in the labor force. The current labor force participation rates were derived from the Census of Population.

Based upon probable future economic and social forces in the Region and the nation, Regional participation rates were projected and applied to the population forecast to obtain the Regional labor force. To obtain total Regional jobs from the calculated Regional labor force, it was necessary to make appropriate adjustments to account for current and future persons in institutions, persons in the Armed Forces, unemployed persons, and persons holding more than one job.

2. Forecast of Regional Jobs by Major Industry Groups

The second forecasting approach covered the estimation and projection of the Region's jobs by major industry groups. The first step involved preparing estimates for the 1965 base year for each industry group. Used for this purpose were the employment series of the Bureau of

58

Labor Statistics and estimates derived from Census data on agricultural, domestic, and self-employed workers. This established the 1965 job-by-industry universe. The next step was to project these jobs for each major industry group by five-year intervals to 1985. The sum of the major industry group jobs for each five-year interval was controlled by the forecast of total Regional jobs.

Factors which were taken into account in the projection of jobs among the major industry groups in the Region included historical trends, present economic, social, and demographic patterns and their interrelationships in the future. Particular cognizance was taken of the projected increase in the Region's population, the future relationship of this Region to the nation in terms of types of employment and services performed, and the effect of projected growth of Regional and national incomes as reflected in changes in consumer, business, and government demand for goods and services.

3. Forecast of Jobs by Major Industry Groups for Counties

The third segment of the forecast covered the development of jobs by county and by major industry group. The initial procedure was the development of a 1965 benchmark for each county. It involved combining published employment series and various job estimates to arrive at a 1965 universe by county and by industry group.

Non-agricultural wage and salary job estimates were drawn from the Bureau of Labor Statistics' *Non-Agricultural Establishment Wage and Salary Series;* the employment data published by the Bureau of the Census (based upon Social Security records) in *County Business Patterns;* the *Covered Employment* job data from the New York State Department of Labor on wage and salary jobs reported under the State Unemployment Insurance Law; and the 1962 U.S. Census of Governments. The county estimates of agricultural and domestic jobs for 1965 were derived from the 1960 Census of Population. The 1960 Census of Population was also the basis for estimating and distributing self-employed by industry and county.

Various guidelines were established to distribute the projected Regional totals, developed in the previous approaches, for each of the major industry groups among the 23 counties by five-year intervals in the forecast period.

With the exception of Manhattan, population was the basic guide for distributing jobs in retail trade, finance, services and government among all counties.

The projection of construction jobs in the 23 counties was also related to the provision of facilities for expected population and job growth over the next twenty years.

The projection of jobs in transportation, communications and public utilities in each of the 23 counties was related to past trends and the projected over-all economic activity in the counties.

For the estimate of future manufacturing and wholesale trade jobs, an analysis was made of national and Regional trends in manufacturing and distribution, of the availability of suitable land for future development, and of the present and future transportation networks. An important factor entering in the evaluation of future job growth in manufacturing and distribution in the New Jersey sector, as well as the Region, was the probable large-scale industrial and commercial development of the Jersey Meadows.

Jobs in Manhattan—Particular attention was given to the analysis of key determinants to project future changes in the job structure in Manhattan. Included among these were: the scarcity and high cost of land; the difficulty of transporting and distributing commodities in and through Manhattan; the shift of retail trade and householders' consumer services within the Region; the continued growth of the headquarters and office function and its multiplier effect on business services and other related employment; the greater role of government in the economic and social life of the nation and the Region; increases in Regional and national income; and the development of closer economic and social ties with Europe and the rest of the world.

Proposed Occupational and Vocational-Technical Education Programs for Rhode Island; Rhode Island Vocational Technical Education Development Project.

Columbia Univ., New York, N.Y. Inst. of Field Studies
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Dec65 83p.

*PROGRAM IMPROVEMENT; *PROGRAM PLANNING; PROGRAM DEVELOPMENT; PROGRAM COORDINATION; *VOCATIONAL EDUCATION; *MANPOWER NEEDS; EDUCATIONAL NEEDS; HIGH SCHOOLS; POST SECONDARY EDUCATION; VOCATIONAL SCHOOLS; ADULT VOCATIONAL EDUCATION; EMPLOYMENT PROJECTIONS; OCCUPATIONAL CLUSTERS
RHODE ISLAND

Specific recommendations for programs designed to meet the occupational needs of high school and post-high school students, out-of-school youth, and adults in a society influenced by technological change are presented. Projected labor needs in the State in 11 occupations areas for 1960-70, the potential supply of trained workers from public preparatory programs in the State, and program implications are included. Recommended programs for secondary schools are (1) metal construction and electrical-electronics trades, (2) office and distributive occupations, and (3) others such as agriculture and agriculture-related, cosmetology, industrial drafting, home economics occupations, basic graphic arts, and textiles. Recommended programs at the post-secondary level are (1) chemical, civil engineering and construction, mechanical, electrical-electronics, instrumentation, drafting, and data processing technology, (2) business administration, marketing management, and hotel and resort management, (3) horticulture and landscaping technology, (4) secretarial science, and (5) medical and health science technology. Recommended programs for out-of-school youth and adults are (1) foods trades, (2) manufacturing such as machine tool operator, maintenance mechanic, welder, and assembler, (3) power sewing machine operator, and (4) service occupations such as automobile body and electrical appliance repairmen. Major recommendations presented in five previous reports, recommendations as to future use of the Rhode Island Vocational and Technical School at Corliss Park, and important concepts basic to successful programs are included. FOREWORD

The reader should understand that this is one of a series of reports which have been prepared for the State Board of Education by the Institute of Field Studies, Teachers College, Columbia University. Titles of other reports in the series follow:

- Occupational Education in the Comprehensive High School
- Where Should Occupational Education be Taught at the Secondary Level?
- Occupational and Vocational-Technical Education in the United States
- Present Programs of Occupational Education in Rhode Island
- Rhode Island: Its People and Its Economy
- A Proposed Long-Range Plan for Occupational and Vocational-Technical Education for Rhode Island

This group of documents should be viewed as a single, unified report, the purpose of which is to assist the State Board of Education to plan an expanded and improved program of occupational and vocational-technical education for Rhode Island. Regarded in this manner, each individual report deals with a segment of the problem and may be likened to a chapter in the total report.

This report is important because it spells out specific recommendations for programs designed to meet the occupational needs of high school and post-high school students and of out-of-school youth and adults in a society profoundly influenced by technological change. Recommendations that are basic to this report as well as supportive data and reasoning are provided by other reports in the series.

It will be noted that school enrollment data used in this report are derived from the 1963-1964 academic year. This has been done intentionally because data cited in previous reports have been drawn from that school year. To introduce another base could only be confusing.

No one is omniscient enough to predict the future with certainty. The surest prognosis is continued and accelerated change. The consultants have given careful attention to the probable nature of this change and have recommended programs designed to meet the needs of the future. However, it would be an illusion to view the programs herein proposed, or any others, as final answers. No forecast of the future can assume to be accurate over a long period; consequently, no educational program can be considered static. It is implicit that school officials remain sensitive to change and that programs be kept flexible enough to respond to new developments.

The consultants wish to express gratitude to the staff of the State Department of Education, to the administrative staff of the Junior College, and to officials of the Rhode Island Department of Employment Security. All requests for both general information and specific data were promptly granted.

The consultants also wish to acknowledge the valuable insights and perceptions of the local situations received from these same sources, which were helpful in developing the recommendations of this report.

I. INTRODUCTION: MAJOR RECOMMENDATIONS PRESENTED IN PREVIOUS REPORTS

As indicated in the Foreword, the program suggestions included in this report must be considered within the context of four basic recommendations made in previous reports. These four recommendations may be briefly summarized as:

1. Occupational education at the secondary level should be taught in comprehensive high schools rather than in specialized schools. Education for the world of work cannot realistically be separated from general education, and it is too important to be shunted into a separate compartment. (For full discussion of this recommendation see the reports; Where Shall Occupational Education be Taught at the Secondary Level and Occupational Education in the Comprehensive High School.)

2. A broad choice of occupational curricula should be made available to all high school students of the state. If appropriate programs are not offered in their own school districts, students should have the opportunity to attend "area" comprehensive high schools which offer diversified programs supported by state and federal funds. Recognizing the fact that an enrollment of 1,500 to 2,000 students is usually required to provide a satisfactory range of occupational courses and that many high schools cannot, therefore, justify suitable programs in terms of either numbers or cost, federal legislation (the Vocational Education Act of 1963) provides special financial support for "area" high schools. The State Board of (Vocational) Education should designate "area" schools, which are then entitled to federal assistance for construction or alteration of facilities necessitated by the expansion or improvement of their programs in occupational education. This federal assistance is in addition to federal support of occupational programs, which all schools enjoy. Under the provisions of the Vocational Education Act of 1963, the programs in occupational education offered by an "area" school must be available to all residents of the state or to an area designated by the State Board.

In recommending the establishment of "area" comprehensive high schools, the consultants have also indicated that as a general policy students from other districts should become full-time members of the student body of the "area" high school, as contrasted with attendance on a part-time basis. Tuition should be paid by the home district. (For further details concerning this recommendation, including a list of proposed "area" comprehensive high schools and the areas which they might service, see the report; A Proposed Long-Range Plan for Occupational and Vocational-Technical Education for Rhode Island, pages 21-26.)

3. A strong program of vocational-technical education at the post-secondary level should be developed in comprehensive Junior College - Vocational Technical Centers, rather than in separate technical institutes. The whole spectrum of students' needs at the thirteenth and fourteenth grade levels - both academic and occupational - would then be provided for in unified centers. Furthermore, competing institutions and duplicated facilities would be avoided. To implement this plan, the State Board of Education should enter into a contractual and cooperative agreement with the Board of Trustees for State Colleges for those programs which are designed to prepare students in two years or less for employment in specific occupational fields. In addition to providing the most economical solution this arrangement best serves student interests. (See the report; A Proposed Long-Range Plan for Occupational and Vocational-Technical Education for Rhode Island, pages 27-31.)

4. There should be a massive expansion of vocational and technical programs of short and long term duration to meet the needs of youth who have left school, of youth and adults who suffer from inadequate training, and of adults who require retraining or upgrading. The facilities of high schools, area high schools and Junior College - Vocational Technical Centers should be utilized, especially for late afternoon and evening programs, where they are adequate and when they are in proximity to persons who need their services. In addition, the Corliss Park building should be converted to new purposes, a major one of which should be an adult occupational training center. As such, it should operate both day and evening and offer programs not easily provided elsewhere, as well as apprentice training, MDTA and other government sponsored programs. (See further recommendations in the report; A Proposed Long-Range Plan for Occupational and Vocational-Technical Education for Rhode Island, pages 32-34.)

II. PROJECTED LABOR MARKET NEEDS, PRESENT SOURCES OF SUPPLY, AND PROGRAM IMPLICATIONS

A sound program of occupational education at the state-wide level should be planned to satisfy, insofar as possible, the needs of those preparing for employment and at the same time to serve the requirements of the economy. It becomes necessary, therefore, to anticipate shifts in the patterns of employment, to foresee changes in job requirements, and to measure both the quantity and the quality of the products of existing training programs against probable future employment demands.

The national impact of automation upon the labor force has been discussed in the report; A Proposed Long-Range Plan for Occupational and Vocational-Technical Education for Rhode Island. Trends in the economy of Rhode Island and in its labor force have been explored in the report; Rhode Island: Its People and Its Economy.

The first objective of this report is to examine data that will (1) indicate Rhode Island's probable future needs for labor in representative occupations, and (2) reveal the degree to which present training programs in the state are preparing a supply of labor for those occupations. Such data have program implications; they provide clues to the types of occupational programs that should be offered and, to some extent, how extensively they should be offered.

Estimated Future Need for Labor in Representative Occupations

The first source of data used is that portion of the United States

Census which deals with the characteristics of the population in Rhode Island. A comparison between the numbers employed in selected occupations in 1950 and the numbers employed in 1960 reveals the percentage of change that occurred in each occupation within the ten year period. By assuming that the rate of change will be the same over the next decade and allowing for attrition (deaths, retirements, and other separations), it is possible to estimate the number of new workers who will be needed in each occupation in the 1960-70 period and to reduce this figure to an average number needed per year.

This has been done in Table 1. It must be borne in mind, however, that the past and the present do not always provide accurate forecasts of the future. The experience of the last decade cannot be assumed to be the experience of the next decade. The data must be considered within the context of general trends. Even then, two variables in particular are difficult to predict: the health of the economy and the rapidity with which technological change will affect labor demands in specific occupational fields. Despite these qualifications, this method yields estimates that are as good as any others.

The second source of data used in estimating the future need for labor in specified occupations is a study conducted by the Rhode Island Department of Employment Security titled Manpower Resources in Rhode Island 1962-65. As a part of this study the Department sent questionnaires to a representative sampling of employers in 1960. These employers were asked to estimate the numbers of new employees (exclusive of those in plant training) they would require between 1960 and 1965 to provide for anticipated expansion and replacement needs. The study covers a group of selected occupations. Results

Source: Compiled from data in U.S. Census of Population, 1960.
Rhode Island - Characteristics of the Population, Table 120.
Projections assume same per cent change in 1960-70 as in 1950-60.
Attrition rates: 2 1/2 per cent per year for men; 5 per cent per year for women.

are shown in Table 2.

This method of projecting future labor needs is totally different from the method which utilizes census figures. It is not surprising then that it shows somewhat differing results. Like the census method it has shortcomings. It must rely upon the judgment of individuals who are called upon to predict trends within their own companies as well as general business trends. This fact is made clear by the Department of Employment Security in its study and in subsequent bulletins. Predictions of occupational needs derived in any manner are only approximate.

One additional piece of information relating to needs for labor in specific occupations is worth considering. In October 1965, the Department of Employment Security released to the consultants a list of occupations which the Department then considered in short supply of labor. This list appears in Table 3.

Since no highly accurate prediction of labor needs is possible, indications taken from past employment experience in Rhode Island (Table 1) and from careful projections by Rhode Island employers (Table 2) plus a current appraisal (Table 3) seem, if viewed in the light of anticipated trends, to provide the basis for judgments necessary to program planning.

Potential Supply of Trained Workers in Various Occupational Fields

Consideration has been given to the labor needs of various occupational fields. In order to determine to what extent programs of occupational education are required, it is necessary to measure these needs against the

TABLE III

SELECTED OCCUPATIONS CONSIDERED IN SHORT SUPPLY OF LABOR BY THE DEPARTMENT OF EMPLOYMENT SECURITY OCTOBER 1965

Agricultural-Related Occupations

- Nurseryman

Foods Occupations

- Baker (all-round)
- Baker (helper)
- Cook (hotel and restaurant)
- Cook (restaurant, short order)
- Cook's Helper
- Waitress (restaurant)
- Counterman, Countergirl
- Kitchen Helper (hospital)

Manufacturing Occupations

- Automatic Screw Machine Operator
- Machine Tool Operator (general)
- Milling Machine Operator
- Turret Machine Operator
- Silk Finisher and Presser
- Weaver

Medical and Health Occupations

- Dental Assistant
- Hospital Orderly
- Hospital Janitor
- Hospital Maid (ward)
- Hospital Nurse's Aide
- Hospital Clerk-Typist (medical terminology)

Needle Trades Occupations

- Seamstress
- Slipcover Seamstress

Office Occupations

- Clerk-Typist
- Clerk-Stenographer
- Secretary

Personal Service Occupations

- Dry Cleaner and Spotter

Technical Service Occupations

- Automobile Body Repairman
- Automobile Body Repairman (helper)
- Automobile Service Station Mechanic
- Electrical Appliance Serviceman
- Loom Fixer
- Welder

Technician Occupations

- Draftsman (architectural)
- Draftsman (mechanical)
- Draftsman (structural)

Source: Rhode Island Department of Employment Security

numbers being prepared to fill them. This is the raw material for the judgment of whether a given program should be offered and if so, how extensively it should be offered.

Table 4 shows the numbers who were prepared for various occupational fields by public programs in the school year 1963-1964.

Implications for Programs in Occupational Education

The remainder of this section is devoted to implications for specific programs of occupational education as seen by the consultants after analysis of the data presented in Tables 1,2,3,and 4. Program developments in other states and national employment trends have also been considered.

As used in the following material, Labor Market Needs refers to the need for employees in the particular occupation under discussion; Potential Labor Supply means the labor supply that may be expected from existing training programs. Enrollment data are for the 1963-1964 school year.

Agricultural - Related Occupations

Farmer

Labor Market Needs:	Decreasing numbers are required annually. This is a national trend and very marked in Rhode Island.
Potential Labor Supply:	Nearly 500 students are enrolled in high school programs; there are an estimated 110 graduates each year.
Program Implications:	The demand does not match the supply in general farming. Occupational programs to prepare for allied occupations should be considered. See Farming-Related.

TABLE IV

POTENTIAL SUPPLY OF TRAINED WORKERS FROM
PUBLIC PREPARATORY PROGRAMS IN RHODE ISLAND
1963-1964

Occupations	Apprenticeship		Full-time Day Programs		Cooperative Programs		MDTA	Total

Note: Data in the above table do not include students enrolled in business education programs in the high schools which formerly were not subsidized by federal funds, persons trained in private business and trade-technical schools, and workers trained within industry.

Source: Rhode Island State Department of Education.

Farming-Related

Labor Market Needs: Tables 1 and 3 indicate a demand for gardeners, groundskeepers and nurserymen. Higher standards of living plus beautification of public buildings and highways make this an expanding occupational field.

Potential Labor Supply: No specific programs are offered.

Program Implications: Some high school programs in general agriculture should be converted to preparation for gardeners, nursery employees, landscaping assistants, florists, etc. At the post-secondary level programs for landscape architects, nurserymen, greenhouse operators, etc., should be provided in the Junior College - Vocational Technical Centers.

Construction Occupations

Woodworker

Labor Market Needs: Tables 1 and 2 show a moderate demand for carpenters and cabinetmakers.

Potential Labor Supply: Seven high schools offer programs; there is also an apprentice program. Total annual output is estimated at 79. This figure exceeds estimates of need.

Program Implications: Placement records of woodworking programs should be watched. Content of the programs should be expanded to include wood finishing and possibly boat building.

Painter

Labor Market Needs: The needs appear small; Table 1 estimates 15 per year.

Potential Labor Supply: Two high schools offer programs in painting and decorating with an estimate of 8 graduating. There are also 31 apprentices in more specialized sign construction and painting with an estimate of 8 completions per year.

Painter (continued)

Program Implications: Present programs should be continued only if placement records are satisfactory.

Plumber - Steamfitter

Labor Market Needs: Tables 1 and 2 indicate a comparatively small need.

Potential Labor Supply: There are no high school programs. Training is handled through apprenticeships. There are an estimated thirty completions per year.

Program Implications: The apprentice program apparently meets the needs. There is no reason to organize a high school occupational program.

Mason

Labor Market Needs: Table 1 indicates 12 per year as bricklayers and plasterers.

Potential Labor Supply: There are no high school programs. Training is handled through apprenticeships. There are an estimated 3 completions per year.

Program Implications: If the apprentice program does not meet the needs, encourage more applicants. No formal high school program should be organized.

Foods Occupations

Baker, Cook

Labor Market Needs: There is a heavy demand and evidence that restaurant and hotel bakers and cooks are in short supply.

Potential Labor Supply: There are no organized training programs.

Program Implications: Programs should be developed as part of a larger food trades program in an adult occupational training center.

Meat Cutter

Labor Market Needs: There is a moderate demand. Table 1 estimates 36 needed per year.

Potential Labor Supply: No organized programs are available.

Program Implications: A course should be developed as part of a larger food trades program in an adult occupational training center.

Waiter, Waitress, Counterman

Labor Market Needs: The demand is heavy. These occupations are in short supply of labor.

Potential Labor Supply: No organized programs exist.

Program Implications: Short term courses should be included as a part of a larger foods trade program in an adult occupational training center.

Manufacturing Occupations

Machinist-Toolmaker

Labor Market Needs: Table 1 estimates 27 machinists and 16 toolmakers needed per year. Table 2 indicates 27 machinists and 24 toolmakers.

Potential Labor Supply: Training is done in apprentice programs operated by industry.

Program Implications: The apprentice program should be continued by industry.

Machine Tool Operator

Labor Market Needs: There is a heavy demand for general machine tool operators and for operators of turret lathes, milling machines, and automatic screw machines. A short supply of labor is indicated.

Potential Labor Supply: Approximately 103 high school students are graduated from machine shop programs. In addition, 228 were trained in MDTA programs in 1963-1964.

Machine Tool Operator (Continued)

Program Implications: High school machine shop programs should be expanded and care given to quality preparation. MDTA programs should be continued at adult occupational training center. Other evening adult programs should be offered at well equipped area comprehensive high schools as the need requires.

Maintenance Mechanic

Labor Market Needs: Large numbers are needed. This is a growing occupational field.

Potential Labor Supply: There are no organized programs for this specific purpose.

Program Implications: Programs of broad basic character should be introduced as program clusters in area comprehensive high schools. (Program clusters are commented upon later in this report.) One unit should be small engine repair. A program should also be organized for adults in an adult occupational training center.

Welder

Labor Market Needs: The demand for welders is relatively heavy. Table 1 estimates that 68 are needed per year. There is evidence that they are in short supply.

Potential Labor Supply: Incidental training is available, but there is no organized program in welding.

Program Implications: In high school occupational programs welding should be considered as a service to other occupations and included in basic training. Adult courses should be offered in an adult occupational training center and in evening sessions at area comprehensive high schools as the need requires.

Jeweler, Watchmaker, Silversmith, Goldsmith, Solderer, Ringmaker

Labor Market Needs: There is a moderate demand.

Jeweler, Watchmaker, Silversmith, Goldsmith, Solderer, Ringmaker (Continued)

Potential Labor Supply: No organized programs are offered.

Program Implications: If the demand increases or there is evidence of a short supply of workers, the possibility of a training program of broad scope for adults should be studied.

Sheetmetal Worker (also in Construction Occupations)

Labor Market Needs: Table 1 estimates that 19 are needed per year; Table 2, that 5 are needed per year.

Potential Labor Supply: Apprenticeship produces about 10 per year. There are programs in two high schools which graduate about 14. In addition MDTA produced about 20 in 1963-64, making a total of 44 prepared that year.

Program Implications: Present programs should be continued, as long as placement records are satisfactory. The MDTA program can be dropped if the need for it no longer exists.

Pattern Maker, Molder

Labor Market Needs: The numbers needed do not appear to be large.

Potential Labor Supply: There are no organized programs.

Program Implications: Further investigation is called for. The equipment is expensive for the numbers to be trained. If foundry practice is introduced, patternmaking should accompany it. Otherwise, apprentice training may be the best solution.

Printer

Labor Market Needs: Table 1 estimates that 39 compositors and 16 pressmen are needed per year. Table 2 estimates that 14 new employees are required annually in the printing occupation.

Printer (Continued)

Potential Labor Supply:	About 43 are graduated from high school programs each year. There are no enrolled apprentices but the International Typographical Union has a correspondence program. Equipment in the schools is not generally good and offset processes are not provided for.
Program Implications:	At the secondary school level printing should be continued as a broad program basic to the graphic arts and without specialization. Basic offset processes should be included in the program. At the post-secondary level programs in the graphic arts including managerial aspects should be considered in the Junior College - Vocational Technical Centers.

Assembler

Labor Market Needs:	There is a fairly heavy demand with seasonal variations for assemblers. The jewelry industry requires many women.
Potential Labor Supply:	There is no organized program of preparation.
Program Implications:	No school program should be introduced since this is a semi-skilled job. MDTA programs can be operated at the adult occupational training center as needs require.

Medical and Health Occupations

The national trend is a rapid expansion in all medical and health occupations. Increased emphasis upon health including governmental health programs for the aged has created a national shortage of trained workers. At the same time mounting specialization in medicine and dentistry accompanied by new laboratory techniques has resulted in growing demands for medical and dental technicians. Comparison with other states shows that Rhode Island is

far down the list in preparing persons for medical and health occupations.

(See the report Present Programs in Occupational Education in Rhode Island, pages 12-15.)

Professional Nurse

Labor Market Needs:	Many professional nurses are needed; Table 1 estimates 246 per year.
Potential Labor Supply:	Not known.
Program Implications:	There is a marked trend toward two-year college or university training for nurses. Junior Colleges throughout the country are developing nursing programs. The Junior College-Vocational Technical Centers should offer such a program.

Practical Nurse

Labor Market Needs:	Practical nurses are also in short supply. It appears that at least 151 and probably more are needed per year in Rhode Island.
Potential Labor Supply:	The Rhode Island School of Practical Nursing enrolls about 100.
Program Implications:	The Rhode Island School of Practical Nursing should be incorporated into a larger program in one or more of the Junior College-Vocational Technical Centers.

Medical and Dental Laboratory Technicians

Labor Market Needs:	The demands for sub-professional medical and dental assistants are increasing rapidly and are not being met.
Potential Labor Supply:	There are no organized programs.
Program Implications:	Preparation should be assumed by the Junior College-Vocational Technical Centers.

Medical and Dental Assistants

Labor Market Needs:	General assistants capable of a variety of duties, some of which border on the sub-professional, are in short supply. Secretaries and typists trained in medical terminology are also needed.
Potential Labor Supply:	A small number are enrolled in a cooperative program preparing medical secretaries in Cranston East High School.
Program Implications:	Basic preparation for typists with some knowledge of technical terms can be given in high school programs. More advanced training for medical secretaries and preparation for sub-professional knowledge and skills such as required for dental hygienist should be placed in the Junior College-Vocational Technical Centers.

Needle Trade Occupations

Dressmakers, Seamstresses, and Tailors

Labor Market Needs:	There is a steady and moderate demand for dressmakers and tailors. Seamstresses appear to be in short supply.
Potential Labor Supply:	There are about 10 high school graduates per year in dressmaking.
Program Implications:	The high school home economics specialist should develop further programs in this field as permitted under the Vocational Education Act of 1963. Training for power sewing machines might be provided for girls in a large area comprehensive high school. A program for adult women should be operated in an adult occupational training center.

Office Occupations

General Office Workers

Labor Market Needs:	All evidence points toward heavy demands for bookkeepers, office machine operators, secretaries, stenographers, typists, and clerks.
Potential Labor Supply:	Large numbers are enrolled in occupational or semi-occupational high school business programs. There are also several private business schools.
Program Implications:	High school programs should be continued and improved where possible. That phase of of the program which deals with business machines requires the continual acquisition of newly developed machines. Advanced programs should be placed in the Junior College-Vocational Technical Centers.

Data Processing-Programmer, System Analyst, Machine Operator

Labor Market Needs:	Data processing is one of the most rapidly growing occupational fields in the nation. There is, consequently, a marked need for trained personnel.
Potential Labor Supply:	There are no public training programs.
Program Implications:	One or more training centers for business and technical data processing should be planned in the Junior College-Vocational Technical Centers. Ancillary training programs should be introduced in area comprehensive high schools.

Personal Service Occupations

Cosmetologist

Labor Market Needs:	Cosmetology is a developing occupation. Table 1 estimates that 100 new employees are needed per year.

Cosmetologist (Continued)

Potential Labor Supply:	There are no training programs operated at public expense. There are, however, several proprietary schools.
Program Implications:	Cosmetology is being introduced into high school occupational programs in other states. Programs should be developed in two or more of the area comprehensive high schools situated in population centers.

Laundryman, Dry Cleaner, Spotter

Labor Market Needs:	The whole area of personal service is experiencing national growth. There appears to be some shortage of labor in these fields.
Potential Labor Supply:	No organized training programs exist.
Program Implications:	MDTA programs should be developed if needed at an adult occupational training center.

Distributive Occupations

Salesmen and Saleswomen

Labor Market Needs:	Table 1 estimates 340 retail salesmen, 120 wholesale salesmen, and 61 manufacturing salesmen needed per year. Salesmen and saleswomen are usually in demand in an expanding economy.
Potential Labor Supply:	In 1963-1964, 63 girls (no boys) enrolled in high school cooperative programs.
Program Implications:	High school offerings, including cooperative programs, should be greatly expanded especially in populous areas. Approximately one-half of the enrollment in these programs should be boys. Advanced programs in merchandising and management should be operated by the Junior College-Vocational Technical Centers.

Technical Service Occupations

Automobile Body Repairman

Labor Market Needs:	Increasing numbers of automobiles and congested traffic lead to substantial demands. The Department of Employment Security reports a short supply.
Potential Labor Supply:	In 1963-1964, 15 completed an MDTA program.
Program Implications:	Training should be provided in an adult occupational training center.

Automobile Mechanic

Labor Market Needs:	The demand appears to be moderately heavy with a present shortage of service station mechanics.
Potential Labor Supply:	A large number are being trained. About 90 are being graduated per year from high school programs. MDTA programs are also operating. A total of approximately 150 are entering the labor market annually.
Program Implications:	Present high school programs should be continued. Better facilities and equipment should be provided in area comprehensive high schools.

Electrician - Electrical Appliance Serviceman

Labor Market Needs:	Table 1 estimates that 42 electricians are needed per year, many of them in the construction field. Table 2 estimates only 7 needed per year. The Department of Employment Security includes electrical appliance servicemen in its list of occupations now in short supply of labor.
Potential Labor Supply:	High school programs are graduating about 40 students per year from their programs in electricity. Apprenticeship adds another 9 or 10. In addition the high schools are preparing about 35 per year in electronics.

Electrician-Electrical Appliance Serviceman (Continued)

Program Implications: A cluster program designed as general preparation for the electrical-electronic trades including small appliance repair should be developed in high schools. At least one evening adult program in appliance repair should be provided at an adult occupational training center or at an area comprehensive high school.

Radio and Television Repairman

Labor Market Needs: Table 1 estimates 21 per year.

Potential Labor Supply: About 35 high school students are being graduated from electronics programs.

Program Implications: High schools should develop a cluster program as general preparation for the electrical and electronic trades including radio and television servicing.

Technician Occupations

Electronic, Electrical, Engineering Technicians and Draftsmen

Labor Market Needs: Technology and automation including the trend toward scientific and engineering "teams" have created heavy demands for technicians or subprofessional workers in various fields. No need is more important to the nation's developing economy and no field offers greater opportunity for young people. Table 1 estimates 212 technicians needed per year in electricity and electronics and 137 needed per year in engineering and science. The estimates are probably low. The Department of Employment Security reports architectural, mechanical, and structural draftsmen in short supply.

Potential Labor Supply: In September 1965, the Rhode Island Junior College established programs in chemical, electronic, and mechanical technology.

Electronic, Electrical, Engineering Technicians and Draftsmen (Continued)

Program Implications: The Junior College programs just established should be vigorously pushed and preparation in other technologies should be added to the program of the Junior College-Vocational Technical Centers

III. OCCUPATIONAL EDUCATION IN THE SECONDARY SCHOOLS OF RHODE ISLAND

General guidelines for a modern program in occupational education at the high school level, as seen by the consultants, will be found in the report, A Proposed Long-Range Plan for Occupational and Vocational-Technical Education for Rhode Island, pages 17-19.

The specific program recommendations that follow are based upon the general needs of youth, the implications derived from the study of the Rhode Island labor market in the preceding section of this report, and the national trends in occupational education. It is not intended that any one high school should offer all the recommended programs. Some large area comprehensive high schools should offer most of the list; certain small high schools will be able to justify only very limited offerings.

It will be noted that some of the recommended programs are divided into related groups or clusters. These clusters have educational significance, which is commented upon later.

Recommended Programs in Secondary Schools

1. Trade and Industrial Programs

a. Metal Trades

(1). Machine Shop
(2). Automobile Mechanics
(3). Small Engine Repair

1. Trade and Industrial Programs (Continued)

b. Construction Trades

(1). Carpentry
(2). Electric Construction
(3). Sheet Metal Work
(4). Painting and Decorating

c. Electrical-Electronics Trades

(1). Electrical Wiring
(2). Electrical Maintenance
(3). Radio-T.V.Servicing
(4). Small Appliance Repair

2. Office and Distributive Programs

a. Office Occupations

(1). Stenography
(2). Bookkeeping
(3). Office Practice
(4). Basic Data Processing

b. Distributive Occupations

(1). Salesmanship

3. Other Programs

a. Agriculture and Agriculture-Related
b. Cosmetology
c. Industrial Drafting
d. Home Economics-Occupations for Women
e. Basic Graphic Arts
f. Textiles

The Cluster Concept of Program

Programs listed under Metal Trades, Construction Trades, Electrical-Electronics Trades, and Office Occupations are grouped as clusters. The cluster concept implies a broad general base of preparation with specialization deferred

insofar as possible until the 12th grade. Changing job requirements have made it less desirable for students to start specialized skills too early. New occupational demands emphasize competencies such as understanding and judgment, rather than manipulative skills. Programs at high school level should be designed to develop general background and knowledge plus those skills that will enable youth to obtain initial employment but which will also provide a base for further learning through apprenticeship or extension programs. Clusters are devised for occupations closely enough allied to warrant common instruction in basic skills and knowledge with specialized laboratory and shop work deferred to Grade 12.

To illustrate, preparation for three Trade and Industrial clusters would include the following basic subject matter given in appropriate sequence before Grade 12:

Metal Trades

Exploratory shop with a period of time for basic experience in machine shop, auto shop, sheet metal shop, and welding.

Basic metal-forming processes including machining, cutting, forging, and casting.

Materials and their properties including ferrous and non-ferrous materials. Related to applied physics. Some experience with simple testing machines.

Blueprint reading for machine work, welding, basic electrical circuits, and sheet metal.

Mathematics with application to the metal-working field including applied arithmetic, basic algebra, and necessary phases of elementary trigonometry.

Applied Physics in both classroom and laboratory using very practical principles of physics.

Construction Trades

Exploratory shop with a period of time for basic experience in such shops as carpentry, sheet metal, electrical, and if available, masonry and painting.

Materials of construction, their properties and strengths taught with relationship to applied physics.

Blueprint reading related to architecture.

Drafting related to architecture.

Mathematics with application to the building trades including applied arithmetic and applied geometry.

Applied Physics in both classroom and laboratory using very practical principles of physics pertinent to construction.

Electrical-Electronic Trades

Shop Practice emphasizing bench work, the use of hand tools, test instruments, etc.

Blueprint reading in mechanical and electrical areas.

Drafting in mechanical and electrical areas.

Mathematics with application to electricity including arithmetic, basic algebra, and simple elements of trigonometry.

Applied Physics with emphasis on electrical theory.

Basic electric laboratory for application of electrical theory to practical use.

In grade 12 the student who will terminate his education upon graduation from high school should specialize sufficiently to give him a saleable skill in the occupation of his choice. Up to half his school day should be spent

in the appropriate shop or laboratory and in related mathematics and science.

Placement of Programs

As previously stated, it is not proposed that any one school offer all the recommended programs. Certain large high schools designated as area schools will offer the greatest diversity. For instance, the area high schools in the Blackstone Valley might consider the entire list with the exception of agriculture. Providence might do the same but probably should exclude textiles as well as agriculture. In order to ascertain the number of programs that can be offered in other area high schools, careful studies should be made of (1) the occupational needs of the population in the area, and (2) the probable enrollment in each occupational program.

Small high schools, not designated as area schools, should continue their present programs and improve them. Usually they can offer programs in home economics and office occupations. If enrollments justify, small high schools may in some instances add instruction in the use of tools in various types of mechanical maintenance. However, the role of the high school of under a thousand students is limited in occupational education. Such schools should utilize the area comprehensive high schools for students whose needs they cannot meet.

Certain programs are best placed in particular environments. For instance the textile program belongs in the Blackstone Valley. Cosmetology, retailing and graphic arts are best placed in the populous centers. There is, however, a caution. The immediate environment cannot be the sole criterion

for program placement. Rhode Island is a small state; workers both commute and migrate. Furthermore, place of residence should not deprive youth of opportunity. Therefore, programs for which there is a recognized demand in the labor market can justifiably be placed in area comprehensive high schools located outside the apparent logical environment for such programs.

The preceding section of this report, Projected Labor Market Needs, Present Sources of Supply, and Program Implications, provides clues to the numbers of students who should be prepared in the state for a given occupational field and, therefore, to the number of schools that should offer a preparatory program. For instance, textiles should not be offered beyond the Blackstone Valley. It is difficult to justify carpentry and woodworking programs in seven schools unless the occupations for which they prepare are expanded and placement of graduates is satisfactory. Agriculture, now offered in nine schools, presents the same problem.

Recommendations in Particular Program Areas

Programs in Distributive Education

Increase in emphasis on distributive education is important in Rhode Island. Although, the percentage of workers in the sales field is rising in the state, little preparation is offered. In 1963-1964, programs were conducted only in Providence and Cranston and enrolled a total of 63 twelfth grade students - all girls. Figures comparing this enrollment with that of neighboring states in 1962-1963 are shown on the following page.

Enrollment in Cooperative Distributive Education Programs
in Selected States -1962-63 *

	Female	Male	Total	Per Cent Female
Connecticut	183	141	324	56
Massachusetts	189	216	405	47
New Jersey	321	298	619	52
New York	3,664	4,030	7,694	48
RHODE ISLAND	52	0	52	100

*Source: Vocational and Technical Education. U.S. Office of Education. Bulletin OE 80008-63.

In the United States as a whole in 1962-63, only 45 per cent of the students enrolled in cooperative distributive education were females.

It is strongly recommended that there be a substantial increase in distributive education and also that boys be encouraged to select the program.

Programs in Office Occupations

Programs in office occupations (sometimes called business education) were not federally reimbursable until the Vocational Education Act of 1963 became effective. Since the State Department of Education in Rhode Island must yet define what constitutes a reimbursable program, exact figures of the numbers of students who are actually preparing for employment in stenography, typing, office and clerical work are not available. However, visits to the various high schools of the state by the consultants indicate that the numbers enrolled in one or more courses in office occupations are large (approximately 20,000 in grades 10,11, and 12). All high schools visited (except the strictly vocational schools) operated programs in office occupations. Facilities and

equipment range from excellent to meager; however, it is interesting to note that the consultants rated the equipment in more than one-third of the schools as excellent.

Rhode Island is not neglecting education for office occupations, however, more attention to the area is justified. In Rhode Island during the 1950-60 decade, the percentage increase in employed workers in this field (including typists, stenographers, office and clerical workers) was second only to the percentage increase among the professional and technical workers. Well devised programs should be encouraged.

The following recommendations seem in order:

1. The business machines equipment and programs require improvement in many schools. New machines designed for bookkeeping, calculating, duplicating, and communicating are playing an increasingly important role in office practice.

2. Basic data processing, such as preparation for key punch operator, should be introduced at least into the larger schools in urban centers.

Cooperative Part-time Programs

The development of more cooperative part-time work programs in Rhode Island at the 12th grade level is strongly recommended. In these programs the student spends half of the school day at a paid job in business or industry and the other half-day in school. He works under the direction of a school coordinator, who arranges the necessary relationships with business or industrial firms. The coordinator places students in job situations related to their fields of study, maintains contact with employers, and generally supervises the students in

their work experience. He meets with students for one class period each day.

Such supervised work experience is considered excellent preparation for initial job entry. The general plan of combining study with work experience is not a new one and has found favor not only among high schools but also a growing number of colleges which employ the same concept in various ways. The actual experience in the world of work makes school preparation meaningful and helps to develop attitudes acceptable to business and industry. Cooperative programs are adaptable to the office and clerical fields, to retailing, to graphic arts, and to many of the trade and industrial fields.

The programs in distributive education already mentioned are cooperative but too limited in numbers. In 1963-64, the State Department of Education reported 102 students in trade and industrial cooperative courses. These programs were operated in four schools: Central Falls, Pawtucket, Providence, and Vocational Technical. Enrollment by occupational fields was as follows:

Machine Shop	33
Auto Mechanics	32
Printing	13
Woodwork	9
Electricity	7
Sheet Metal	6
Textiles	2
	102

The consultants believe that it is important to expand cooperative education to other occupational fields and to all schools in Rhode Island where the student body is sufficiently large and arrangements with business and industry can be made.

Twelfth Grade Course in Industrial Economics and Labor Relations

Every student planning to seek employment following high school graduation should be given subject matter related to industrial economics and labor relations in the 12th grade. Students should have a healthy concept of our free enterprise system, of how business and industry operate , and of other basics of our economy. Students should also understand the elements of organization within business and industry, labor-management relations, unions, and collective bargaining. They should see the function and responsibility of both management and labor in our economy. Such a course at 12th grade level could obviously deal only with basics and should be acceptable to both labor and management. For students who will continue their education beyond the high school, it would be wise to defer this content to the post-high school institution where it can be taught at a more sophisticated level.

Programs Preparing for Vocational-Technical Education at Post-High School Level

Discussion to this point has been centered around occupational programs for students who will leave school upon their graduation from high school. However, the high school also bears a heavy responsibility for preparing students to continue their occupational education at the 13th and 14th grade levels. With the development of the Junior College - Vocational Technical Centers, large numbers of students should be encouraged to seek additional education in preparation for jobs at the technical or sub-professional level. This development is vital to Rhode Island. Programs suggested for inclusion at the Centers are enumerated in the section of this report dealing with post-high school vocational-technical programs.

Many students who will pursue vocational-technical programs at the 13th and 14th grade levels will undoubtedly come from high school programs preparing for four-year colleges. These will be students whose goals are altered for economic or academic reasons. Others will come from high school programs in general education. However, the high schools should plan programs designed as preparatory to terminal programs of vocational-technical education at the Junior College - Vocational Technical Centers. A large segment of the students (60 per cent), who presently leave school upon graduation are condidates for this type of program.

A basic principle to be observed is to give all students as much general education as possible. Specialized preparation should be deferred as long as feasible. This principle is clearly in operation in the colleges, which tend more and more to devote undergraduate preparation to the liberal arts and to rely upon the graduate schools for specialized education.

As applied to high school students who will pursue vocational-technical education at the 13th and 14th grade levels, this principle means that they should be given less shop and laboratory work and more general education than students who must be prepared for immediate job entry upon graduation. English, social studies, and some form of mathematics, and science are required of both groups. Those who are continuing with their education should have the opportunity to add foreign language, benefit from music and art, and, very important, study mathematics and science in greater depth. Their programs should be arranged accordingly.

On the other hand, some exposure to shop and laboratory work related to their occupational interests will be valuable and in many instances necessary for these students. For instance, those electing a mechanical technology will profit from exposure to appropriate shops and mechanical drafting. Those preparing for the graphic arts will require a basic knowledge of printing. Girls going on to advanced secretarial skills will need basic typing and stenography.

Obviously the programs under discussion must provide emphases on the subjects that might be considered pre-requisites. The engineering technologies, for example, require a high school background in mathematics, physics, and drafting. Nursing education demands a knowledge of chemistry. Horticulture implies a background in chemistry and earth science. The high schools and the Junior College - Vocational Technical Centers will need to agree upon the basic requirements deemed necessary for success in post-secondary programs.

A point of considerable importance centers around the fact that a certain number of students enrolled in terminal occupational programs in the high schools will show themselves sufficiently proficient to warrant further education in the Junior College - Vocational Technical Centers; yet their preparation especially in the mathematics and science areas may be too weak for probable success. It has been repeatedly said that interest and aptitudes of teen-agers change. "Openendedness" must be preserved; those who are capable must not be "frozen into" an organizational straight jacket that precludes further education. If the high school records and developing aptitudes of students indicate a capacity to pursue work at the 13th and 14th grade levels, such students should be encouraged to continue. Provisions should be made, preferably at the Junior College-

Vocational Technical Centers, for them to make up their deficiencies. The numbers of such students may not be large, but the principle is important.

Recommendations Related to Program

The guidance function is vital to occupational education. Unfortunately most guidance counselors are not well prepared in the vocational area. Few have had trade or industrial experience. Furthermore, the counselors have been primarily engaged in personal, academic, and college advisement. Realistically, it is too much to expect that a general counselor will have the employment background, knowledge, and contacts to make him a competent vocational counselor. This fact poses a problem in many schools.

The most practical solution is specialized vocational counselors who know job requirements, job opportunities, labor trends and other information requisite to intelligent guidance of students in occupational programs. Such counselors should maintain close contact with employers in important areas of business and industry. They should also maintain close contact with the Junior College - Vocational Technical Centers.

Vocational Counselors should not operate independently, but should relate themselves to other counselors who are handling academic and college advisement, thus creating a kind of school guidance team. It is recommended that a student in occupational education be assigned to the same counselor for his entire high school career.

Counseling for summer employment is an area in which vocational guidance officers can make a valuable contribution. Work experience during

vacation periods offers some of the advantages inherent in cooperative and work-study programs, provided that students are placed in situations related to their field of study. Maximum values would be achieved if area comprehensive high schools offered summer placement service and if vocational counselors were employed during the summer to maintain contact with employers. Obviously such an effort must be governed by state labor laws specifying ages at which youth can be employed.

In their conversations with Dr. Grant Venn, author of Man, Education and Work, and Superintendent of Schools in Parkersburg, West Virginia, the consultants were impressed with the values which he has observed in after-school and summer employment under general school supervision in Parkersburg. Dr. Venn also suggests that report card grades be given in the area of work experience. In many instances, grades earned on-the-job are higher than those which the student can achieve in school, consequently providing both satisfaction and incentive.

In area comprehensive high schools active placement service for graduates of occupational programs is a necessity.

Potential Drop-Outs

Drop-outs constitute one of the more serious problems with which schools contend. It is estimated that one out of every three of the boys and girls who leave school before high school graduation is unemployed.

Students leave before they finish high school for varied and complex reasons. One factor, however, appears to remain constant; they want to be

associated with the world of work. For this reason, occupational education at the high school level must be gravely concerned with the problem of drop-outs.

There is no panacea. A program to induce potential drop-outs to remain in school cannot be molded into a simple pattern. Although difficult to achieve, the high school must make serious efforts in the following directions:

1. early recognition of potential drop-outs through alert guidance,
2. remedial programs especially in reading and arithmetic,
3. ungraded classes for certain groups of students,
4. special programs, some of unorthodox nature, in the various shops that will hold the interest of non-academic students,
5. use of the work-study plan included under the Vocational Education Act of 1963, for those students who are under financial pressure. Employment of these students in the school store, the office, the food services, and the maintenance operation serves the additional purpose of providing them with the feeling that they have a place in the school setting.

It is unlikely that any effort will eliminate all drop-outs. Viewing the matter realistically, some pupils will continue to leave school before graduation. The high schools must do the best they can for this group. Two suggestions seem pertinent:

1. that students intending to leave school be induced to take some form of specific occupational training before they terminate, even though the instruction is relatively scanty and of short duration. The object is to give them as much marketable skill as possible,
2. that students who drop out be encouraged to return to school or at least to continue with some type of education at a later date. In this connection Professor Donald E. Super of Teachers College, Columbia University, made a study which followed the careers of drop-outs over a period of years in Middletown, New York. He discovered the following:

140 students entered grade 9
37 dropped out before high school graduation

103 or 74 per cent of those who entered grade 9 completed high school, but

15 of the drop-outs later received high school diplomas or the equivalent, hence

118 or 84 per cent completed high school work within two years after the class was graduated

It is difficult to get accurate information on drop-outs, but this study lends credence to the fact that many subsequently realize their educational deficiencies and wish to remedy them. It also argues for encouraging these students to return to school or to take extension courses at a later date.

It is encouraging to note, that the percentage of students who leave high school before graduation is decreasing. The goal is to reduce the numbers as much as possible. Occupational education is vitally important to the effort.

Education for Change

The rapidity of change and the pace of advancing technology create painful problems for educators. What do you educate for? A product, a process, a skill, or even an occupation may be completely obsolete within a few years. It is commonly acknowledged that workers ranging from the semi-skilled to the professional will require retraining several times during their lives. If they are to survive, workers must become adaptable; they must be educated for change itself.

Whereas there are no pat answers, there are two implications. One pertains to the content to be taught and the other pertains to attitudes that must be developed.

Relative to content, the only sensible course is to keep subject matter as broad and as basic as possible so that it will serve as a foundation for change. This report therefore suggests a broad base for each program cluster in occupational education with specialization deferred as long as possible. The base should retain value though the specialization changes.

Relative to developing student attitudes that prepare the individual for change without devastating results, it seems sound to emphasize the inevitability of change wherever possible in the curriculum. The study of science, for instance, is a study of change. The use of business machines is an illustration of change. Electronics and data processing are examples of change. Using these opportunities and others, teachers should wherever possible create an understanding of the process of change and the implications that change holds for the future lives of students. Continued learning throughout life must be understood as the way of life.

Advisory Committees

The knowledge of the business and industrial community should be utilized by educators planning and operating occupational programs. The value of these groups is well established. Advisory committees should obviously include representation from both management and labor. Most schools maintain a permanent over-all committee but use special and temporary committees with

specific competencies when planning a new course or considering a particular problem.

Department of Employment Security

Close relationship with the Department of Employment Security is not only required by the Vocational Education Act of 1963 but represents a substantial resource for educators. Officials of the department are cooperative in supplying current data on the labor force and on employment needs. Information is available on both local and state-wide levels.

Respectability of Occupational Education

Professor Ralph C. Wenrich of the University of Michigan stated the case well in a speech to a work conference of curriculum workers in secondary education, July 15, 1964, Teachers College, Columbia University.

> "We must be unequivocally committed to the idea that education of employment-bound youth is as important as the education of college-bound youth.------Once having made the commitment we must demonstrate our intent by giving at least as much moral and financial support to programs for employment-bound youth as we have given to programs for college-bound youth. It has been clearly demonstrated that vocational --programs--can acquire the same prestige as the more academic varieties of education if they are adequately supported and properly operated."

High schools found their inception as college preparatory institutions. Today 60 per cent of their students do not go to college. The residual notion that occupational education is second-class education is dangerous as well as erroneous. It affects the election of occupational programs by students who clearly should be enrolled in them. Teachers, administrators, and guidance

counselors play important roles in developing the prestige of occupational education.

IV. VOCATIONAL TECHNICAL EDUCATION IN POST-SECONDARY INSTITUTIONS IN RHODE ISLAND

The report of the consultants, A Proposed Long-Range Plan for Occupational and Vocational-Technical Education in Rhode Island, pages 27-31, and Section II of this report emphasize the need for strong post-secondary programs to prepare for the rapidly developing category of occupations that require more than a high school education but less than a baccalaureate degree. Many of these occupations are related to engineering and science and are, therefor, technical in nature. Career opportunities might be termed "sub-professional." Workers are frequently called "technicians." The need for the sub-professionals is growing more rapidly than the need for the professionals themselves. The United States Department of Labor has pointed out that between 1963 and 1964 there was a 60 per cent increase in job openings for scientists, a 40 per cent increase for engineers, but a 300 per cent increase for technical workers who support the scientists and engineers. Other occupations related to business and commerce are in the same category. They require deeper insights and more highly developed and specialized skills than are usually provided by a high school education.

Typical job designations which give a clue to the occupational level with which the post-secondary program should be concerned are:

Analyst	Laboratory Aide	Registered Nurse
Draftsman	Office Manager	Research Assistant
Executive Secretary	Programmer	Technician

Workers in these categories usually operate under the direction of a professional but must exercise a considerable degree of judgment on their own. They clearly need a body of knowledge and theory drawn from the disciplines of science and the arts from which they can make practical applications. This body of knowledge and theory need not be so extensive as that required by the professional, but it contrasts with the practical and more rudimentary knowledge required of the skilled worker to make application of his skills in practical job situations.

Programs preparing for careers such as those listed usually require two years of education beyond the high school level; some require less than two years of preparation.

Recommended Programs

To prepare youth and adults for the types of career opportunities just described and to serve the economic needs of the state, it is recommended that the following programs in post-secondary vocational-technical education be offered in Rhode Island. These programs are in conformity with the occupational needs of the state and with trends in other states. It will be noted that each program is aimed at a group or cluster of technical or highly skilled ocupations which have a body of common content.

Programs Related to Engineering and Science

Chemical Technology with application to development, production, sale, and utilization of chemical and related products and equipment. Preparation for such position as:

Chemical Laboratory Technician
Chemical Research Assistant
Chemical Control Technician
Chemical Analyst
Salesman for Chemical Equipment

(Consideration should be given to the chemistry of plastics and synthetic fibers.)

Civil Engineering and Construction Technology with options toward building construction and highway construction. Preparation for such positions as:

Engineering Draftsman
Surveyor
Specifications Writer
Estimator
Construction Inspector
Construction Superintendent

Mechanical Technology related to the work of mechanical engineers in the design, development, production, and maintenance of machines and machine tools. Preparation for such positions as:

Production Supervisor
Time and Motion Analyst
Assistant Plant Engineer
Foreman
Machine Designer
Air Conditioning and Refrigeration Technician

Electrical-Electronic Technology with content related to the production, use, and distribution of electric power; also with the design, production and servicing of electronic devices used in manufacturing and communications. Preparation for such positions as:

Electrical Engineering Assistant
Electronic Technician
Research Assistant
Sales Engineer

Instrumentation Technology related to development, production, use, and sale of automatic controls and precision measuring devices in manufacturing plants. Preparation for such positions as:

Quality Control Technician
Production Estimator
Supervisor of Instrument Makers
Salesman for Instrumentation Equipment

Drafting Technology related to building and civil construction and to mechanical, electric and electronic engineering. Preparation for such positions as:

Electrical Draftsman
Architectural Draftsman
Mechanical Draftsman
Structural Draftsman

Data Processing Technology related to the development, installation, operation, and servicing of the rapidly expanding field of data-processing. Preparation for such positions as:

Systems Analyst
Programmer
Computer Operator
Installation Technician

Programs related to Business and Commerce

Business Administration With an option toward the accounting or management aspects of business. Preparation for such positions as:

Accountant
Cost Accountant
Office Manager

Marketing Management with reference to responsible and efficient wholesale and retail merchandising. Preparation for such positions as:

Junior Executive
Store Manager
Merchandiser
Purchasing Agent

Hotel and Resort Management with emphasis on the business and managerial aspects and with relationship to the developing recreational facilities in Rhode Island. Preparation for such positions as:

Owner of Motels and Hotels
Manager of Motels and Hotels
Manager of other Recreational Facilities

Horticulture and Landscaping Technology concerned with the rapidly expanding occupational opportunities dealing with the beautification of public facilities and homes as opposed to the declining employment in agricultural production of foods. Preparation for such occupations as:

Greenhouse Operator
Nurseryman
Landscape Draftsman
Tree Surgeon

Secretarial Science with content related to highly developed secretarial skills, basics of office management and, if in demand, training for specialized secretarial skills. Preparation for such positions as:

Executive Secretary
Secretarial Supervisor
Medical Secretary
Legal Secretary

Programs Related to Health Service

Medical and Health Sciences to include preparation for such positions as:

Professional Nurse
Practical Nurse
Medical Assistant
Laboratory Technician
Dental Hygienist

Other technologies that warrant evaluation are in the areas of (a) Graphic Arts and Advertising, (b) Food Technology , and (c) Communication related to skilled writing and reporting in specialized fields. Detailed curricula for a number of the programs that have been suggested are available from the United States Office of Education: others are in preparation.

The programs just enumerated would for the most part require the equivalent of two years of full-time study beyond the high school level. Some, such as Practical Nursing, would require only one year. The following are important considerations:

Programs should be offered during the day sessions to full-time students.

The same programs should be offered in evening sessions over a longer period of time to serve the interests of employed workers who wish to advance their competency and status.

Enrollment in individual courses should be permitted especially in the evening sessions to allow workers to upgrade specific knowledges or skills.

Junior College - Vocational Technical Centers

In the report, A Proposed Long-Range Plan for Occupational and Vocational-Technical Education in Rhode Island, pages 29-31, it was strongly recommended that these post-secondary programs for highly skilled and technical occupations be offered in unified Junior College - Vocational Technical Centers

as a joint responsibility of the Board of Trustees for State Colleges and the State Board of Education.

At the time of this writing implementation of the recommendation just quoted is being explored by the Board of Trustees for State Colleges and the State Board of Education. This report makes the assumption that the facilities now being planned for the Knight Campus in Warwick and those proposed for later dates in the Blackstone Valley and in the Mount Hope area will be unified and comprehensive Junior College - Vocational Technical Centers.

Placement of Programs in Junior College - Vocational Technical Centers

Warwick Center

The following vocational technical programs of terminal nature are proposed for the Knight Campus in Warwick:*

Chemical Technology	Hotel and Resort Management
Mechanical Technology	Horticulture and Landscaping Technology
Electric-Electronic Technology	Secretarial Science
Drafting Technology	Professional Nursing
Data Processing Technology	Practical Nursing Training (1 year)
Business Administration	Medical Technician Training

These programs should be offered during day sessions, usually as two-year sequences. However, they should also be offered in night sessions over a longer period of time if the Center is to fulfill its obligation to employed workers.

---

*The Rhode Island Junior College included in its offering for the 1965-66 academic year the following technical programs on a two-year terminal basis: Chemical Technology, Electronic Technology, Mechanical Technology and Business Administration. A program for Registered Nurses was announced to start in the fall of 1966.

It is not expected that all programs will emerge full-blown with the opening of the doors on the Knight Campus. It is, however, believed that the programs enumerated should be given priority consideration and that they should develop as the vocational-technical aspect of the Center grows in acceptance. Experience, experimentation, and further study will be required.

Proposed Blackstone Valley Center

Since the Blackstone Valley Junior College - Vocational Technical Center will probably open at a later date than the Warwick Center, it will be possible in planning new programs to take advantage of experience gained over the next few years. It is logical, however, to plan for inclusion in the Blackstone Valley institution certain programs related to the industry of the Valley. It also seems certain that the demand for other programs will warrant inclusion at both Warwick and the Blackstone Valley Centers. A tentative list of programs for Blackstone Valley follows:

Mechanical Technology
Electric-Electronic Technology
Civil Engineering and Construction Technology
Drafting Technology
Data Processing Technology
Business Administration
Marketing Management
Secretarial Science
Dental Technician Training

Proposed Mount Hope Center

In the opinion of the consultants program decisions for the Center planned in the Mount Hope area should be deferred until plans for that facility reach further maturity. Program considerations will be influenced by the background experience which will have been gained at the Warwick and Blackstone

Valley Centers, by movements in industry and population, and by changing technology.

Short-Term Programs

In addition to the formally structured programs thus far discussed, the Junior College - Vocational Technical Centers should plan, especially in evening sessions, to offer single courses or short-term programs required by individuals for up-grading or retraining purposes. Such individuals will have specific and comparatively limited needs. They will not be candidates for an associate degree. Service to them is a very important function of the Centers. A few illustrations of the types of needs that may be anticipated are as follows:

> A worker may need a basic knowledge of chemistry for employment in the manufacture of plastics.
>
> A bookkeeper may be called upon to gain familiarity with newly developed business machines and skills necessary to their operation.
>
> A salesman may need two or three courses in mechanical technology to sell industrial equipment.
>
> A secretary may require courses in medical terminology and office practice to qualify as a medical secretary.
>
> An employee may need some knowledge of instrumentation to be considered for foreman.
>
> A foreman may be called upon for a greater knowledge of mathematics to understand a new technical process which he will supervise.
>
> An industry planning to locate in Rhode Island may demand employees with a basic knowledge of electronic circuitry. Training of applicants may be necessary.

In many instances, such needs might be met by permitting the individual to enroll in existing courses. However, the Centers must be alert to substantial new needs which emerge and, if feasible, should develop programs to satisfy them.

It may be safely predicted that demands upon the Centers for short-term programs will increase steadily. Enrollment in evening sessions will almost certainly come to exceed enrollment in day sessions. By responding fully to the needs for short-term programs the Centers will not only best serve Rhode Island, but they will also make fullest use of their staff and facilities.

Recommendations Related to Program

Admissions Requirements

Broadly stated, admission to programs that prepare for highly skilled and technical occupations in the Junior College - Vocational Technical Centers should be open to high school graduates and to out-of-school youth and adults over eighteen years of age who are able to benefit from the instruction.

High school graduates applying for some of the technically oriented programs may be required to have reasonable background in the sciences and mathematics. If they are lacking in this respect, they should be afforded the opportunity to make-up their deficiencies. They should not, however, be held to the level of academic competency required of students applying to transfer programs. This implies, of course, that the content and academic expectancy of the terminal programs in technical fields will not be synonomous with transfer programs leading toward a baccalaureate degree.

In the case of out-of-school youth and adults, high school graduation and academic record should not be the sole criteria of acceptance. Maturities and motivations change with intervening experiences. Courses taken in the armed services and under other auspices make a difference. Intelligence and equivalency tests together with the judgment of a qualified committee on admissions should determine whether an applicant can carry a given program and profit from it.

Admission to single courses or short-term programs should be based upon the single criterion of whether the applicant can benefit from the instruction.

Flexibility of Program

One of the great values of combining transfer education with terminal education in comprehensive Junior College - Vocational Technical Centers is the flexibility of program which is attainable. Within the limitations of good educational and administrative procedures, programs should be tailored to meet individual needs. In terminal programs, the Centers will not be straight-jacketed by rigid college requirements. It should be possible for terminal students to take certain courses at college level if they are capable of doing so. Conversely, it should be possible for college-bound students to benefit from practical applications of theory made available by equipment and laboratories designed primarily for terminal students. Very important, some students who enroll in terminal vocational-technical programs may develop sufficient academic interest and ability to be shifted to programs leading to a baccalaureate degree; and vice versa, some who find difficulty with transfer programs may be encouraged to

shift to vocational-technical programs.

This philosophy of maximum flexibility to best serve individual needs obviously implies a well manned and effective guidance program.

Technical Education for Women

All national figures show that increasing numbers of women are entering the labor market. Their competency in high level occupations is recognized in the health and secretarial fields. However, there is growing evidence of their ability to compete successfully with men in other technologies. Data processing, chemical technology, and electronic technology give evidence of employing more women. Guidance counselors at both the secondary and post-secondary levels should recognize these possibilities and encourage women to enroll in appropriate programs.

Placement Service

Alert and aggressive placement offices should be included in the student personnel services of the Centers. The reputation of the vocational-technical programs will be greatly influenced by the effectiveness of placement service. However, the function of the offices should be expanded beyond the sole responsibility of placing students. Because placement officials maintain a close contact with employers and have a firsthand knowledge of employment trends, they should play an important role in program planning.

Advisory Council and Committees

A permanently structured Advisory Council should be maintained to

assist in developing the overall program for post-secondary vocational-technical education. This Council should include representatives from business, industry and labor as well as educators representing the Board of Trustees for State Colleges and the State Board of Education.

In addition to the Advisory Council, "ad hoc" committees should be appointed as the need arises to assist in the development of specific courses or programs. Obviously, committee members representing labor, business and industry should be chosen because of their specialized knowledge of the area which the offering is designed to serve.

Respectability of Vocational-Technical Programs

The academic areas in American education have traditionally enjoyed greater status than vocational-technical areas. As has been already pointed out, this attitude begins in the high schools; it carries over into the junior colleges. It affects the status of both faculty and students and has a significant effect upon enrollment in vocational-technical programs.

About eighty per cent of the junior college offerings in the nation are directed toward transfer to four-year institutions. This is a curious emphasis when it is realized that only twenty per cent of our youth are graduated from four-year colleges.

Special efforts should be made at the outset to enhance the prestige of the terminal vocational-technical programs including those offered at night and those of short-term duration. Much will be achieved by the very unification of the Centers themselves and by the mingling of students enrolled in the

terminal and specialized occupational programs with those representing the transfer and academic programs. However, other factors will be important including the emphasis placed upon the vocational-technical aspects of the program by the administrators of the Centers; by skilled guidance performance at both the high school and junior college level,which will dispel the notion that enrollment in a transfer program is necessarily the "thing to do";and by the degree of public acceptance of education for direct employment that is engendered by school authorities and by the industrial community.

The climate of the Centers must not relegate students in the vocational-technical programs to second-class citizenship. Occupational education must be equal in importance to academic education.

Robert L. McKee* reports that nationwide enrollment in post-secondary vocational-technical programs has not increased at the same pace as enrollment in transfer programs. Between 1958 and 1963 the number of students enrolled in occupational programs in two-year colleges increased 40 percent, from 100,000 to 140,000. During the same period enrollment in academic transfer programs increased from 380,000 to 628,000, or 65 per cent. McKee deplores the slower growth in vocational-technical programs as contrary to the needs of youth. In ascribing reasons he gives prominent mention to the factors upon which comment has just been made. To illustrate, he points out that students who have difficulty

---

*Paper by Robert L.McKee, Program Specialist, Division of Vocational and Technical Education. United States Office of Education. Sources: United States Office of Education Opening Fall Enrollments Survey and Organized Occupational Curriculums Survey.

with the academic program prefer to drop out rather than sacrifice "status" by transferring to a terminal program. Such a situation reflects upon both the guidance function and the climate of respectability that has been developed by junior colleges for vocational-technical programs.

If programs at the proposed Junior College - Vocational-Technical Centers leading directly to employment can attain a status image and if they can be creative in design, flexible in operation, and dedicated to service, the consultants foresee a reversal of the national experience in Rhode Island. The student enrollment in vocational-technical programs should grow to equal or perhaps exceed the enrollment in transfer and liberal arts programs.

V. VOCATIONAL EDUCATION FOR OUT-OF-SCHOOL YOUTH AND ADULTS IN RHODE ISLAND

The consultants in their reports have emphasized the need for a wide range of vocational education available to out-of-school youth and adults. (See A Proposed Long-Range Plan for Occupational and Vocational-Technical Education in Rhode Island, pages 32,33.) The impact of expanding technology and automation on the lives of people is just being realized and is not generally appreciated. Machines, processes, and whole industries can become obsolete within a few years. At best, workers at all levels will need upgrading to keep abreast of their fields; at worst, they will require retraining. It may be necessary to re-educate a single individual four or five times during the course of his working career. Present efforts are insufficient to meet the demands that may be anticipated in the next decades Rhode Island, in the interests of its economy and its human resources, will be wise to plan for these developments.

The scope of the occupational education which will be required by out-of-school youth and adults is broad. It will range from training courses of a few weeks duration for single manipulative skills to educational programs of one, two, or three years in complex technologies. It will embrace instruction in elementary reading and arithmetic as well as college science and math; in welding as well as computer operation. It will include both men and women. It will be diversified enough to cover not only the manufacturing field but also business and office occupations, health services, and horticulture. Programs will operate during the day for unemployed workers and during the late

afternoon and evening for employed workers

Any given program of instruction should be placed in an institution which can provide adequate facilities and equipment, which is appropriate to the age and status of those who require the instruction, and which, insofar as possible, is in geographic proximity to the demand. The Junior College - Vocational Technical Centers and the high schools will both play important roles. In addition, there will be a need for a centrally located occupational training center for adults.

The very important function of the Junior College - Vocational Technical Centers in providing short and long-term instruction at appropriate level for out-of-school youth and adults has received comment in the preceding section of this report.

Occupational Education in the High Schools for Out-of-School Youth and Adults

The function of the high schools in upgrading out-of-school youth and adults is no less important than that of the Junior College - Vocational Technical Centers Expanded evening programs of occupational education in Rhode Island high schools are called for. High schools should operate principally at a lower instructional level than the Junior College - Vocational Technical Centers. Some programs should be planned to meet the needs of drop-outs who, upon exposure to the world of work, have become cognizant of their deficiencies and wish to remedy them. Other programs should be designed for high school graduates who require further specialized but basic training. In addition, courses should be offered for unskilled or semi-skilled workers whose jobs demand that they acquire greater knowledge or skill. Consequently, programs should be diversified and of both short and long-term duration.

It is apparent that high school educators, in cooperation with the Department of Employment Security, must be alert to the needs of individuals within the communities which they serve. It is also evident that individual courses and programs must be tailored in content and duration to meet these needs. Flexibility is essential. Furthermore, continuous appraisal is necessary to determine what instruction should be offered at a given time.

In view of these facts, it is impossible to outline a fixed set of high school offerings for out-of-school youth and adults. The following examples illustrate only a few of the types of needs that should be considered:

A young service station attendant may require training in automobile mechanics.

A drop-out may need remedial instruction in reading and arithmetic.

A receptionist may find that she is called upon for basic typing skills.

A clerk in an electrical appliance store may need instruction in repairing the appliances.

An industrial worker may need to learn blue-print reading.

A girl graduated from a general curriculum may develop an interest in cosmetology and request training to enter the field.

A bank clerk may find that he needs instruction in key-punch operation for data processing.

A recent graduate employed in a marina may require a course in small engine repair to permit him to service outboard motors.

It will be noted from the illustrations given that the principal (though not exclusive) responsibility of the high schools will lie in the area of upgrading rather than retraining. Upgrading implies the acquisition of new knowledge and

skills that will keep a worker abreast of new developments or improve his occupational status. Retraining, on the other hand, usually suggests that a worker master a new manipulative skill in substitution for one that is no longer saleable. In most instances retraining will be better accomplished in an adult occupational training center, while upgrading fits naturally into the function of the Junior College - Vocational Technical Centers and the high schools.

A district high school should offer programs for which it is equipped and for which there is sufficient need within the community. In many instances district high schools have good facilities for office occupations, very adequate science laboratories, and some shops. An area comprehensive high school should be better equipped for a broad range of instruction. It should not only meet the needs of its own community, but it should also offer justifiable programs which are not available at the district high schools in its designated area. Cooperative planning within areas will be required to avoid unnecessary duplication of programs.

The importance of adequate guidance to young people has previously been emphasized in this report. It is urgently suggested that as high school guidance programs are expanded, they be extended to include service to drop-outs and young graduates.

Occupational Education in a Proposed Occupational Training Center for Adults

Certain types of occupational training programs for mature adults do not fit easily into either the high schools or the Junior College-Vocational Technical Centers. These programs may ordinarily be characterized as retraining activities.

In general they are involved with manipulative skills. In some instances the high schools do not possess the equipment necessary to offer the instruction. In other cases the best worker response is obtained by placing the programs in a central industrial-type facility devoted to intensive, practical, and short-term courses. Such a facility should also accommodate apprentice training.

Based upon known and anticipated labor market needs, Section II of this report recommends that instruction in the following occupations be offered in an occupational training center for adults:

Foods Trades Occupations

Baker
Cook
Meat Cutter
Waiter, Waitress

Manufacturing Occupations

Machine Tool Operator
Maintenance Mechanic
Welder
Assembler

Needle Trades Occupations

Power Sewing Machine Operator

Service Occupations

Automobile Body Repairman
Electrical Appliance Repairman

Other programs will be required and certainly this list will respond to changing needs.

An adult occupational training center should meet certain physical criteria.

1. It should be located in a center of population.

2. It should possess good equipment including facilities that permit it to offer instruction not available in the high schools and the Junior College - Vocational Technical Centers.

3. It should convey an industrial rather than an academic atmosphere.

In the opinion of the consultants, the Rhode Island Vocational and Technical School at Corliss Park provides an excellent facility for an occupational training center for adults. Its location is ideal. It is well equipped and would require only the addition of a foods center, an automobile repair shop, and possibly an installation of power sewing machines. It is therefore recommended that after a period of transition to permit the development of the area comprehensive high schools, an occupational training center for apprentices and adults be established in the Corliss Park facility. (Other recommendations pertaining to the use of the building are made in the next section of this report: Future use of the Rhode Island Vocational and Technical School at Corliss Park.)

The administrator of the proposed adult occupational training center should operate a flexible and service-oriented program. He should operate in close relationship to the Department of Employment Security.

Implementation of Vocational Education for Out-of School Youth and Adults

The dimensions of the overall program which will be required to upgrade and retrain out-of -school youth and adults in Rhode Island may make implementation appear difficult and expensive. Actually, segments of the suggested plan will fall into place with the expansion of occupational and vocational-technical programs in the high schools and in the

Junior College - Vocational Technical Centers. Federally subsidized facilities and equipment procured for day programs will be available for evening sessions. Also staff recruited for day sessions can be drawn upon for evening programs. Furthermore it will be noted that most of the programs suggested for the occupational center for adults are of the type eligible for federal subsidy under the Manpower Development and Training Act. This act has provided 100 per cent reimbursement for programs operated for unemployed workers and 50 per cent of the cost of upgrading programs for under-employed workers. It is significant that in 1965 the provisions of the act were altered to pay 100 per cent of the costs of programs for both unemployed and under-employed workers. The consultants therefore believe that the broad plan herein proposed can be achieved without undue burden or expense.

VI. FUTURE USE OF THE RHODE ISLAND VOCATIONAL AND TECHNICAL SCHOOL AT CORLISS PARK

If occupational education at the secondary level is provided in comprehensive high schools, as recommended, the Corliss Park facility will become available for other purposes. The consultants view this as a fortuitous circumstance because they foresee a need for a central facility of this type. The recommendation has already been made in the preceding section of this report that an adult occupational center, to include apprentice and MDTA programs, be housed in the building. In the report A Proposed Long-Range Plan for Occupational and Vocational-Technical Education for Rhode Island it was also recommended that centers for instructional materials and for research be established here. It is now furthermore proposed that consideration be given to moving the offices of the Vocational Division of the State Department of Education to this location, thus creating a kind of Vocational-Technical Education Center. Alteration of the gymnasium to a two-story structure might add sufficient facilities to accommodate the several purposes mentioned.

Under the impetus of the Vocational Education Act of 1963, occupational education has become one of the most rapidly developing fields in American education. There is urgent need for new programs and courses, for expanded services, and for improved teaching methods and materials. The Act itself underscores the problem by reserving 10 per cent of the annual national appropriation for research. With this incentive other states are setting up instructional materials centers and developing proposals for experimentation.

The consultants believe that Rhode Island should move in this direction. A few suggestions for important research and experimentation follow:

Further study of subject matter that can provide common basic background for families or "clusters" of occupations.

Development of courses in occupational education for girls that should be offered within the home economics program.

Experimentation with new cooperative (work-study) programs in several different occupational fields.

Study of a selected sample of drop-outs to determine, (1) why they left school, (2) what types of occupational programs they need, and (3) what approaches will motivate them to further schooling.

Pilot studies in expanded vocational guidance including school sponsorship of work experience in the afternoons and during summer vacations.

Placing the central staff in proximity to facilities and resources necessary to research and experimentation has real advantages. The arrangement is also ideal for conducting in-service training programs for teachers. The proposed Vocational-Technical Education Center, then, would not only provide needed facilities for adult occupational training, for research activities, and for enlarged office space to accommodate an expanded division of vocational education, but it would also effect a happy marriage of coordinate activities. The consultants believe that the proposal has merit.

VII. SUMMARY OF CONCLUSIONS

This report is an effort to suggest programs in occupational and vocational education which are related to the needs of Rhode Island. This summary makes no attempt to enumerate the many specific offerings that have been proposed for post-secondary students, for high school pupils, and for out-of-school youth and adults. However, a purpose may be served by reviewing the important concepts which are basic to successful programs.

1. Programs must be planned to meet current and anticipated needs. In order to avoid lag in a fast-moving technological economy, educators must be sensitive enough to recognize change and astute enough to foresee the implications of the present for the future.

2. Occupational and vocational-technical education can assume no fixed pattern. It must maintain sufficient flexibility in both overall design and specific content to meet changing needs.

3. In an era when learning has become a life long necessity, instruction for out-of-school youth and adults is assuming major importance in the lives of people and in the development of the economy.

4. The public image of occupational education must be improved. Leadership of the educational and business enterprises must join forces to make education for employment equal in respectability to preparation for college. Unrealistic notions of the distinction between general education and preparation for employment must be broken down.

5. Occupational and vocational-technical education should be designed to provide as broad a base as possible, and specialization should be deferred as long as possible.

6. The insights of qualified industrial and business leaders should be sought in planning programs of occupational and vocational-technical education.

7. Intelligent guidance including placement service should support occupational and vocational programs.

8. The occupational education of females should receive increased attention.

9. Actual work experience provides holding power and creates valuable attitudes. Cooperative (work-study) programs should be much more fully developed than they are at present.

10. Experimentation and research are required to improve programs and teaching in occupational and vocational-technical education.

It is not anticipated that all the recommendations made in this report can be implemented immediately. Some time will be required to effect a sound and orderly growth. In the light of developing circumstances certain recommendations may need modification. However, it is believed that the proposals made and the principles upon which they are based are sound. It is hoped that they will be helpful in developing an outstanding program of occupational vocational-technical education for the benefit of the people and the economy of Rhode Island in the years to come.

Trade Preparatory Training Planning Guide: Auto Mechanics.

North Carolina State Dept. of Public Instruction, Raleigh. Trade and Industrial Education
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Jul64 16p.

PROGRAM GUIDES; *ADMINISTRATOR GUIDES; *AUTO MECHANICS; *TRADE AND INDUSTRIAL EDUCATION

This program guide is to aid school administrators in planning facilities for conducting trade preparatory classes in auto mechanics. It was developed by the State Staff for Trade and Industrial Education from the recommendations and suggestions of trade preparatory teachers in the secondary schools. The purpose of the auto mechanics course is to develop skills and understanding needed in making inspections and tests to determine the causes of faulty operation of vehicles and in making repairs or replacing defective parts to restore vehicles to proper operating condition. The suggested course of study requires 3 hours per day, 5 days per week for a 2-year period and covers 18 units such as engine units, the clutch, the transmission, wheel alignment and balance, and brakes. The students should have achieved a level of maturity expected of any beginning worker, have satisfactorily completed eight high school units, have average intelligence or above, and score satisfactorily on a standardized intelligence quotient test or The General Aptitude Test Battery. Upon completion of this 2-year course, the students should be employable as apprentice mechanics. The shop facility should be a self-sustaining unit with a recommended area of 6,160 square feet. An extensive equipment list to serve as a guide to proper equipment selection is provided. (HC)

TRADE AND INDUSTRIAL EDUCATION
RALEIGH, NORTH CAROLINA

PREFACE

This planning guide has been developed to aid school administrators in planning facilities for conducting Trade Preparatory classes.

The recommendations and suggestions contained in this guide are a composite of the thinking and practices of the Trade Preparatory instructors who are now teaching in the secondary schools of North Carolina. The State Staff for Trade and Industrial Education has compiled this information and put it in its final form.

It is hoped that through its use adequate facilities will be provided wherein effective programs of Trade Preparatory Training can be conducted.

AUTO MECHANICS

(D.O.T. 5-81.000 through 999, 7-99.060,
7-81.000 through 999)

Introduction

Motor vehicles are kept in good running order by automobile mechanics. These skilled workers maintain and repair mechanical, electrical, and body parts of truck and buses as well as passenger cars.

While many automobile mechanics are classed as "all-round mechanics", many of them are specialists who deal only with problems in a special category such as, automatic transmissions or tune-up.

The skilled mechanic must know how to use many different kinds of tools and equipment. These may range from simple hand tools such as screw drivers, wrenches, and pliers to complicated and expensive machines and equipment.

Upon completion of this two-year course, the students should be employable as apprentice mechanics. Following completion of his apprenticeship program, the trainee would retain his present employment as an all-round mechanic or in his speciality field.

AUTO MECHANICS

Objectives

1. To develop the necessary skills, technical information, and job judgment required for employment as an advanced learner in the automotive trades.

2. To provide basic experience in such manner that its use may be applied to other closely allied mechanical pursuits.

3. To develop safe, orderly and reliable work habits.

4. To develop occupational competence and high standards of workmanship.

5. To develop an appreciation and understanding of the work done by other crafts and how this work fits into the automotive trades.

As new methods, materials, tools and labor saving devices are gradually being introduced into the automotive industry, it becomes increasingly important that yearly evaluations be made of the course content of our training programs in order that the type of craftsmen that can meet the demands of our society might be developed.

AUTO MECHANICS

Admission Requirements

The applicant requesting admission to this course should have achieved a level of maturity expected of any beginning worker. He should show evidence of having satisfactorily completed eight high school units. It is desirable that at least two of the eight units be in mathematics; two shall be in English and one shall be in science.

The applicant shall be of average intelligence or above, and should show evidence that he has scored satisfactorily on a standardized intelligence quotient test or make a qualifying score on the General Aptitude Test Battery. For this field of work, he should be mentally alert, physically fit and possess the interest and ability to profit by the experience he will receive. These factors will be determined by tests and interviews administered by the guidance center and/or administration.

The teacher in charge of the course shall conduct the final interview and upon the basis of this interview and the student's test profile, he shall make whatever recommendations are necessary. If all of the above mentioned information leaves any doubt in the teacher's mind about the applicant's ability and intention, he may recommend that the applicant be admitted for a probationary period. This period is to be terminated at the teacher's request.

AUTO MECHANICS

Housing and Physical Facilities

Adequate space is a prime requisite in establishing a vocational training program. Inadequate space creates safety hazards and impairs instructional efficiency. The shop should be a self-sustaining unit, free of inside obstruction. Maximum flexibility can be achieved with the use of non-load-bearing walls. Recommended sizes of the areas required are listed below:

1.	Work area	4,000 sq. ft.
2.	Tool room	300
3.	Storage	600
4.	Office	100
	*Subtotal	5,000 sq. ft.
5.	Related classroom	750
6.	Restroom	150
7.	Shower +	110
8.	Locker room	150
	Total	6,160 sq. ft.

*Subtotal - This will meet space requirements if provision is made elsewhere for items # 5, 6, 7, and 8.

+ - Highly desirable - not absolutely required.

If it is quite obvious that spaces nearly equal to those listed above cannot be provided, it is recommended that a mechanic training program requiring a lesser amount of space be considered. Two such programs and the respective space requirements are:

Internal Combustion Engines - 4,160 sq. ft.

Small Gas Engines - 2,650 sq. ft.

AUTO MECHANICS

Course Description and Outline

This course is designed to develop skills and understandings needed in making inspections and tests to determine the causes of faulty operation of vehicles and in making repairs or replacing defective parts to restore vehicles to proper operating condition.

The course of study for Auto Mechanics requires three hours per day, five days per week for a two-year period in the following units:

- Safety
- Precision instruments and hand tools
- Soldering and welding
- Engine operating principles
- Engine units
- The fuel system and carburetion
- The ignition system and distributor
- The starter motor and controls
- The generator and regulator system
- Troubleshooting
- The clutch
- The transmission
- Universal joints and the propellor shaft
- The differential
- Rear axle, springs and shock absorbers
- Wheel alignment and balance
- Brakes
- Automotive maintenance

AUTO MECHANICS

Tools and Equipment

The equipment listed herein is basic to this area of training. This list is intended for use as a guide to proper equipment selection. The complete and detailed list of equipment should be developed by the local advisory craft committee and instructor with the approval of local administration. All equipment and supplies purchases should conform to the instructional program.

If the list of tools and equipment developed by the advisory craft committee for Auto Mechanics proves to be more than can be provided, at this time, it might be well to consider initiating a course with fewer tools and items of equipment. Two such courses are:

1. Internal Combustion Engines
2. Small Gas Engines.

In addition to the tools and equipment, it will be necessary to have various automotive components such as, engines, transmissions, differentials, etc. Some new car dealers, through factory arrangements, can supply automotive units for study purposes. Used-parts dealers are often happy to contribute used assemblies for use in the local school program.

It is suggested that after the original equipping of the Auto Mechanics shop an annual budget of $500 to $1,000 be established. This will help to keep the shop equipment up-to-date and in good repair. This in turn will strengthen the instructional program.

AUTO MECHANICS

Tool and Equipment List

Quantity	Description
1	Caliper, 6" inside, spring type
1	Caliper, 6" outside, spring type
1 ea.	Carburetor tool kit, complete set of overhaul tools for popular carburetors--Carter, Rochester, Halley, Strombery
6	Chisels, cape 1/4" - 6"
6	Chisels, cold 1/2"-6"
3	Chisels, diamond point 6"
1	Complete set of taps and dies and die stock and T-handle, uss, sae, No 4 screw to 1/2
1	Divider , 6" with replaceable points, spring type
1	Drill stand-fractional 1/16" to 1/2"
1	Flaring tool - 3/16" to 5/8" O.D. tubing size
1	Leaf type feeler gauge, brake drum and shoe
1	Tire gauge, 0-60 lbs. capacity
1	Screw pitch gauge, 60° V type thread, 22 pitches, 32 to 74
1	Thickness gauge , 6" blade, 8 tapered leaves, .002, .003, .004, .006, .008, .010, .012, and .015 leaves
1	Thickness gauge, 2 5/16" length blade, 22 blades, .004" to .025" cased
5	Machinist hammers, 12 oz. ball peen, forged steel
5	Machinist hammers, 24 oz. ball peen, forged steel
1	Sledge hammer, 7 lb. bell face, forged hardened
6	Soft face hammers, all hammers with wooden handles
6	Putty knives, 1 1/4" wide, 3 1/2" long tempered steel
1	Micrometer, inside diameter - calibrated to .001", range 2"-9 1/2", calibrated thimble with ground steel extension rods. Angular grooved extensions.
1 ea.	Micrometer, outside diameter - drop forged 1" section frame. Anvil, spindle and barrel high quality ground steel. Standard calibrations sizes 0-1", 1-2", 2-3", 3-4"
4	Oilers, 5 oz. 3" spout, steel can
2	Oilers, 1 pt. capacity 9" spout, hydraulic pump oiler
1	Oil stone, 4" x 1 3/4" x 1/2" medium
1	Oil measure, 2 qt. galvanized
2	Piston ring inserters
1	Pliers, 5" flat nose, cross-checked, forged tool steel
1	Pliers, 7" flat nose, long tapered forged steel
6	Pliers, 8" combination slip joint forged tool steel
6	Pliers, 7" diagonal
2 sets	Punches, drive pin 8" knurled steel, set of 8 1/16" dia. to 5/16" dia.
2	Punches, center 1/4 x 4"
4	Rules, 12" x 1" steel, graduated 1/8", 1/16", 1/32", 1/64"
4	Saws, hand hack, 8"-12" adjustable frame, 2 3/4" throat, with pistol grip handle
6	Screw drivers, 3" common
12	Screw drivers, 6" common 5/16" diameter
6	Screw drivers, 9 1/2" common 5/16" diameter
6	Screw drivers, 6" common 3/16" diameter
2 sets	Screw drivers, offset, forged and tempered tool steel set of 6 for 3/16" to 3/4"

Quantity	Description
2 sets	Phillips screw drivers, set of 4 to fit No. 1, 2, 3 & 4
2 sets	Clutch head screw drivers, set of 4. No. 1,2,3 and 4
2 sets	Screw extractors
2	Scriber - 1/8" dia. 10" double point
2	Snips, tin, straight 3" drop forged hardened tool steel
1	Snips, tin, curved 3" drop forged hardened tool steel
1	Soldering iron electric, 5/8" electric soldering copper, 200 watt complete with cord and stand
1	Square, steel, tempered 12" blade with forged square, center, protractor heads
1 set	Stamps, steel, 3/16" hand cut figures 1 to 0
1 set	Stamps, steel, 3/16" hand cut letters A to Z
3	Wrenches, 8" single and adjustable jaw, forged steel
3	Wrenches, 12" single and adjustable jaw, forged steel
2	Wrenches, pipe - 10" length, 2" capacity, forged jaws
1 set	Wrench, Spanner-adjustable hook, drop forged, set of 3, 3/4" to 4 3/4" diameter
1	Wrench, spanner-adjustable face spanner, drop forged
1	Wrench, Allen, one set of 11
5	Wrenches, double broached hex, double offset drop, forged chrome alloy steel, guaranteed (short length) 4 1/2" to 6" size from 3/16" to 11/16"
2	(long length) 8" to 19" size from 5/16" to 1"
2 sets	Wrenches, ignition and electrical open end, double end, set of 9; 13/64" to 5/16"
5 sets	Square drive socket wrench set, 1/2" including sockets, U joint. Extension, 3 lengths and 4 drive handles.
2 sets	Square drive deep socket wrenches 1/2"
5 sets	Wrenches, 3/8" square drive socket wrench set including sockets, U joint, 3 extensions and 4 drive handles, speed, henged offset, ratchet, sliding offset
1 set	Wrenches, set of 3/8" drive deepsockets, open end
5 sets	Wrenches, set of open ends, 1/4" to 1" openings
2 sets	Wrenches, tappet
1	Equipment and testing devices, Air compressor As needed - Airlines and chucks
1	Aligning jig - for connecting rods
1	Arbor press - 25 ton hydraulic
3	Carriers (battery equipment)
1	Slow charger - 6 and 12 volt (battery equipment)
1	Fast charger - 6 and 12 volt (battery equipment)
2	Hydrometers (battery equipment)
1	Syringe and container (battery equipment)
1	Voltmeter, prong type (battery equipment)
8	Benches, work with vices (4" vice)
1	Bench, work portable with vice
1	Reliner - combination riveter and grinder (brake equipment)
2	Braker bleeder (brake equipment)
1	Lining bonder and remover (brake equipment)
1	Drum lathe with necessary attachments, drum micrometer, Cylinder hone, lining clamps (brake equipment)
1	Lining grinder with necessary adapters to grind and centralize brake shoes
4	Containers - pans, galvanized radiator drain with pour spout

Tools and Equipment (Cont'd)

Quantity	Description
6	Containers - can, waste, galvanized
1	Chain hoist - with overhead trolley and monorail, 3 ton capacity
1	Steam or solvent type (cleaner parts)
1	Ring groove cleaner
8	Cord - extension light, complete with rubber handle and socket, outlet on handle, 25' length
8	Creepers - 4 universal casters
1	Drill, electric portable 1/4"
1	Drill, electric portable 1/2"
1	Drill, press 21" with motor and chuck
8	Pairs of fender covers
1	Cylinder gauge, dial indicator, universal type attachments complete in case
1	Compression gauge, dial face
1	Grease dispenser - chassis pressure type
1	Grease dispenser - transmission lube dispenser
2	Grinders - electric bench grinder, 2 six-inch dia. wheels with motor, switch, gards, and tool rests
1	Grinder - cylinder, with motor and hone, use with drill
1	Growler, 110 V-60 Cycle, for testing generator and starter armatures
1	Honing machine - electric motor driven, for piston pins, king pins, etc. with mandrels 1/8" to 2 5/8" inside dia.
4	Jacks - floor roller, hydraulic 2 ton
1	Jack - hand stationary jack, hydraulic type, 1 1/2 ton lifts
1	Lift - automobile, hydraulic, twin post
1	Lift - automatic transmission hydraulic lift
1	Meter - AVR 75 ampere D.C. 6, 12 and 24 volt scales D.C. complete with standard load resistors. Encased in durable portable case with heavy leads and clips attached
1	Meter - ammeter, 30 amp. capacity
1	Meter - voltmeter, 10 volt rating
1	Pullers, 1 complete set for all types of jobs as needed
1	Radiator hydrometer, calibrated for alcohol, glycerine, and ethylene glycol with built-in thermometer
1	Spring tension scale - brush and point, 0-48 oz. with book prong
1	Spring tension scale - steering gear scale, 0-4 lbs.
16	Stands - car stands (horse) 2 ton min. capacity
1	Stands - engine build up stand 360° swing
1	Rear axle overhaul stands
1	Coil tester
1	Condenser tester
1	Distributor tester, tachometer
1	Mutor tester analyzer - M.M.T.
1	Power timing light
1	Sparkplug cleaner and tester
1	Headlight tester
1	Thermometer tester, fahrenheit scale
1	Vacuum and fuel pump tester
1	Bead expander (tire service)
1	Tire changer with bead breaker
1	Tire gauge
1	Tire tester (water tank)

Tools and Equipment (Cont'd)

Quantity	Description
1	Tire repair kit (tubeless)
1	Valve refacer with adjustable base, 110 v. 60 cycle motor-priced with seat grinder
1	Valve seat grinder, complete with stones
1	Valve spring compressor, adjustable for L-Head engines
1	Valve spring compressor, adjustable for overhead valves
1	Test rack with front pit preferred (wheel alignment equipment)
1	Three-way alignment gauge set for camber, caster, and kingpin inclination, including adapter sleeve and clamp to fasten to spindle and turning radius plates
1	Toe-in gauge (wheel alignment equipment)
1	Wheel balancer, static and dynamic
	File Card
	Assorted small tools as needed
	File, assorted as needed
	Cylinder boring bar
	Oxy-acetylene welding unit complete with regulators, tips, hose, and cutting tip

AUTO MECHANICS

Recommended Text and References

It will be necessary for each student to have an Auto Mechanics textbook. In addition, a library should be established and maintained in the related study classroom. The library should include three or four good automotive encyclopedias and a good selection of other automotive reference books.

The State Supervisor of Trade and Industrial Education should be contacted for a list of books that will meet these needs.

PROGRAM GUIDES; *ADMINISTRATOR GUIDES; *TRADE AND INDUSTRIAL EDUCATION; *ELECTRICITY; HIGH SCHOOLS; HAND TOOLS; *ELECTRONICS

This program guide is to aid school administrators in planning facilities for trade preparatory courses in electricity and electronics in secondary schools. It was developed by the State Staff for Trade and Industrial Education from recommendations and suggestions of trade preparatory teachers. The program objective is to develop the necessary skills, technical information, and job judgment required for employment as an advanced learner in an electrical trade. The basic course outline includes (1) Basic Electricity and Electronics, (2) Electric Appliance Repair, (3) Electric Motor Repair, (4) Electrical Installations, and (5) Radio and T.V. Service. The course requires 1,080 hours of instruction which may be presented as either plan I, a 2-year program, or plan II, a 3-year program. The students should have achieved a level of maturity expected of any beginning worker, have completed 8 high school units, preferably two each in mathematics and English and one or more in science, and have scored satisfactorily on a standardized intelligence quotient test or the General Aptitude Test Battery. Upon completion of the training, the students should be employable as apprentices. A suggested tool and equipment list contains the names and prices of necessary breadboard and test equipment, student tool kits, and general tools and equipment for each of the electrical areas. Adequate space is a prime requisite in establishing a vocational training program. The recommended space requirement for 15 to 20 students is 2,250 square feet. (HC)

PREFACE

This planning guide has been developed to aid school administrators in planning facilities for conducting Trade Preparatory classes.

The recommendations and suggestions contained in this guide are a composite of the thinking and practices of the Trade Preparatory instructors who are now teaching in the secondary schools of North Carolina. The State Staff for Trade and Industrial Education has compiled this information and put it in its final form.

It is hoped that through its use adequate facilities will be provided wherein effective programs of Trade Preparatory Training can be conducted.

Charles D. Bates, State Supervisor
Trade and Industrial Education

ELECTRICITY/ELECTRONICS

Introduction

The age of the electron has arrived and is evident throughout our environment. Persons cannot exist today without becoming aware of the marvels of electricity and electronics. The electric alarm that starts our day, the electric range on which we cook, and the relaxation derived from television, show us that the electron dominates our world.

As electronic devices are developed, so must the knowledge of the people who repair these marvels. House wiring is no longer a do-it-yourself job. Trained men must deal with the house or plant load, phasing, and special switching arrangements. The electric range is no longer a dependent appliance. Meals desired at noon or in the evening may be prepared and started in the morning. While the shopping is being done, the range cooks the meal. The appliance repairman can no longer be the handyman on the block, but must be a trained person. Electric motors serve our society in many ways. The air conditioner motor, elevator motor and many others help to make us aware of the fact that a trained person must build, maintain, and repair these motors. The average time spent before the television set is about 20 hours per week, per family. The special circuitry of our television, stereo, and hi-fi systems require a trained person for maintenance and repair.

Persons preparing for an electricity/electronics occupation should have a thorough introduction to electricity. The basics of electricity, whether for motor repair or for T.V. repair, are the same. The type of special work in each area requires specialized study by the student. These specialties may appear as appliance repair, electric motor repair, electrical trades and radio and T.V. repair. In order for a student to be proficient in these

occupations, he must have a desire to use hand tools and equipment, a will to accomplish, and an understanding of mathematics.

Upon completion of high school training in one of these four fields, the students should be employable as apprentices. Following the completion of apprenticeship programs, the trainees would probably retain their present employment in their respective specialty fields.

ELECTRICITY/ELECTRONICS

Objectives

1. To develop the necessary skills, technical information, and job judgment required for employment as an advanced learner in the field of Electricity/Electronics, specifically in one of the four following areas:

   a. Electric Appliance Repair

   b. Electric Motor Repair

   c. Electrical Installations

   d. Radio and T.V. Service

2. To provide basic experience in such manner that its use may be applied to other closely allied electrical or electronics occupations.

3. To develop safe, orderly, and reliable work habits.

4. To develop occupational competence and high standards of workmanship.

5. To develop an appreciation for and understanding of the work done by other crafts and how this work relates to occupations in the field of Electricity/Electronics.

As new methods, materials, tools and labor saving devices are gradually being introduced, it becomes increasingly important that yearly evaluations be made of the course content of our training programs in order that the type of craftsmen that can meet the demands of our society might be developed.

ELECTRICITY/ELECTRONICS

Admission Requirements

The applicant requesting admission to the course should have achieved a level of maturity expected of any beginning worker. He should show evidence of having satisfactorily completed eight high school units. It is desirable that at least two of the eight units be in mathematics, two in English, and one or more in science.

The applicant should be of average intelligence or above, and should show evidence that he has scored satisfactorily on a standardized intelligence quotient test or make a qualifying score on the General Aptitude Test Battery. For this field of work, he should be mentally alert, and possess the interest and ability to profit by the experience he will receive. These factors will be determined by tests and interviews administered by the guidance center and/or administration.

Teachers and guidance counselors should screen the applicants according to aptitude and ability so that students wishing to study advanced options may progress at a rate necessary for those areas. This will maintain a standard throughout classes, allowing the teacher to add special projects or move at a faster or slower rate, according to the ability level in each class.

The teacher in charge of the course shall conduct the final interview, and on the basis of this interview and the student's test profile, he shall make whatever recommendations are necessary. If all of the above mentioned information leaves any doubt in the teacher's mind about the applicant's ability and intention, he may recommend that the applicant be admitted for a probationary period. This period is to be terminated at the teacher's request.

ELECTRICITY/ELECTRONICS

Housing and Physical Facilities

Adequate space is a prime requisite in establishing a vocational training program. Inadequate space creates safety hazards and impairs instructional efficiency. Maximum flexibility can be achieved with the use of non-load-bearing walls.

The related study room should include the following:

1. Adequate chalkboard
2. Projection screen and room darkening facilities
3. Adequate study materials - books, references, charts, etc.
4. Sufficient lighting, heating, and ventilation
5. Standard classroom furniture for approximately 20 students.

Electronic shops should be designed for team study, and it is recommended that stations for two students each be supplied. These benches may have drawers and space underneath for equipment storage, or equipment may be stored in wood or metal storage cabinets along the side of the room. A storage room adjacent to the electronics laboratory should be kept for specialized equipment and needed accessories.

Electrical requirements for each station should include a minimum of four duplex 110 A.C. outlets. It is desirable that each bench be fused separately.

RECOMMENDED SPACE REQUIREMENTS

(15 to 20 students)

Work space	1,400 sq. ft.
Classroom space	400
Tool room	150
Storage	180
Office	120
Total	2,250 sq. ft.

ELECTRICITY/ELECTRONICS

Course Plan

The class time required to complete this course in Electricity/Electronics is 1,080 hours. This may be accomplished through one of the following two plans of course organization:

Plan I

Grade 11 - 3 hours per day for one year	(540 hours)
Grade 12 - 3 hours per day for one year	(540 hours)
	(Total 1,080 hours)

Plan II

Grade 10 - 1 hour per day for one year	(180 hours)
Grade 11 - 2 hours per day for one year	(360 hours)
Grade 12 - 3 hours per day for one year	(540 hours)
	(Total 1,080 hours)

The first 540 hours includes Introduction to Electricity/Electronics (180 hours) and Basic Electricity/Electronics (360 hours) which allows the flexability to establish the course as a two or three-year program.

The last 540 hours includes advanced training in Electricity/Electronics and one of the following options:

1. Electric Appliance Repair (DOT 5-83.043)
2. Electric Motor Repair (DOT 5-83.443)
3. Electrical Installations (DOT 4-97.010)
4. Radio and T.V. Service (DOT 5-83.411)

It is not expected that any but the larger schools will have sufficient enrollment to justify the establishment of facilities for all four options. It is recommended that adequate provision be made for additional terminal options as rapidly as student need and financing will allow. The introductory and basic levels of training should be geared to the final options provided for, in each school.

ELECTRICITY/ELECTRONICS

Course Outline

The course of study for Electricity/Electronics requires 1,080 hours. (This includes Introduction to Electricity/Electronics, Basic Electricity/Electronics, and one option - note course plan.) The study in each of the four final options requires three hours per day, five days per week for the final year in the course (540 hours). The basic outline includes:

Basic Electricity/Electronics

- Introduction
- Materials, tools, and processes
- How electrons flow
- Electrons at work
- Sources of electric energy
- Electrical tests and measurements
- Common electrical equipment
- Communications systems
- Radar and television
- Schematic diagrams
- Soldering techniques
- Direct current
- Ohm's Law
- Kirchhoff's Law
- Measuring devices
- Inductance
- Transformer characteristics
- Capacitors
- Reactance
- Thermistors
- Vacuum tubes
- Amplifiers
- Power supplies
- Audio amplifiers
- Power amplifiers
- Diode detection
- Oscillators
- Hetrodyne detection
- Transistors
- Transistor characteristics
- Transistor circuitry

Electric Appliance Repair Option

- Routine shop work
- Appliance construction and operations
- Live cords, plugs and attachments
- Heating elements and thermostats
- Motor-driven appliances
- Appliance servicing as a business

Course Outline (Cont'd)

Electric Motor Repair Option

- Motor and generator principles
- Introduction to A.C. motors
- Split-phase induction motors
- Capacitor motors
- Repulsion motors
- Shaded pole and universal motors
- Polyphase motors
- D. C. armatures
- Direct current motors
- A. C. and D. C. generators

Electrical Installations Option

- Underwriters and codes
- Types and sizes of wire
- Different wiring methods
- Service entrance and branch circuits
- Planning and installation
- Installation of switches and outlets
- Wiring heavy appliances
- Modernizing and installation
- Non-residential installations
- Wiring motors
- Wiring schools and churches
- Wiring offices
- Wiring stores

Radio and T. V. Service Option

- The superheterodyne receiver
- The pentagrid converter
- The I. F. amplifier
- Commercial receivers
- Side band receivers
- Power supply - portables
- The auto radio
- The F. M. receiver
- Communications receiver
- Transistor radio receivers
- Lab procedure
- T. V. controls and adjustments
- Vertical sweep circuits
- Horizontal sweep circuits
- High voltage section
- Damper circuit
- Deflection circuits
- Synch circuits
- Video amplifiers
- PIX IF amplifiers
- A.V.C. circuits
- Sound circuits
- Power supplies
- Tuners
- Sweep and marker generators
- Alignment
- Antennas

Suggested Tools and Equipment
for
Introduction to Electricity/Electronics
and
Basic Electricity/Electronics

The equipment and tools for teaching the beginning phases of Electricity/Electronics should be purchased in sets. Each set will accommodate the needs of two students. If a class of 15-16 students is planned, 8 sets would be required; for 20 students, 10 sets would be required.

Basically, the equipment is referred to as "breadboard" type equipment. This involves a board to which may be attached any of the various Electricity/Electronics components to be temporarily wired into a functioning circuit.

The following items should be included in each set. The prices listed are approximate and will vary according to manufacturer and quality level:

Breadboard and Test Equipment

Quantity	Description	Total Price
1	Basic-type electricity/electronics "breadboard" set	$ 225.00
1	Extra "breadboard" base	10.00
1	Regulated power supply	100.00
1	Wide band D. C. oscilloscope with probe set	175.00
1	Signal generator: 1 audio, 1 RF (or combination)	200.00
1	Vacuum tube voltmeter with probe sets	65.00
1	High sensitivity VOM with probe set	45.00
	Total	$ 820.00

One each of the following tools should be purchased and placed in a kit. One kit should be placed at each station and should be used by the two students assigned to this station. If a class of 16 is being planned for, eight (8) tool kits should be purchased.

Student Tool Kit

Quantity	Description	Total Price
1	Long nose pliers, 6"	$ 2.55
1	Diagonal cutters, 6"	2.78
1	Combination pliers, 6"	.94

Student Tool Kit (Cont'd)

Quantity	Description	Total Price
1	4" Screwdriver, blade length 2", diameter of blade, 1/8"	$ .18
1	8" Screwdriver, blade length 4", diameter of blade 1/4"	.78
1	2 3/4" Screwdriver, blade length 1 1/4", diameter of blade 3/16"	.45
1	7 3/4" Phillips screwdriver, blade length 4"	.87
1	1/4" Spintite	
1	Pencil soldering iron, 55 watts, 8 3/16", overall length	6.94
1	1/4" Soldering tips	.57
1	Wire stripper and cutter	.89
1	Soldering aid with plastic handle	.25
	Approx. cost per set	$ 17.20

General Tools and Equipment

Quantity	Description	Total Price
1	Curved nose pliers, 5 1/2"	2.93
1	Short chain needle nose pliers with cutters	2.52
1	Electrician's side cutting pliers, 8"	3.12
1	Channel lock pliers, 10"	2.63
2	7 1/2" Screwdrivers, blade length 5", diameter of blade 5/32"	.90
1	10" Screwdriver, blade length 6", diameter of blade 1/4"	.84
2	6 3/8" Phillips screwdrivers, blade length 3"	1.38
2	10" Phillips screwdrivers, blade length 6"	2.34
2	Double-end Del prier hex iron core tool, .100 hex	.90
2	Double-end del prier hex iron core tool, .125 hex	.90
2	I.F. alignment screw	.72
2	I.F. alignment screwdriver	1.32
2	Oscillator alignment tool	2.28
2	K-tran alignment tool	1.14
2	Dual-heat professional gun, 100/150 watts with 7135 tip	19.42
1 set	Sloyd knives, 3 1/8" blade	1.15
1 set	Retractable steel rule, 12' chrome clad	2.25
1 set	Electric grinder (bench type) single phase	139.00
1 set	Machinists' vises with swivel base, jaw width 3", max. opening, 4 3/4"	31.68
1 set	Files	8.00
1 pr.	Pointed steel scissors, 6" length	1.00
1 pr.	10" tin snips	
2 sets	Screw and nut driver sets	11.94
1 set	16 oz. Hammers	3.50
1 set	8 oz. Soft face hammers	2.50
3 sets	Center punches	2.70
3 sets	Prick punches	1.80

General Tools and Equipment (Cont'd)

Quantity	Description	Total Price
1 set	Chassis punches, 1/2" to 1 1/4"	$ 5.00
1 set	Electric drills, 1/4" cap., heavy duty	49.50
1 set	Cold chisels, 4 sizes 1/4", 3/4", 1/2" and 5/8"	2.80
2 sets	Hack saws, adjustable 10", 12" with rigid frame and complete reinforced handle	7.70
1 set	Crescent wrenches, 4"	1.79
	6"	1.81
	8"	2.07
	10"	2.63
1 set	14 piece roll of combination wrenches, 3/8" to 1 1/4"	19.79
1 set	Tap and dies, complete	32.95
1 set	High speed drills, 1/16" thru 1/2" by 64th's 29 drills in metal index	29.95
1 set	Allen wrench set	2.00
1 set	Tube-pin straightner 7-pin & 9-pin	2.00
1	bench model drill press	
	Total	$ 408.85

The approximate equipment costs for initiating classes in the basic phases of Electricity/Electronics would be arrived at in the following manner:

For 20 students

10 sets breadboard & test equipment @ $820.00 per set	$ 8,200.00
10 student tool kits @ $17.20	172.00
1 group of general tools and equipment	408.85

Approx. total equip. cost $ 8,780.85

Although the advisory craft committee should determine the actual equipment used in the advanced phases (options) of Electricity/Electronics, lists are attached hereto, to give administrators some insight as to the equipment and approximate cost involved to prepare for the different options.

It should be noted that the equipment for these options need not be purchased at the same time as the equipment for the basic phases. Students will require at least one year (possibly two - according to the course plan) of preparation before they will be ready to study in the option areas.

Suggested Tools and Equipment
for
Electric Appliance Repair
(15-20 students)

Quantity	Description	Total Price
1	Air compressor, 1 H. P., 3 phase, 220 volt motor	$ 190.00
1	6" Grinder with safety guard, 1/3 H. P., 1 phase 115-volt motor, 3450 R.P.M.	40.00
3	Machinist's vises, 5 x 3", 5 x 4" jaws	75.00
1	1/2" Electric drill, 115 volts	35.00
2	1/4" Drill	26.50
1	High speed drill set, 1/16 to 1/2"	14.00
6	6 x 11" Face shields for protecting eyes	13.80
1	Electric arc welder, 200 amps.	175.00
10	5-piece screwdriver set	21.60
5	Nut driver sets	22.15
3	6" adjustable wrenches	5.11
3	8" Adjustable wrenches	5.97
3	10" Adjustable wrenches	7.50
1	Electric circuit tester	1.29
2	18 piece hex wrench set	2.60
1	20,000 ohms/volts, volt ohm meter	60.00
10	Electrician's plier set (pliers, side-cutters, and duckbill)	47.90
1	Volt-ammeter	66.70
6	Machinist's hammers, 8 oz.	13.20
3	Machinist's hammers, 1 1/4 lbs.	9.00
3	Hacksaws	8.43
2	Hammers, Eswing	7.48
4	Pliers, Channelock type	9.60
1	Level, Torpedo	2.96
1	Phillips screwdriver	1.15
1	8" pipe wrench	1.73
1	10" pipe wrench	2.28
1	14" pipe wrench	3.12
1	Socket set, 7/16 to 1 1/4"	16.25
1	14-piece combination wrench set (open and boxed ends) 1/4 to 1 1/16"	14.50
1	16-piece socket set 7/16 to 1 1/4", 18 point sockets, 1/2" sq. drive	16.25
1	11-piece 3/8 to 3/4" socket wrench set	8.25
1	Bell-ringing magneto for testing	15.00
	Approx. total price	$ 939.32

Suggested Tools and Equipment
for
Electric Motor Rewinding and Repair
(15-20 students)

Quantity	Description	Total Price
1	Coil winding machine with motor	$ 685.00
1	3-phase coil winder head	175.00
1	Combination single & 3-phase winding heads, baseholder and forms	200.00
1	Baking oven, electric	630.00
1	Parts cleaner, 60 cycle, 1 phase	239.00
1	Growler, 1 phase, 115 volts	33.00
1	Electric soldering iron, 300 watts, 115 volts	17.60
1	Insulation creaser and cutter	85.00
1	Rawhide hammer #0	1.89
1	Rawhide hammer #1	2.55
1	Rawhide hammer #2	3.11
1	Lamping pliers, complete set	15.00
1	Terminal pliers	5.10
1	Lathe with motor switch and other attachments, 10"-1-1/16 (Engine)	1,800.00
1 set	Reamers in metal box: contains 1/2, 5/8, 13/16, 3/4, 11/16, 1" reamers	90.00
1 set	Wrenches, Spintite	6.15
1	Automatic wire stripper	5.75
1	Air compressor, 1 H.P., 3-phase, 220 volts	184.73
1	V. O. meter, similar to Simpson #260	60.00
1	Voltmeter, 0-600 volts	66.00
1	Ammeter, 0-150 amperes	66.00
1	Drill press, with motor	120.00
2	High speed press, 23 tons	150.00
1	100-pound anvil	25.00
15	Pliers, as Klein #201-8NE	52.50
15	Diagonal pliers, as Klein #220-7	42.45
15	Machinist's hammers, 1 lb.	33.00
15	Screwdrivers, 8"	26.40
15	Screwdrivers, 4"	7.95
15	Screwdrivers, 10"	15.15
3	Machinist's vises, 5 x 3, 5 x 4, 3 1/2 x 4	75.00
1	Socket set, 7/16 to 1 1/4"	16.25
1	Combination wrench set, 14 piece, (open and boxed ends) 1/4 to 11/16"	14.50
1	16-piece socket set, 7/16 to 1 1/4", 18-point sockets, 1/2" sq. drive	16.25
1	11-piece socket wrench set, 3/8 to 3/4"	8.25
1	Bell-ringing magneto for testing	15.00
1 set	Screw wrenches, as Allen	2.00
1	Wire gauge	4.00
3	Micrometers, 0-1, 1-2, 2-3"	49.98
3	8" Adjustable wrenches	5.97
3	10" Adjustable wrenches	7.50

Suggested Tools and Equipment (Cont'd)

Quantity	Description	Total Price
1	Grinder, 1 H. P., 3 phase, 220 volt motor - 7-8 in. capacity	$ 190.00
1	Electric arc welder, 200 amperes	175.00
1	2-lb. machinist's hammer	2.50
3	Pump oil cans	4.50
1	Soldering gun, 250 watts	12.50
1	Tap & die set, small	8.50
1	Tap & die set, large	59.95
	Approx. total price	$ 5,510.98

Suggested Tools and Equipment
for
Electrical Installations
(15-20 students)

Quantity	Description	Total Price
1	1/2" Electrical drill, 115 volts, reversible	$ 34.95
2	Keyhole saw, as Douglas #100	6.60
3	Hammer, as Eswing # E165	8.22
15	Pliers, as Klein #201-8N.E.	52.50
15	Grips	7.95
2	Knives, as Utica #260	3.00
15	Needle-nose pliers, 7"	40.95
15	Pliers, as Channelock #420	36.00
2	Torpedo levels, as Douglas #509	5.92
6	Hacksaws	16.86
6	Bit braces, 10"	34.02
1	Bending tool (1/2" EMT)	3.00
1	Bending tool (3/4" EMT)	4.70
1	Bending tool (1" EMT)	8.00
15	Screwdrivers, 8"	26.40
15	Screwdrivers, 4"	7.95
15	Screwdrivers, 10"	15.15
15	Screwdrivers, 3"	15.15
7	Phillips screwdrivers, as #2753	7.35
15	Offset screwdrivers, as #671	8.40
1	1/4" drill, as M. F. #1040	13.25
1	Hand saw	5.00
6	All-steel wood chisels, 3/4"	9.24
6	Tang-Bull wood chisels, 1"	14.16
6	6-ft. steel rules	5.34
10	Extension rules	21.00
1	50' Steel tape	4.12
1	Fish tape reel and puller, 50'	5.00
1	Knockout punch set	12.00
1 set	Unispar auger bits, #21 Electrician	
	solid-center bit, size 10/16	2.00
	solid-center bit, size 11/16	1.50
	solid-center bit, size 12/16	1.50
1 set	Unispar auger bits, #18 Power Electrician	
	size 11/16, solid-center	2.00
	solid-center bit, size 12/16	2.10
	solid-center bit, size 13/16	2.20
2	Solid-center bits, size 5/8 x 18" long, electrician's bit	5.00
1	Wrench, 6", as Klein #500-6	1.80
1	Voltage tester, Square D	10.00
1	Volt-ammeter, as Amprobe RS #1	75.00
2	Pipe wrenches, size 10"	5.70
2	Pipe wrenches, size 14"	7.60
2	Pipe wrenches, size 18"	11.00
2	8' wooden electrician's stepladders	24.00
1	20' wooden extension ladder	35.00
1	Testing magneto for shorts and grounds	15.00
	Approx. total price	$ 633.58

Suggested Tools and Equipment
for
Radio and T.V. Service
(15-20 students)

Quantity	Description	Total Price
1 set	Chassis punch (round) 1/2", 5/8", 3/4", 7/8", 1"	$ 11.45
1	Chassis punch (square) 5/8"	4.90
1	Tap and die set, as Hanson	27.95
1 set	Nut and driver set (for instruction) as Xcelite #99 Pr	8.65
6 sets	Nut and driver set, as Xcelite #127	38.70
2 sets	Hex - spline key set, as Walsco	2.64
1	Metal nibbling tool, as Adel	3.85
12	Needle nose pliers, as Kraeuter	26.40
12	Diagonal cutters, as Kraeuter	35.28
2	Aviation snips 10", straight cut	6.46
1	10" left-cut snips	3.23
1	10" right-cut snips	3.23
30	Trainer slide rules (4' Trainer free)	58.50
1	Drill bit set, 1-60 with stand or case	23.60
1	21 pc. 3/8 drive socket set	15.00
1	Power shear, as Burke	70.00
2	1/4" drills	30.00
10	Solder guns, as Weller #8200	45.60
2	Solder irons, 200 watts	20.30
1	Power nibbler, Skil model 566	50.00
1	12" Box & pan metal brake	175.00
10	8" Combination plier	10.00
2	Combination wrench sets, as Thorsen BOE 14	33.32
1	Signal generator, as Triplett	99.50
1	Oscilloscope, as RCA model WO-91A	239.50
1	5" Handiscope	144.95
4	V.O.M., as Simpson model 260 series 4	195.80
2	V.O.M. (wired), as Eico, model 565	59.90
2	V.T.V.M., as R.C.A. model SR Voltohmist	115.90
1	V.T.V.M., as Hickok model 209B	239.50
1	Load check appliance tester, as Hickok model 900C	126.75
1	Volt - amp - wattmeter, as Simpson model 390	39.50
2	Resistor - capacitor substitution box (wired), as Eico	29.90
2	Rectopower supply model, as Mallory model 12 RSDF	119.90
1	Tube tester, wired, as Eico model 628-X	44.95
1	Tube tester, as B & K model 700	166.55
1	Picture tube tester & rejuvenator, as B & K model 445	73.45
1	Adaptor for color - 110° deflection tubes	9.95
1	Transmulator, as Sprague model LF-1	79.50
1	Resistance - capacity ratio bridge kit, as Paco	20.95
1	Vibradaptor	2.69
1	Sweep & marker generator, as Hickok model 615	359.50
2	Signal tracer (wired), as Eico model 145	65.90
1	Dip meter, wired, as Eico model 710-K	49.95
1	C.R.T. tester, wired, as Eico model 630	27.95
1	V. O. M. & ammeter set, as Triplett	64.50
1	Electrical demonstration unit, as Universal 1000	260.00

Suggested Tools and Equipment (Cont'd)

Quantity	Description	Total Price
2	Ball pein hammers, 1/2 lb.	$ 7.00
4	Screwdrivers 1/4" x 12"	3.60
2	Screwdrivers 1/8" x 4 1/2"	.66
2	Screwdrivers 1/8" x 10 1/2"	1.08
2	Screwdrivers 3/8" x 12 1/8"	2.76
1	Phillips screwdriver 4"	.39
1	Phillips screwdriver 6"	.75
1	Phillips screwdriver 13 3/4"	1.17
1	Phillips screwdriver 10"	1.17
1	Drill & wire gauge (1-60)	1.34
1	1" Micrometer, as Hanson 120	10.95
1	Hand reamer	1.19
2	Chassis cradle	14.70
2	Half round files 8"	2.50
2	Round files 82 second cut	1.60
2	Files 10"	1.50
2	Hack saw w/blade	5.00
3	Bench vise, as Columbian 603M2	95.04
1	Bench grinder	135.00
2	Compass saws, as Diston #402	2.40
4	Center punches, as Stanley 494	2.80
3	Combination squares, as Stanley	9.75
1	RPM indicators, as Starrett #104	5.00
1	Armature growler, as B & G model 1409	40.00
	Approx. total price	$ 3,688.35

ELECTRICITY/ELECTRONICS

Recommended Text and References

It will be necessary for each student to have books for each area. In addition, a library should be established and maintained in the related study classroom. The library should include three or four good encyclopedias and a good selection of other reference books.

The State Supervisor of Trade and Industrial Education should be contacted for a list of books that will meet these needs.

Pub Date - Jul64 12p.

PROGRAM GUIDES; PROGRAM PLANNING; *ADMINISTRATOR GUIDES; *TRADE AND INDUSTRIAL EDUCATION; *METAL MACHINING OCCUPATIONS; HIGH SCHOOLS

This program guide is to aid school administrators in planning facilities for trade preparatory courses in machine shop in secondary schools. It was developed by the State Staff for Trade and Industrial Education from the recommendations and suggestions of trade preparatory teachers. The program objective is to develop in the student the necessary skills, technical information, and job judgment required for employment as an advanced learner in the machine trades. The suggested course of study requires 3 hours per day, 5 days per week for a 2-year period and covers units such as related math, blueprint reading, engine lath, drill press, planer, turret lathe, and universal grinder. The students should have achieved a level of maturity expected of any beginning worker, have completed eight high school units, and have scored satisfactorily on a standardized intelligence test or the General Aptitude Test Battery. Upon completion of the training, the students should be employable as apprentice machinists. A basic equipment list for a class of 15 to 20 students is suggested, but the complete and detailed list of equipment should be developed by the local advisory craft committee and the instructor with the approval of the local administrator. The physical facility should be a self-sustaining unit with a recommended floor space of 6,160 square feets. (HC)

PREFACE

This planning guide has been developed to aid school administrators in planning facilities for conducting Trade Preparatory classes.

The recommendations and suggestions contained in this guide are a composite of the thinking and practices of the Trade Preparatory instructors who are now teaching in the secondary schools of North Carolina. The State Staff for Trade and Industrial Education has compiled this information and put it in its final form.

It is hoped that through its use adequate facilities will be provided wherein effective programs of Trade Preparatory Training can be conducted.

Charles D. Bates

Charles D. Bates, State Supervisor
Trade and Industrial Education

MACHINE SHOP
(Machinists - 4-75.010 and .120)

Introduction

Almost every product of American industry contains metal parts or is manufactured by machines made of metal parts. Many of these metal parts are made by machinists and machining workers who make up the largest group in the metalworking trades. A machinist can set up and operate most types of machine tools. In addition, he must be able to read blueprints, interpret specifications, estimate materials, and use proficiently all hand tools and instruments of the trade.

The students, upon completion of this course, should be employable as apprentice machinists. Upon completion of apprenticeship training, these students will be employable in one of the many machine trades. These would include such occupations as:

All-round Machinist (D.O.T. 4-75.010 and .120)

Machine Tool Operators (D.O.T. 4-78.000 through 589 and 6-78.000 through 589)

Tool and Die Makers (D.O.T. 4-76.010, 040 and .210)

Instrument Makers (mechanical) (D.O.T. 4-75.130)

Set-up Men (machine tools) (D.O.T. 4-75.160)

Layout Men (D.O.T. 4-75.140)

For additional lists and definitions of machine trades occupations, consult the Dictionary of Occupational Titles.

MACHINE SHOP

(Machinists - 4-75.010 and .120)

Objectives

1. To develop the necessary skill, technical information, and job judgment required for employment as an advanced learner in machine trades.

2. To provide basic experience such as may be applied to other closely allied metal trades.

3. To develop safe, orderly and reliable work habits.

4. To develop an appreciation and understanding of the work done by other crafts and how this work fits into manufacturing, fabrication and the other metal trades.

As new methods, materials, equipment, tools, and labor saving devices are introduced into the machining trades, it becomes increasingly important that annual evaluations of course content be made to be certain that this training is developing the type of craftsmen competent to meet the needs of this dynamic trade.

ADMISSION REQUIREMENTS

The applicant requesting admission to this course should have achieved a level of maturity expected of any beginning worker. He should show evidence of having satisfactorily completed eight high school units. It is desirable that at least two of the eight units be in mathematics; two shall be in English and one shall be in science.

The applicant shall be of average intelligence or above, and should show evidence that he has scored satisfactorily on a standardized intelligence quotient test or make a qualifying score on the General Aptitude Test Battery. For this field of work, he should be mentally alert, physically fit and possess the interest and ability to profit by the experience he will receive. These factors will be determined by tests and interviews administered by the guidance center and/or administration.

The teacher in charge of the course shall conduct the final interview and upon the basis of this interview and the student's test profile, he shall make whatever recommendations are necessary. If all of the above mentioned information leaves any doubt in the teacher's mind about the applicant's ability and intention, he may recommend that the applicant be admitted for a probationary period. This period is to be terminated at the teacher's request.

HOUSING AND PHYSICAL FACILITIES

Adequate space is a prime requisite in establishing a vocational training program. Inadequate space creates safety hazards and impairs instructional efficiency. The shop should be a self-sustaining unit, free of inside obstructions. Maximum flexibility can be achieved with the use of non-load-bearing walls. Recommended sizes of the required space needs are listed below:

1.	Work area	4,000 sq. ft.
2.	Tool room	400
3.	Storage	450
4.	Office	150
	*Subtotal	5,000 sq. ft.
5.	Related classroom	750
6.	Restroom	150
7.	Shower +	110
8.	Locker room	150
	Total	6,160 sq. ft.

*Subtotal - This will meet space requirements if provision is made elsewhere for items #5, 6, 7, and 8.

+ - Highly desirable, not absolutely required.

COURSE OUTLINE FOR
MACHINE SHOP CLASSES

The course of study for Machine Shop requires three hours per day, five days per week for a two year period in the following units:

- Related math
- Blueprint reading
- Measuring instruments
- Bench operations
- Engine lathe
- Shaper
- Surface grinder
- Milling machine
- Drill press
- Bandsaw
- Forge
- Welding
- Buffing
- Planer
- Turret lathe
- Universal grinder

MACHINE SHOP EQUIPMENT

(15 - 20 students)

The equipment herein listed is basic to this area of training. This list is incomplete and should be considered only as a beginning. The complete and detailed list of equipment should be developed by the local advisory craft committee and instructor with the approval of local administration. All equipment and supplies purchased should conform with the instructional program.

The prices of items listed on the following page are approximate. Trade names are used merely to describe a type of machine. The purpose of the two sets of prices is to indicate that a machine shop need not be equipped exclusively with surplus or new equipment. Variations can be noted in equipment sizes and units included in one list and omitted from the other.

The purchase of "surplus equipment" is not normally recommended because of incompleteness or obsolescence. However, with the careful selection of surplus items, the total cost of developing a well equipped machine shop can be drastically reduced.

If the equipping of a machine shop with surplus equipment is contemplated, the following points should be considered.

- Items considered for purchase should conform with the advisory committee's recommendations.
- Age, condition, and completeness of equipment determine the fiscal and educational value of a machine.
- The size of a machine does not determine its educational value. If the machine is too small, it is inadequate; if too large, it wastes valuable training space and costs excessively to operate, maintain and supply with practice material.
- Purchasing surplus equipment will require considerable time and frequent trips by someone who is well acquainted with machine shop equipment.

<u>Budget note:</u> It is suggested that after the original equipping of this shop that an annual budget of $600 to $1,200 be established. This will help to keep the shop equipment up to date and in good repair. This in turn strengthens the instructional program.

MACHINE SHOP EQUIPMENT
(15 - 20 students)

Complete shop with all new equipment						Complete shop with surplus and new equipment	
Total Price	Unit Price	Item No.	Quantity	Description	New or Surp.	Unit Price	Total Price
$ 8,400.00	$ 1,200.00	1	7	10" Lathes, fully equipped			
		1	7	13" Lathes, fully equipped	N	$ 3,500.00	$22,500.00

150.00	150.00	16	1	Gas welding outfit	N	150.00	150.00
300.00	300.00	17*	1	Electric welding outfit	S	100.00	100.00
3,000.00	3,000.00	18		Precision measuring tools & cutters	N	3,000.00	3,000.00
500.00	500.00	19		Storage equipment	N	500.00	500.00
** $33,515.00							** $31,175.00

*These are standard machine shop units. Whether or not they should be included should be determined by the local advisory craft committee which should keep this course directed to meet local needs.

**With careful selection of surplus and new equipment, in combination, the total cost can be considerably reduced.

MACHINE SHOP

Recommended Texts and References

It is suggested that enough books be purchased so that each student will be supplied with a machine shop math textbook, blueprint reading textbook, and a general machine shop textbook.

Additional books involving various phases of machine shop work and training should be purchased to establish a library for reference work for these students.

The State Supervisor of Trade and Industrial Education should be contacted for a list of books to meet these needs.

VT003550

Introduction to Vocations (IV) is a new course instituted in the ninth grade curriculum in selected schools in North Carolina. The course familiarizes the student with the world of work, economic factors related to labor, current employment trends, and training requirement for the several careers. In addition, students were tested to determine aptitudes and vocational interests. Scores were explained, discussed, and correlated with information acquired about occupation. Low concepts of self as workers, occupational misfit, and constant revision of employment needs and trends within the economy of the United States were sufficient justification for offering the course.

IV teachers were selected by their superintendents to attend a summer training institute. Teachers were recruited largely from vocational agriculture, industrial arts, home economics, and guidance fields. Supervisors of the project planned two approaches to the IV course. One was to be the individual teacher instructional plan and the other was to be a team approach involving the IV, English, mathematics, and science teachers. The summer training institute, therefore, included subject matter specialists, also.

The outline for the course was developed by H. E. Beam. Lesson plans and activities were contained in it. The teachers discussed and implemented the several ideas presented in the outline. During the academic year 1963-64, the teachers could orient themselves to the several IV topics by using the outline. Wide latitude was provided the teacher, however, to elaborate upon the outline and to introduce new ideas.

Plans were made in August for evaluating the outcomes of the project. The questions one asks limits the kinds of information the research worker will be able to obtain. While there are many possible outcomes to evaluate, only a few were selected for study. As a result many knowledge and attitude changes were not studied at all.

Certain beliefs guided the phrasing of the research questions. It was believed that the IV course would make such an impact on the students that he will become more serious as a potential worker. Changes in aptitudes and vocational interests, therefore, were predicted. Vocational thoughts of the young adolescent are known to be a result of fantasy and wishing. It was predicted, therefore, that a fact oriented occupational information and self inventory course would develop more realistic thoughts about the world of work. The course, it was further expected, would become more concerned with the features inherent in their career choice than with irrelevent factors. Educational requirements of careers were to be more easily grasped. Greater awareness of the joys and dangers of careers was anticipated. A more active seeking of occupational information was expected. For that matter, vocations were to be orienting foci of the students' lives. Achievement in the course, it was believed, could be explained on the basis of known characteristics of the students. Team teaching, it was hypothesized, would yield better achievement results than the individual approach. Because of the multidimensional nature of this project and because computer programming has advanced markedly, many interrelationships could be found even though they were not intentionally sought.

Growth in knowledge and changes in attitudes appear to take place as a function of time. It was impossible to determine whether the outcomes of the course were realized if a second group similar to the IV students received no training. The superintendents of schools offered in addition to IV students comparable students to serve as a control group. Statewide, it may be said that there were few initial differences in aptitudes and interests between the two groups.

The validities and reliabilities of the tests used were designated to point out the degree to which the findings presented may not be completely faithful or accurate. Chance factors, it is well known, operate in any testing situation. They cause the observed test scores to fluctuate around the true scores. The tests used in this study were the Multiple Aptitude Tests (MAT); The Picture Interest Inventory (PII), Standardized tests published by the California Test Bureau, the Business Information Survey (BIS), My Career, and the final survey, unstandardized tests developed by the writer especially for this project. The MAT measure specific aptitudes like verbal, spatial and numerical. PII yields scores on vocational interests in interpersonal relationships, mechanics, nature, business, words, and numbers. BIS yields two types of scores: Objective and Subjective. The Objective scores reveal the degree to which the students' ordinal arrangements of seven major career groups agree with their actual arrangements for employment opportunities, mental ability requirements, earnings, and prestige. The subjective scoring key reveals the degree of relationship of the students' arrangements of the careers with his own career plans. My Career reveals the kinds of careers students plan to enter, reason for entry, educational requirements, traits required, joys and dangers anticipated, and steps taken to

learn about the career. The final survey was a series of true-false items about economics, occupations, and other facets of the world of work. Items were taken from the content of the IV courses taught throughout the State.

Students were tested at the beginning of the academic year and again seven months later. The second set of scores were compared with the first. Changes in aptitudes and interests of both experimental and control groups were not different from chance. High group scores on pretests were lower on retests; low pretest scores were higher on retests. This is the familiar "regression toward the mean" phenomenon which takes place during retests merely due to the original statistical deviations or errors which cause scores to fluctuate. The hypotheses dealing with improvement in the IV group in aptitude and interests were not tenable. The individual members of the IV group did change considerably in their aptitudes and vocational interests. These changes for individuals far exceeded changes made by the individuals in the control group. Greatest changes were noted for the following characteristics: aptitudes for arithmetic reasoning, applied science and mechanics, and interests in mechanics, business, esthetics, science, words, numbers, period of career training.

These findings should be viewed in the context of the scores originally obtained on the two groups. In reference to the national average, the groups were above average for the following aptitudes: word meaning, arithmetic computation, applied science and mechanics, and spatial relations - three dimensions, but below average in paragraph meaning, arithmetic reasoning, and spatial relations - two dimensions. The vocational interests at or above average were inter-

60

personal relationships, nature, words; below average were interests in mechanics, business, esthetics, science, numbers, and time perspective. The low reading comprehension scores, moreover, confirm the teachers judgment that students were inadequate. To explain achievement on the final survey, the several aptitude and interest scores were examined. Although all correlations explained achievement in the course to a far greater extent than did any of the aptitudes, including reading ability. While the data obtained could not be said to explain all achievement in IV, they nevertheless provide clues to the importance of initial vocational interests in attaining the goals of the course. Team teaching, contrary to the hypothesis, was not observed to influence the achievement test scores any more than did the individual approach. Size of school, moreover, was also not found to be related to scores on the achievement test.

To study the subjective factors associated with vocational interests, the My Career inventory was administered to control and IV group in September and again in April. Few differences appeared between the two groups and between administrations. The category most frequently chosen was professional; next, technical; next, operative; next, clerk; next, service; next, farm owner; least, merchant. Between administrations, the control group was found to be more consistent. That is more career choices changes in the IV group. The career group to which the IV students switch is the "professional." With respect to the training requirements for the career, there appeared to be few differences between the groupd. Most students have general and relevant information about their choices. Next to be considered was the maturity of reasons for selecting a career, there was a slight, but statistically significant

tendency for the IV group to give more mature reasons for selecting their careers. Although many of the reasons for both groups were similar, the IV group gave more reasons for entering a career than were related to inherent features of the job. The IV group cited "personality" as the most important trait necessary for their chosen career. "Personality" was also cited as the major trait necessary but absent. The IV group, in addition, was more aware of dangers inherent in the job. Career choices were discussed most often with members of the family. The IV group tended more to discuss their plans with teachers and counselors than did the control group. The IV group tended to do more reading about their vocational choices. Finally, the alternative choices were compared with original choices after all careers were rescored according to Roe's system of classification. The IV group was observed to select alternative choices of the same level of responsibility; whereas, the control group selected alternative choices of different levels of responsibility. In addition, more IV students selected the same field of interest. This was observed less often in the control group.

Some common factor was believed to account for the judgments of earnings, openings, mental ability requirements, and prestige of the careers. This was determined on the basis of rankings of these attributes on the Business Information Survey. Receiving the lowest rankings on these attributes were the service careers, moderate rankings were received by the clerk and operatives, higher by the technicians, and the highest by the professions.

It had been hypothesized that the IV group would become more realistic in the perception of the several attributes of the world of work. Five of these attributes were examined in the BIS. The

differences between the IV and control group both at the beginning and end of the academic year were generally negligible, making such hypothesizing untenable. The career entry plans for the IV group was more closely to the perception of job openings than those of the control group. Although the hypotheses concerning the added perspective of the IV were not substantiated, several observations were made which add to our understanding to the prevocational behavior of adolescents. The ninth graders understood fairly well what were the relative positions of the several careers with respect to earnings, job openings, and mental ability requirements for careers. Their grasp of the ordering of the careers according to prestige was fair. The number of people employed in the several careers was not known to them. The subjective element in judging the attributes of the several careers was quite apparent in both groups, although more obvious in the IV. The judgments about the number employed, job openings, and prestige were more closely related to personal plans for entering the careers than they were for the actual ordinal arrangements of the careers with respect to these attributes. Judgments of earnings and mental ability requirements were found to be more closely related to the correct ordinal arrangements of the careers. IV students, then, not only perceive the attributes of the world of work more in light of their own plans than of the objective reality, but they perceive them subjectively to a far greater degree than do the control students.

The IV students heartily endorsed the course. They recommended that all students be permitted to take it. When asked what they learned in the course which they could not learn elsewhere, they cited the several types of occupational information. To them the

advantages of the course was the learning about jobs and finding out what were their vocational aspirations. Few activities were disliked by the students.

The writer recommends a sharpening of the instructional approaches, emphasizing student self discovery, teaching relevant note taking, taking more field trips and assigning basic texts. Greater financial support is necessary. As important as this is, though, of far greater urgency is for the teachers to know how their students perceive their own vocational choices, interests, and aptitudes. Relating these to the educational requirements and employment openings in these careers is the zenith of the course.

Although some hypotheses were found tenable, most could not be accepted on the basis of data obtained. Yet this research has spawned several suggestions for revising the approaches to the IV class. In addition, several new facets of the prevocational behavior of adolescents were uncovered.

*OCCUPATIONAL GUIDANCE; *VOCATIONAL DEVELOPMENT; *CURRICULUM EVALUATION; ACADEMIC APTITUDE; VOCATIONAL INTERESTS; *CAREER CHOICE; TEAM TEACHING; GRADE 9; COMPARATIVE ANALYSIS; EXPERIMENTAL GROUPS; CONTROL GROUPS
NORTH CAROLINA

The purpose of the study was to evaluate the Introduction to Vocations (IV) course by use of objective and subjective tests, teacher diaries, teacher interviews, case studies, and parent judgments. Hypotheses to be tested were: (1) IV students will make greater gains in aptitudes than the control group, will become more specific in vocational interest, will become more fact oriented and less fantasy oriented with respect to occupational information, will become more stable in career choices, and more specific in stating associated factors and educational requirements of a career, and will differ with respect to statements of traits which are necessary and not necessary for a career, values resulting from work, and dangers present in an occupation, and (2) Team teaching will result in greater learning than the individual teacher approach. In 28 of the participating schools an individual teacher administered the program, and in 20 a team of teachers administered it. Both the IV students and control groups were evaluated by pretest, post-test methods. Findings were: (1) The hypothesis that IV students would make greater gains in aptitudes was not supported except on an individual basis, (2) Few differences in becoming more specific in vocational interests appeared between groups, except that IV students did give more mature reasons for their selection and made alternative choices at the same level of responsibility, (3) Differences between the groups were negligible, regarding fact or fantasy orientations with respect to occupatioal information, (4) The IV group was not more stable in career choice, (5) The IV group gave reasons for entering a career that were related to job features, cited personality as the most important trait, and were more aware of dangers inherent in the job, and (6) Team teaching did not influence achievement test scores any more than did the individual approach. This report is dedicated

to

Dr. Gerald B. James

a dynamic leader in vocational education

in

North Carolina

ACKNOWLEDGMENTS

Under the supervision of Dr. Gerald James, Director of the Division of Vocational Education, North Carolina Department of Public Instruction, a new course in the Introduction to Vocations (IV) was designed to promote awareness of self. Better understanding of self and of the world of work by ninth graders were its aims. Mr. Thomas Shore, Mr. Charles Law and Dr. Harry Beard not only participated in the planning of the program but contributed to its realization.

The writer's function was to evaluate the program. This report is its fulfillment. Utilized herein are results of objective tests, subjective tests, teacher diaries, teacher interviews, case studies, and parent judgments. The writer is greatly indebted to the teachers who, despite considerable teaching loads, gave their time freely to this project. Their own evaluations of the IV program was weighed heavily in this report.

The tireless efforts of the IV research staff should not go unnoticed. Mrs. Sylvia Barnes, research instructor, N. C. State of the University of North Carolina at Raleigh, at considerable sacrifice to her family, gave abundantly of her time for the good of the project. Appreciation is given also to Mrs. Nancy Cooke, James McKinney, and Miss Sarah Blizzard who served on the research staff. Messers Steve Harris and James B. Jones of the research staff of Operation Second Chance donated their time so that the IV project could be completed on time.

Many others contributed indirectly to the success of the project. They are too numerous to mention. An especial citation of gratitude must be given the N. C. State Computing Center, who pressed for time on other projects, donated time for the rapid computation of the results contained herein.

The writer is grateful to Drs. Charles Morehead and Roy Anderson, of the Department of Occupational Information and Guidance, for their suggestion in scoring "My Career."

Few deans have the foresight to create positions in educational research. Dean J. Bryant Kirkland has accorded the writer the opportunity to pursue freely his own research interests. This freedom is cherished.

Finally, Miss Loyce Blaylock, my secretary, deserves a note of thanks. Her services to me have been invaluable.

PREFACE

As the high school doors close behind them, thousands of adolescents in North Carolina are being catapulted, with almost jet like force, into a rapidly changing world of work. Certain jobs, especially those requiring little skill, are vanishing altogether. New careers, unknown fifteen years ago are appearing. Familiar career names are being redefined. An adolescent who as a child always imagined that he would follow the trade practiced by the family for generations finds that he has to compete for a job with a machine. Employers today not only seek the most able workers in the professions, but demand quality workmanship from the unskilled. High school students must not only be prepared to adapt the world of work today but also to adjust to constant changing of work conditions and employment markets.

The less than perfect plan for our economy intensifies the crisis of adolescents. Heard today are such questions as "Who am I?" "What job am I able to hold?" "Is there a market for my talents and interests?" Waste of human resources is quite common in our economy. More pervasive, though, is the absence of knowledge about one's own aptitudes and interests as well as of the kinds of employment opportunities which require them.

STATEMENT OF THE PROBLEM

Prior to 1909, thinking and writing about vocations was sparse and unsystematic. Parson's (1909) book on career choice was a milestone in the educational thinking about vocations. Briefly, he stated that a future worker should analyze rationally the many facets of his personality, the several aspects of his proposed calling, and the interrelationships among his propensities and occupational requirements. Two world wars catalyzed research on job adjustment. Not only were tests of aptitudes, interests, and motivation proliferated, but an information explosion has infused the several vocational guidance and education fields.

Despite the inchoate state of facts about vocations, some notable progress has been made in theorizing about vocational development. In simple societies in which vocational choice is limited, the skills necessary to practice the adult calling are learned early in life. In late adolescence and early adulthood, the members of the society merely continue practice of the skills they have already learned, say those connected with fishing, farming or hunting. In contemporary, highly technological western civilization, occupations are highly diversified. In addition, the several thousand avenues for gainful employment have experience, age, sex or race prerequisites.

To fully understand development of vocational decision making, theorists have presented networks of ideas which provide contexts for viewing the several vocational behaviors comprising maturity. One such theorist was Buhler (1933). To her the early and rapid physiological and mental development preceded the adolescent period of exploration. After he found himself, the worker established himself in a career and directed his energies toward improving himself as well as toward raising a family. Later, he narrowed his interests to those associated with success. Finally, the worker's life ended after a period of decline in productivity. Another theory is derived from the work of Miller and Form (1951). They focused on the adolescent-adult development rather than on total development as did Buhler. To them, a worker moves from an initial work period to a trial work period, during which he may hold many part time or temporary jobs; next, to the stable work period, during which he may hold but a few jobs and these of long duration; and finally, to retirement, during which he may not work at all. Ginzberg and his colleagues (1951) developed a theory of vocational behavior for boys. From the ages of 4-10 when boys first think about vocations, they asserted many of the ideas are influenced by romantic and imaginative notions. At about age eleven, a transition period between fantasy and reality sets in. During this period vocational decisions are first influenced by interests, later by abilities,

and still later by values. During late adolescence and early adulthood, the worker becomes more realistic in his vocational choices. After a period of exploration, the worker synthesizes his vocational thoughts and restricts his vocational behaviors to a career choice which combines employment opportunities, interests, abilities and values. Although the theories of vocational development differ from one another, they largely explain vertical development to be emergence of increasingly more specific and realistic vocational decisions from relatively general and vague thoughts. A period of stabilization follows in which vocational behaviors become restricted and refined. Finally, during retirement, there is a decline in vocational activity. Graphically, this may be represented:

During the period of adolescence there are two major crises which demand adjustment. The physiological changes which thrust a child into puberty and mark him physiologically an adult but psychologically not are bewildering. His confused status is exacerbated by the fact that he is suddenly transformed into an economic independent. Hitherto, he relied almost entirely on adults for mediating satisfaction of his needs. His self concept is unclear. Should he view himself as an adult or as a child? Is he to know himself as a worker responsible for his own livelihood? What vocational decisions must he make in order to be a self respecting worker with adult obligations? May he experience-economic and sexual satisfactions seemingly reserved for adults?

Deep as these crises might be and as restless as they may make adolescents in our society, the potential losses of manpower and its correlative contributions to our society and our economy are incalcuble. In addition to the anxiety related disorganized vocational behavior of the adolescent, the sizeable number of adult vocational misfits and the existence of occupational maladjustments is cause for grave concern. Counseling, according to Super and Crites (1962) could contribute to the improvement of vocational adjustment as well as of our economy through the effective use of manpower. Guidance personnel, however, are not in great abundance. The magnitude of the problem of adolescent vocational adjustment is so great that counselors could not possibly cope with it.

Better self understanding may be attained by techniques other than counseling. Reading, discussion, film viewing provide the adolescent with the verbal equipment to try out new solutions to his problems. Classroom instruction in vocations could be so programmed as to reach large audiences, hence, economizing on both time and money. Most school systems, Eckert and Marshall (1938) assert, lack the necessary comprehension to abet good vocational adjustment or even good citizenship. Stone (1948), however, presents data which shows that a group of adolescents who are taught information about occupations formulate sounder vocational judgments than do a similar group without such training.

Introduction to vocations was a course launched in the summer of 1963. It was sponsored and developed by supervisors at the Division of Vocational Education of the State Department of Public Instruction at Raleigh, North Carolina. The objectives of the course will be recognized as those enunciated by the Educational Policies Commission of the National Education Association and later revised by French (1954) using more recent concepts in Education.

What the Introduction to Vocations tried to achieve was, 1. the development of understanding and appreciation of the world of work, the American economic systems, and specialization of occupational roles; 2. the analysis of vocational interests, differential aptitudes and self-concepts as workers; 3. the acquisition of the knowledge of the educational requirements of jobs and availability of employment opportunities; 4. the acquisition of knowledge of the basic skills common to many occupations as well as specific to others; 5. the acquisition of knowledge about resource materials which contain information about occupations; 6. the development of tools which would permit the making of more realistic judgments about occupational preferences; and, 7. the promotion of realization of the student's vocational goals.

The present study was conducted to determine the degree to which these goals could be attained as well as to shed light on reactions to the new program. Various aspects of the personality, such as aptitudes, interests, and values change little in young adolescents, over the short span of a year. But it is also known that some adolescents will change dramatically in that time. Climactic reorganization of personality is not altogether unknown. What is yet to be clarified are the catalysts of these changes. Might a course in vocations contribute to such change? Might this course be so meaningful as to orient the adolescent toward greater vocational maturity? After the completion of the course, might his values change.

Growing into vocational maturity and developing greater realism in vocational choices are two processes which it was anticipated the IV course would accelerate. According to Super and his coworkers (1955 and 1957) vocational maturity may be viewed as the realization of age oriented developmental tasks. A second view of maturity deals with methods of coping with sociologically oriented developmental tasks, irrespective of age.

Five dimensions of vocational maturity are especially relevant here. Super lists these and has endeavored to investigate these in studies with Overstreet (1960). A ninth grader is expected to be aware of a need to make an occupational choice, even though it will not be his ultimate choice. Some tentative plans, moreover, could be expected to be drawn up. Such a plan would involve awareness of educational requirements of a job as well as duties, working conditions, and job opportunities. The vocational preferences of the ninth grader could be expected to be relatively stable. The mature ninth grader will not differ from day to day in his career choices. By the ninth grade, signs of vocational independence could be observed. Obtaining work on one's own is a sign of independence as are working for outsiders, i.e., not family members; working with a minimum of supervision; working with complex tasks; and working at the same job for a long period of time, that is infrequent changes in jobs. Finally, prudent vocational decision making at this level is to involve maximum utilization of information about self, information about jobs, and feedback from one's work experience.

The ninth grade representing an age range of several years encompasses the vocational behavioral stage of tentative choice. During this period values come into sharper focus and occupational choices become crystallized. Little vertical growth toward the stable work period or toward the specification stage of realistic choices could be expected. Developmental tasks are neither suitable nor available at this grade level. On the other hand, horizontal growth, may be observed, at this level. If sharper focus can be interpreted to mean "specificity of judgment," then, progressive differentiation of gross, unrefined decisions, could be considered an index of maturity of horizontal growth. An outgrowth of the theorizing of Snygg and Combs (1949) is education makes one more mature by refining his perceptions about the world. Evidence for the growth of maturity of judgment by educational interventions may be seen in the work of Abercrombie (1960).

No single factor has a determining influence on either vocational choice or success. Super (1957) enumerated several determinants of a career. Among the broad categories he considers are psychology, physiology, geography, sociology and

demography. Under each category, several specific traits are subsumed. He also considers some nonpredictable factors such as illness, unanticipated opportunities and unanticipated liabilities. A person's drive, family background, current social status, attitudes of the significant people in one's life, occupational structure and trends in a community are among the several determinants which he considered.

What determines career choice in one culture may yield little or no information in another. McArthur (1954) found the vocational interest inventory he used to predict occupational interest did so more satisfactorily in the middle class than in the upper class. He offered as an explanation that upper class members enter family approved occupations. Middle class members are freer to choose careers on the basis of values or interests.

The real test of any theory is how well it predicts behavior of known groups. In their study of the vocational choices of ninth grade boys Super and Overstreet (1960) do test the several aspects of their conceptual framework. Condensed here are the concepts guiding their study. They were: 1. vocational behavior is processive and develops over time; 2. with increasing age vocational behavior becomes more complex, more specific and more reality-bound; 3. there are several stages in occupational behavior, each stage requiring unique behaviors of the (future) or age earner; 4. mature vocational behavior may be assessed on a normative basis by determining what are the vocational developmental tasks in any life stage and by determining the variability among age group members in their striving for the vocational goals characteristic of a particular stage; 5. vocational adjustment may be predicted from vocational maturity; 6. several factors, mentioned above, are determinants of vocational behavior; 7. all acts practiced in an occupation need not be indicative of a vocational developmental task.

Many variables were found to be related to their Vocational Maturity Index. Among these were intelligence, parent occupation, curriculum, cultural stimulation, achievement - underachievement, independence, and vocational aspiration. Although correlations were significantly different from zero, no single variable accounted for more than .09 of the variation in the Vocational Maturity Index. Of importance was the finding that those boys who were developing plans for an occupation and who had knowledge of an occupation were better oriented to occupational choices. Specifically, concern with choice, acceptance of responsibility, and specificity of choices were interrelated. Vocational maturity of ninth grade boys, however, was in general found to exclude consideration of goal attainment and rational occupational preferences. It is difficult to reconcile these findings with most

existing theories of vocational behavior. Vocational behavior is far more elusive a characteristic to measure than might be assumed. One could ask whether formal instruction in vocational information might have altered their findings.

The term vocational realism requires explication. As used by many authors it connotes wisdom of vocational choices, an equilibrating of occupational interests with aptitudes and job opportunities. While this may be an ideal to pursue there is no formula available which would enable an individual to apply to himself. For that matter, vocational phychology has not developed to the point that a professional counselor could do more than make conjectures about the factors which will produce equilibrium for any client. Such an ideal may never be reached because what is real for one ninth grader may be fantasy or even non-existent for another. An external, objectivist point of view could yield valuable insights into the role which a course in vocations can play in changing vocational maturity. Because segments of such a course will set individual students moving in unique directions, in other words have highly personal meaning, it is equally important to examine the subjective, phenomenological impact of the course. For this analysis, the writer is greatly indebted to the works of Snygg and Combs.

It was especially important in the present study to study the ninth graders objectively as well as subjectively. The research performed by others was very persuasive on this point. In Hawaii, Dole (1961) studied the plans, goals, and values of students at different educational levels. In grade 9, 37 per cent of the boys and 51 per cent of the girls planned to go to college and 29 per cent of the boys and 25 per cent of the girls planned to go to technical school. In contrast to sixth graders, fewer students were planning college education and more students, technical education. Approximately 32 per cent of the ninth grade boys and 43 per cent of the ninth grade girls were striving for professional positions. Next highest in frequency for boys was skilled work (28 per cent) and for girls clerical work (25 per cent). These represent larger percentages of replies than those offered by sixth graders. Most sixth and ninth graders were very certain of their plans. Assuming the two grade samples are equally representative of their respective populations, it is clear that plans and occupational goals become increasingly differentiated by grade nine. The values contributing to educational choices in boys were primarily "satisfaction" and "advancement" in boys and "satisfaction" and "service to others" in girls. Parents, moreover, were mentioned as being important influences; teachers, slightly less important; and counselors, least important.

Plans and goals, however, were found by Stephenson (1957) to differ as a function of father's occupation. Ninety-one per cent of the subjects whose fathers were in the professions developed plans equal to their aspirations and 66 per cent of manager children and 68 per cent of clerk and sales children had such plans. More than half of the children of semiskilled and unskilled workers had plans lower than their aspirations. With respect to influences upon choices, Galler (1951) observed that children from the upper classes gave significantly more altruistic reasons for choosing their occupational goals. Perception of occupational goals and satisfactions could be expected to be linked with personal factors internal to the future worker as well as reactions of external observers to him. The intent of the IV course was to introduce him to these factors.

How consistent in vocational choices might the IV students be? Schmidt and Rothney (1955) found that most high school students alter their vocational preferences in a three year period. Could this be due to the fickleness of adolescents or might the future worker, in the absence of confirming information, about his self concept as a worker or in the absence of any encouragement from the environment try new fields. The intent of the IV course was to give him such information.

Realism of choices was another major concern. Well adjusted boys were found by Small (1952) to be more realistic in vocational choices than were poorly adjusted boys. Assuming the little knowledge available about interest-ability-opportunity were transmitted to students, might they then make more realistic choices? It was the intent of the IV course to promote this.

Few states have developed courses like the Introduction to Vocations. Courses in Occupational Information are given in several states. The emphasis has been primarily on teaching techniques of finding facts about self and selected vocations. The program in Hanover, New Jersey is presented here to demonstrate this approach.

OCCUPATIONS

I. OBJECTIVES

A. The primary objective is to help students make a better career choice.

1. This involves better self-understanding.
2. A knowledge of the wide variety of occupations available.
3. Information on how to study an occupation and match it with personal qualifications.

B. Another objective is to help students understand and appreciate the contribution that others make to our welfare.

C. Secondary objectives include:

1. Helping students learn how to find a job.
2. Helping students learn how to be successful on a job.
3. Providing some understanding of our economic system, including the place of labor unions.
4. Providing an understanding of the laws which influence our working life.

D. From the curriculum point of view, the objective of this course is to provide material for the non-college bound student, who finds it difficult to locate enough major courses.

II. COURSE CONTENT

A. Self Analysis (four - six weeks)

1. Interests
2. Aptitudes
3. Personality
4. Effect of family and community background on vocational choice.

B. General Survey of Occupations (six - eight weeks)

1. Material in textbook is used as basis for general survey.
   a. Variety of films were used.
2. Study of local industries, based on printed material, personal interviews with workers, and visits to companies.

C. Matching Job Requirements and Personal Characteristics (two - three weeks)

1. Each student selects one or two occupations based on previous units, and makes a report based mainly on library reading.

D. How to Get a Job (two weeks)

1. Where to apply
2. Letters of application
3. Application blanks
4. Job interviews

E. How to hold a Job (one week)

F. Labor Laws

1. Child Labor Laws
2. Workmen's Compensation
3. Social Security Laws
   a. Unemployment Compensation
   b. Old Age and Survivor's Insurance

III. ACTIVITIES

A. In addition to regular class presentation, frequent use will be made of:

1. Occupational movies
2. Field trips to industries
3. Speakers

IV. MATERIALS

A. Basic Text - Occupations and Careers, Greenleaf

B. Pamphlet - Choosing Your Career

C. Occupational material in library

D. Free and rental films

V. EVALUATION

A. Short quizzes

B. Written assignments

C. Class participation

D. Major report on chosen occupations

E. Final Examination

F. Final grade based on average of twice the grade for each marking period, plus final exam grade.

The original intent of the IV course was to correlate teaching about occupations with practice in job oriented tasks. Some participating school systems, moreover, correlated major courses like English, Mathematics, and Science with IV.

SUMMARY

Theories of vocational development suggest that ninth graders are at a period of tentative choice of their calling. Young adolescents, moreover, have been observed to alter their vocational choices. The vocational misfits and the waste of manpower necessitate determining whether more adequate self concepts as workers could be developed by giving students instruction in occupational requirements and opportunities as well as permitting them to analyze the relationships between their abilities, interests, and values and such requirements and opportunities. The questions to be answered by the research were to be what outcomes did the IV course realize.

HYPOTHESES

The Introduction to Vocations course, it was assumed, would influence many aspects of the students' lives. The objectives of the course, were understanding and appreciation of the world of work, self analysis of interests and aptitudes,

knowledge of the educational requirements of a job, and understanding of the factors promoting realistic occupational decisions. If the writer would be permitted an analogy, these objectives were to become the eyes of the students. The students would perceive relevance of every day activities, talking, reading, TV viewing, to the setting and realization of their vocational goals. Because students actively participated in discussions, readings, and evaluation of vocation related ideas it was assumed that this signified deeper involvement in vocational orientation. Now the questions may be raised, do vocationally oriented students change their aptitudes, interests, knowledge, or values significantly more than a control group receiving no formal training in vocations.

The specific hypotheses to be tested are:

1. IV students will make greater gains in aptitudes than the control group.

   The aptitude test scores to be examined are:

   1. Word meaning
   2. Paragraph meaning
   3. Arithmetic reasoning
   4. Arithmetic comprehension
   5. Applied science and mechanics
   6. Two dimensional spatial relations
   7. Three dimensional spatial relations

2. IV students will become more specific in vocational interests than the control group.

   The absolute changes in test scores to be examined are:

   1. Interpersonal interests
   2. Natural interests
   3. Mechanical interests
   4. Business interests
   5. Esthetic interests
   6. Scientific interests
   7. Verbal interests
   8. Quantitative interests
   9. Period of time for training interests

3. IV students will become more fact oriented and less fantasy oriented with respect to occupational information than the control group.

   The rankings of seven career categories for the following will be established. These are: a. earnings of the business, b. number of people in this business, c. future job openings, d. mental ability requirements, and, e. prestige of business. Rankings will be compared with objectively derived rankings for each of these five categories as well as with rankings of personal plans for entering each career.

4. In contrast to the control group, the IV group would become:
   a. More stable in their career choices
   b. More stable in alterative career choices
   c. Less concerned with tangential factors and more concerned with career inherent attributes in selecting a calling
   d. More specific in explaining factors associated with career selection
   e. More specific in stating educational requirements of preferred career
   f. More aware of dangers inherent in a career
   g. More active in seeking information about careers.
5. IV students will differ from the control group with respect to statements of:
   a. Traits present which are necessary for a career
   b. Traits not present which are necessary for a career
   c. Values resulting from work
   d. Dangers present in an occupation.
6. Team teaching approach results in greater learning than individual teacher approach. This outcome was hypothesized because several teachers with the same orientation would be more influencial than one teacher with a vocational orientation.

In addition to these hypotheses, explanations of the sought behavioral outcomes will be offered in terms of data available. Specifically, the roles to be attributed to initial interests and aptitudes in predicting course achievement will be determined. Also, the association of earnings, future job openings, mental ability requirements, and prestige with first and second career choices will be determined.

PROCEDURE

During the summer of 1963, superintendents of schools were contacted to determine their interest in participating in the Introduction Vocations (IV) program. Forty-five school systems were selected to participate. In 28 of these, the IV course was to be administered by one teacher responsible for the program; 20 IV programs in 17 districts were to be administered by a team of the English, Mathematics, Science, and IV teachers.

All teachers were selected by their superintendents. They attended orientation sessions on the campus of N. C. State of University of North Carolina at Raleigh. Invited lecturers addressed the group, field trips were taken, and phases of the

IV curriculum were discussed in small group sessions. Topics considered were the American economic system, employment opportunities, occupational requirements, and the meaning of test scores. Copies of Introduction to Vocational Education: A Suggested Course Outline (Beam, 1963) were distributed to all teachers. This booklet contained statements of the objectives for the several units of instruction as well as suggested activities for realizing them. These booklets were read by the teachers. During the academic year they based many of their teaching plans on Dr. Beam's suggestions.

After the course was completed, the superintendents of schools were requested to participate in the program for evaluating the IV course. To do so, they were to assign pupils to the experimental program and to select another group of pupils, not different from the first, as a control group. Two class days were set aside for the purpose of testing both groups: one day at the beginning of the academic year, another day toward the end.

During the month of September members of the research team administered the Multiple Aptitude Tests, the Picture Interest Inventory, Business Information Survey, and the My Career Inventory.

The Multiple Aptitude Tests (Segel and Raskin, 1959) is a standardized test which yields the following verbal comprehension scores: Word meaning and paragraph meaning; the following numerical reasoning scores: Arithmetic reasoning and arithmetic comprehension; as well as spatial visualization scores: Applied Science and Mechanics, two dimensional spatial relations, and three dimensional spatial relations.

The Picture Interest Inventory (Weingarten, 1958) is also a standardized test. It yields scores on the following interests: Interpersonal, natural, mechanical, business esthetic, and scientific. In addition, preferences for verbal oriented and number oriented occupations could be indicated. Finally, a testee could indicate his preferences for occupations varying in amount of time required for training.

The Business Information Survey (Appendix A) is a test constructed for this study. It requires a student to rank order seven career categories according to, 1. the student plan for entrance, 2. earnings of the business, 3. number of people in this business, 4. future job openings, 5. mental ability requirements and, 6. honor, prestige, and respect of business. The seven careers are clerk or salesman, farm owner, laborer, merchant, operator, professional, technician.

Rankings of items two through six were correlated respectively with objective information based on the research work of Palmer and Ratner and current population reports which appear in Baer and Roeber (1958), Stewart (1947), Murphy (1963), Miller (1955) and a synthesis of the National Opinion Research Center report (1947) with Warner (1949). Correlation of student rankings with the objective key yielded information about the student knowledge of research derived objective facts about careers. In addition to an objective key, each protocol was scored according to the order of careers which an individual respondent ranked in response to the item, "the business I plan to enter." This was the subjective key. Correlating the personal order of career preferences with his order for earnings of, number of people in, future openings of, mental ability requirements for, and prestige of business was assumed to yield information about the impact of subjective preferences upon perception of the above mentioned characteristics of careers. All ten scores, five objective and five subjective, were in rank order and since differences of a few points in correlation do not result in differences in meaning, to permit chi square tests of hypotheses the correlations were grouped into the following categories: +.75 to + 1.00, high agreement with the key; +.40 to +.74 moderate agreement, -.39 to -.39 no agreement; -.40 to -.74 moderate disagreement; -.75 to - 1.00 high disagreement. The rationale for the scoring system presented here is to be published elsewhere (Chansky, in press).

My Career (Appendix B) is an inventory of attitudes and beliefs about an individual's career choice. It was developed for this project. The questions and key are derived from the theoretical writings of Snygg and Combs (1949) and Murray (1938). My Career requires a testee to indicate the name of the career he plans to enter, the reasons for entrance, the educational requirements, the traits required which he has as well as those required which he does not have, the joys he anticipates, the dangers he anticipates, the inquiries made about this career, and finally the naming of an alternative career choice.

The questions on this inventory were developed so that one could learn about the career choice of a respondent, if he had one at all; next, what he considered in making his choice. If he stated as reasons past achievements and interests, wishes and beliefs, national needs, or family influences, these were judged "predisposing factors." If he considered a liking for objects, functions or services performed, or fringe benefits, these were judged "intrinsic factors." A third category of reasons was "consequences." It included inferences about values derived from work. One category of values was individual centered self enhancement.

Included under this category were search for security, status, general emotional pleasure, autonomy, order, sentience, achievement, exploration, simplicity, pain and escape. The other category of values was people oriented self enhancement. Included under this category was search for companionship, service to people, benefit to humanity, and finally, performance of duties in order to obtain favorable feedback from people. The degree of specificity of reason for choice was determined also. This, it was believed, would yield indications of horizontal vocational maturity. Reasons were judged: undifferentiated; vague, referrants not clear; differentiated -1: general attribute or correlated cited; and differentiated -2: Specific feature was cited. Next, the specificity and relevance of the educational requirements of the career was determined. Work habits, personality, work interests, character, ability, physical characteristics were the categories of trait requirements of the career. The scoring system for career joys anticipated is the same as for "reasons" for entry. The writer believed that vocational maturity not only involves beliefs about values to be gained in an occupation but also awareness of dangers in an occupation. Dangers were scored for the following factors: natural, inherent economic, inherent in function, inherent in self, inherent in social climate. The degree of specificity of awareness was studied, too. Dangers could be scored: a. undifferentiated, b. differentiated -1; and c. differentiated -2. An attempt was made to determine who, if anyone, was consulted in formulating plans; was it family, friend, teachers, counselors, someone in the career, or some other acquaintance? Also of interest was, what, if anything, has been done so far to obtain information about the career; did one read or study, talk with acquaintances, try the work, or observe someone in the career. Often, for one reason or another adolescents are unable to enter their chosen career. The writer, therefore, believed that a mature adolescent would have an alternative choice. The ninth graders, then, were asked to state a second career choice.

After initial testing, IV teachers were free to plan their programs. While some structure was imposed on them, namely, course objectives, there was wide latitude in selecting curricular activities for achieving them. During the academic year, most of the teachers were visited by the research staff. Teachers sent in diaries explaining their activities to the research director. Communication with the director was occasional. At no time, moreover, was there any attempt by him to influence instruction.

In April, the Multiple Aptitude Tests, the Picture Interest Inventory, the Business Information Survey, and My Career were readministered to both control and

experimental groups. In addition, the experimental group received the "Final Survey," an achievement test designed to measure understanding of the world of work. The experimental group was also invited to evaluate the course.

SUMMARY

All IV teachers were trained prior to assuming leadership in the course. Superintendents of schools were requested to select experimental and control groups. To test hypothesized outcomes of the course both groups received the Multiple Aptitude Test, Picture Interest Inventory, Business Information Survey, and My Career in September. These same tests were readministered to both groups in April. In addition, the experimental group were tested for mastery of information about the world of work. Finally, the IV students were asked to evaluate the course.

HYPOTHESES

The Introduction to Vocations course, it was assumed, would influence many aspects of the students' lives. The objectives of the course were, understanding and appreciation of the world of work, self analysis of interests and aptitudes, knowledge of the educational requirements of a job, and understanding of the factors promoting realistic occupational decisions. If the writer would be permitted an anology, these objectives were to become the eyes of the students. The students would perceive relevance of every day activities, talking, reading, TV viewing, to the setting and realization of their vocational goals. Because students actively participated in discussions, readings, and evaluation of vocation related ideas it was assumed that this signified deeper involvement in vocational orientation. Now the questions may be raised, do vocationally oriented students change their aptitudes, interests, knowledge, or values significantly more than a control group receiving no formal training in vocations.

The specific hypotheses to be tested are:

1. IV students will make greater gains in aptitudes than the control group.

   The aptitude test scores to be examined are:

   1. Word meaning
   2. Paragraph meaning
   3. Arithmetic reasoning
   4. Arithmetic comprehension
   5. Applied science and mechanics
   6. Two dimensional spatial relations
   7. Three dimensional spatial relations

2. IV students will become more specific in vocational interests than the control group.

The absolute changes in test scores to be examined are:

1. Interpersonal interests
2. Natural interests
3. Mechanical interests
4. Business interests
5. Esthetic interests
6. Scientific interests
7. Verbal interests
8. Quantitative interests
9. Period of time for training interests

THE STATEWIDE IV PROGRAM: EVIDENCE FROM DIARIES

The freedom that the teachers had to fashion their Introduction to Vocations course was frightening to some but challenging to most. The task of planning and executing a new course was arduous. More than this, the hardships endured in obtaining reading materials, films, filmstrips, and visiting speakers merely added the weighty burden that might have broken their spirit. Untrammeled, they worked feverishly to the very end. The satisfactions derived from teaching were great. The eagerness for corrective feedback for their seeming failures to influence their students each and every day is rarely observed among teachers.

The IV teachers were asked to keep daily logs of their activities and to submit them to the research director for study. These logs revealed, as would be expected, vast differences between the IV programs conducted throughout the State. To be sure each class studied economics and career requirements and opportunities. Not only did the time allocated for the study of each topic vary, but the very techniques used to bring light to the students differed.

The several IV teachers reported, almost in unison, that the problems encountered were primarily obtaining materials adjusted to the student's reading level. The reading skills of many students were inadequate to the demands placed on them by class reading and library research assignments. Not only was their vocabulary in economics too meager to grasp the elementary concepts taught, but the general vocabulary level was too low to read many of the assignments. Interest in the course, nevertheless, did not wane. To be sure, there were instances of disciplinary problems, but basically the teachers proved to the students that the IV course was about them.

In addition to deficient reading skills, the teachers reported that students practiced ineffective and even harmful study techniques. Where basic education was correlated with IV, science teachers occasionally taught the scientific method.

and English teachers lectured on how to study. The IV teachers judged these to have a salutary effect on the students. Despite assists from subject matter teachers and guidance personnel they were not completely satisfied with student performance.

In researching the impact of curriculum on students, it is important to recognize that the novelty of the change will not be the sole influence on the outcome of the course. Rather such factors as reading ability, study habits and attitudes affect the end product to a considerable degree. Hopefully, these factors exercised a random effect on the total sample and did not influence the central tendency of our results. Rather it made our groups more variable.

Following are selected highlights of aspects of the IV course detailed here to demonstrate differences in teacher approaches to the course.

System A. The class and/or teacher studied economics vocabulary prior to reading; selected careers they wanted to study; compared qualifications of different jobs; were shown film strip on budgeting; were introduced to the milk-dollar; percentage of cost and profit, e.g., local milk company; learned the advantages and disadvantages of manual and mechanical occupations; participated in ideas for occupational fair: displays, posters,charts; learned about small loans: laws, interest rates (Bank official, guest speaker).

System B. The class and/or teacher learned how to investigate occupations; studied occupational changes and trends in the State; interrelated the economic activities generated from a loaf of bread, from seed merchant to newspaper advertisement. Planned a personal budget of $50.00 @ month (buzz groups); discussed clerical, sales, service, occupations.

System C. The class and/or teacher invited a blind social case worker to discuss adjustments of the blind; correlated visit with "Shago" the story of the boy who is gradually going blind; solicited cooperation of guidance department to draw up graphs of aptitude and interest scores obtained during IV pretesting; discussed principles of flight; participated in Science Fair; considered establishing a "Candy Striper" program for the girls.

System D. The class and/or teacher went on field trip to automated dairy; reviewed observations; corrected misunderstandings; practiced scientific method: observation, possible explanations, eliminations, conclusions; considered establishing "Candy Striper" program; planned unit on stars to correlate measurement, map making, mythology, mathematics, and occupations.

System E. The class and/or teacher constructed electrical panel board; studied power industry: lineman, electrical equipment repair; studied automated devices: electronics computers; studied service careers; studied technician careers: medical technology and dietetics; discussed soil conservation.

System F. The class and/or teacher discussed incentive systems for workers; filled out sample checks; studied credit.

System G. The class and/or teacher discussed student ideas of success; discussed value of career planning; viewed film "Southern 500 stock car race" - listing of occupations connected with it from printing tickets to manufacture of tires followed; looked up classified advertisements; discussed dignity of people working in the several trades; listed all of the four year colleges in the State; read newspaper clipping about dropouts conducted mock interview: correlated with English; wrote business letter: correlated with English.

System H. The class and/or teacher discussed government services; studied money and credit; listed suggestions for job seekers; outlined career study: nature of work, mental ability requirements, restrictions, supply and demand, income, promotion, security.

System I. The class and/or teacher grouped students and designated each group an area in the State. Reports of economic conditions followed; discussed labor force and personal income; studied gross national product made, serviced or repaired some object; satisfaction in creating.

System J. The class and/or teacher discussed the meaning of success compared free enterprise with socialism; discussed rights to own property, to go into business, to retain part of one/s earnings; developed rating chart of success; imagined consequences of dropping out; determined cost of schooling; discussed its worth; discussed how to win respect; discussed how to be popular; compared white collar with blue collar; considered the personal goals being sought by students.

System K. The class and/or teacher cited rules for taking notes; lectured on relationship between dropouts and unemployment; reported on a successful person; interviewed working people; learned of their plans made prior to entry into career; produced skits comparing poor with good educational planning; traced the relationship between weather and economy, especially availability of jobs created by weather; discussed ways to motiviate students to improve their scholarship; lectured by visitor on intelligent use of credit; evaluated confidence of student speakers; discussed materials obtained from local Chamber of Commerce; discussed

weaknesses in expression of ideas; referred to workmen on school grounds in illustrating classification of jobs.

System L. The class and/or teacher administered self analysis tests; developed self rating charts; contrasted career plans today with those of a generation ago; defined satisfaction; developed gross national product and money flow charts; taught students how to write checks and how to make deposits; developed budget with $50.00 @ month allowance; wrote letters to several public and private organizations to obtain materials on modern methods of farming; were distributed kits of forestry materials; conferred with employment security, Chamber of Commerce, and representatives of business and service organizations; produced skit comparing right and wrong way for a receptionist to perform her duties; made display posters.

System M. Explained IV program; listed 20 factors limiting choice of an occupation; discussed incomes of people varying in amount of schooling; developed a budget for a family with two children; explored population of State, theme being, "There is a Future in North Carolina for me."

It is clear from the diaries, much of the content of which was not herein cited, that many systems did cover certain core topics, like career information and planning, by using such basic materials as, Career Opportunities (New York Life Insurance Company). The impression gathered from the study of the diaries was that the IV course was not taught exactly the same in any two school systems. In some the emphasis was heavily "guidance"; in others, "practical experience."

As already noted the IV course was administered in two different ways: Individual teacher approach and the team teacher approach. Examination of the diaries revealed that with respect to either course content or structure, there was no difference between the two approaches. Although IV materials could not always be correlated with science, mathematics and English, most team teachers preferred this method of administration to any type they have ever known. Group planning made them aware of the ideas held by their colleagues as well as the problems in teaching individual students. Hence, oriented to the plans of the other teachers, they could refer to the specific activities experienced by the students in other classes. With reference points established in the Science, English or Math courses, the IV teacher could in a meaningful way build upon the learnings of the students. For the student to recognize that he already knew something about a topic motivated him to learn more. For the teacher to recognize that he could provide the bricks and his teammates provide the mortar in one unified effort to build up student learnings was a major morale builder.

To get the flavor of the team approach, the reports of one team were selected. The intercorrelation among the courses should be noted, as well as its absence. The forthright teacher evaluations should be noted as well.

MATHEMATICS CORRELATION WITH INTRODUCTION TO VOCATIONS

November 22, 1963 to February 28, 1964.

Units Covered

In the last of November, a unit on percentage was introduced following directly the unit on fractions. The percentage formula was used and the difference between per cent and percentage emphasized. Rounding the results of a percentage followed by necessity. The problems on percentage were worked through the use of the percentage formula. The larger than 100 per cent study and smaller than one per cent or fractional rates lead to the changing of fractions to per cents. Problems on marked price, sale price, and net gave a practical application to the use of the percentage formula.

In January, with the posting of the examination schedule, we began review for examinations. Material covered from the first semester included units in integers, decimals, fractions and percentage.

Measure study was begun with a booklet publication from General Motors, "Precision." A brief history of measurement lead to our now standard units of measure and the metric system of linear measure. The detailed study included English and metric lengths, exact and approximate measures, changing of measurements within one system and from one system to another. With the beginning of linear measure, the perimeters of squares and rectangles were introduced and possible perimeter formulas for other plane figures discussed.

Surface area of squares and rectangles necessitated the memory of the table of square units in the English system. The surfaces of solid rectangles and squares were examined via wooden forms. The difference between the surface area and the volume of a rectangular solid has just been completed with the use of cubic measure. We are continuing the study of volume, area, and perimeter as applied to circles through circumferences and areas and will use cylinders to combine the study of both.

Methods Used

Because of the various academic levels of the students instructed, many different methods of presentation have been tried. Definite formulas for procedures were introduced wherever possible.

Methods of instructions have varied with the use of several mediums, one being the overhead projector for presenting new material. "The thing" was used as a chalk board but prepared negatives were more exact and therefore appeared to be more instructive. The diagrams of figures were constructed in unison, teacher at the board and pupils working individually, and were augmented by display of wooden models including rulers in English and metric measure. Oral drill by the entire class was followed by daily writing of tables of measure in form of a short test. Individual student explanation of applied problems at the chalk board gives students a rest from teacher performance.

A film strip, "Measurement" from the McGraw-Hill series was available and will be used at the conclusion of the unit as a summary.

The heuristic method of teaching was tried but seemed to be more stimulating toward diverting the subject than progressing. Daily testing as a means of instruction was requested by students.

Correlation with English outline was effective for review study. The study of the metric system in science helped make the teaching in mathematics easier. Measurement in manual and mechanical operations emphasized through problems assigned.

Results

"The progress with about 50 per cent of this group of students is very slow and seems almost impossible to speed up. More than one idea at a time is confusing and the work has to be developed very slowly and carefully. Simple mathematical vocabulary has to be taught from the standpoint of spelling and pronounciation before the use in basic fundamentals can be accomplished.

Assigned homework is of value to a few but most assignments must be partially prepared during class time with insistance from the teacher.

The following of instructions is improving but good study habits are difficult to instill. From previous experiences these students expect to be passed on poor performance and reason to themselves and the teacher that they manage to 'get by somehow.'

Teaching by use of the overhead projector seems to stimulate more exact learning but cannot be used too often as the attention span is very short requiring frequent shifts in mediums used."

ENGLISH CORRELATION TO INTRODUCTION TO VOCATIONS

"In teaching reading improvement to the entire class we have used mostly the lecture method in connection with the blackboard; this is especially true in the teaching of context reading, syllabication, and inference, while working with small groups who have the same difficulties in sound and word structure. We used the blackboard, discussion, question and answer method.

We worked on the Dolch list of basic words mostly by memorizing and context clue when context clue is possible. Since the Dolch list are basic sight words memorizing them is about the only way to learn them.

We used the lecture method with the use of the board to show examples and illustrate because attention is held better and the explaining of every detail is essential. The lecture method also causes the students to ask questions.

We used the board to illustrate the various kinds of letters which were discussed along with bringing to class examples of different kinds of business letters from local concerns.

We spent a great deal of time presenting and working on the letter of application because of the practicality of the letter. I worked individually with each student having the students repeat the letter until it was as near perfect as possible."

Books have been read on various occupations as well as those that relate to science and mathematics. Each student has completed at least four books that are correlated to the other subjects, one example is a biography of someone who has been successful in an occupation the student is interested in.

IVE SCIENCE

Since the last report the following units of study have been completed:

1. Petroleum
2. Heat and air conditioning
3. Weather and climate
4. The solar system

The petroleum study material was furnished by the American Petroleum Institute. The following activities were used in the study:

1. Class discussion
2. Teacher lecture
3. Demonstrations
4. Individual experiments
5. Individual and group reports

The individual and group reports were done to give the students a chance to show individual work and skill. The material was easily broken down for reports and the results seemed good. The students grew tired of the work before unit was completed, however.

In correlation, careers, manual and mechanical occupations, and economic aspects of the study were stressed for IVE. Also, I discussed the possibility of using science fair projects as a project for manual and mechanical occupations project. For mathematics, we worked together on percentages that were used in the petroleum material. Vocabulary words were given for English work. In total overview, the unit seemed to work well.

For the unit on Heat and Air Conditioning, I used lectures, class discussion, demonstrations, and individual experiments to teach the unit. Lectures, demonstrations, and experiments worked well I thought, and several very good class discussions proved their effectiveness.

Correlation for IVE classes was done through studies of Manual and Mechanical occupations in this field of study. For mathematics, we used several formulas which were taken up on math classes. Again, in English we had vocabulary words which were very important.

The unit on Weather and Climate was taught with some change. The following methods were used:

Lectures and class discussions
Demonstrations and experiments
Films
Booklet assignment
Daily weather study

These films were used:

"Unchained Goddess"
"Winds and Their Causes"
"The Geography of the Americas"

Each was used to explain the unit materials. The Geography film was used to show how various sections of the country differ because of differences in climate and weather.

The booklet assignment was made, so that the students could proceed at their own rate and level, and on their own particular interests. Most students did a good job on the booklets, I thought.

We also spent a week studying the daily weather conditions and observing the weather forecasts. This seemed to motivate many of the students and results were good.

In correlating, the economical aspects of the subject were stressed for IVE. In English, the booklet assignment made use of the library and general research procedures. For math, we again used formulas and general math procedures.

In the solar system unit, I used lectures, class discussions, demonstrations and experiments, films, and a booklet assignment to teach the unit.

The films used were:

"Energy from the Sun"
"Face of the Earth"
"Explorers of Outer Space"
"Our Mr. Sun"

These seemed to motivate the students as well as teach the material. Class lectures and demonstrations seemed to be very good, as students were interested in the subject.

Correlation was difficult, but for IVE we discussed several professional and technical occupations and the operation of calculators. Mathematics was used for general problem work, while English used vocabulary and research procedures again.

INTRODUCTION TO VOCATIONS

KINDS OF ACTIVITIES

I. Reading various materials in class. This was done to see that the students actually did the work, also to help the students with something that they might not understand.

This seemed to work very well some days but poorly on others. Sometimes it depended upon the material. Most all of the students seemed to like Understanding Our Economy: SRA; also they seemed to work well with Why Complete Your Education: Texas State Teachers College. They did not work well with North Carolina: An Economic Profile: Federal Reserve Bank of Richmond. Most of the boys did not like Careers in The Retail Automotive Business: General

Motors. These are some examples of reading material used. Other material will be mentioned later that was presented in this same manner. The reaction of the students varies with the material and with the students from time to time.

II. Group Discussion. The class was divided into small groups according to ability to discuss material previously read in class. The purpose of this activity was to enable the students to help each other and to relate personal experience to the subject discussed. This activity seemed to work very well. Some groups tried to "get off the subject" once in awhile, but this is to be expected with most any group.

III. Writing reports. Each group was expected to write and present a report of their work to the class. The purpose of this is to give a wide variety of activities (material) to the class. Students seem to work very well at this. Again, there are bad days for some unexplainable reason.

IV. Use of tape recorder. The purpose of this activity was to create interest and to let the student get an idea of how he speaks. The tape recorder seems to be an excellent tool to motivate the students. The main limitation is the time factor involved.

V. Library work. Several students were allowed to go to the library each period. The work in the library involved books concerning occupational information, and also books containing possible ideas of projects. All students liked library work.

VI. Films and Film Strips. Films were used to present basic information on occupational information, American Economic system, and some possible ideas for projects.

VII. Projects. The purpose of the projects was to give students something to do involving skill with their hands. It was also done to help them develop original thinking and ideas, and to develop self-confidence. They were asked to do an original project related to some manual and mechanical occupation. They were not allowed to spend a large sum of money. In some cases, two students were allowed to work together. Several of the girls have made dresses. Most boys seemed fascinated by the assembling of model cars. Several students were allowed to do projects of this type, but the idea seemed to "snowball," and there were possibly too many model cars. The original purpose of this (assembling of model cars) was to see how well the student can follow directions.

Almost 100 per cent of the students are very enthusiastic about the projects. No help was given by the teacher, only encouragement. More projects will be assigned in the future.

VIII. Use of speakers. Guidance Counsellor. Reaction very good. D. E. Co-ordinator. Most students very interested in taking D. E. in the future.

IX. Use of Chronicle Career File. This file was used by several students each day. The purpose of this activity was to allow the students to find specific information concerning a certain occupation. The students recorded various material from the file. The activity worked extremely well.

X. Lecture. This type of class was used very little; however, if a lecture was accompanied by the use of the overhead projector, the reaction was always very good. This method was used to present current events related to occupations, to introduce new material, such as an introduction to clerical, sales, and service occupations, and other material that is applicable. Most students took notes on the material presented for possible discussion later.

HOW FILMS WERE USED AND WHY

After the film was shown, students were required to write a brief resume' of the film. Students were then divided into groups for a short discussion of most films, and each group gave a short report to the class. Errors in reports were corrected by the teacher, and important points clarified. These discussion groups worked on some days, and sometimes they did not. These discussion groups were used in order to conduct the IV classes with a minimum of lecture. Also, it seems that students can learn from each other better than they can from a lecture method. The films were carefully chosen from various catalogs that are available and were previewed by the IV team in order to correlate if possible.

Listed below is each film, with an explanation for its use. They are not listed in the order that they were shown:

What Makes Us Tick. This film was used to help explain the American economic system. It is a cartoon, and is an excellent film.

Working Dollars. This film was also used to help explain the American economic system. It is also a cartoon and an excellent film.

High School: Your Challenge. With the realization that some ninth graders seem to resent being constantly told to "stay in school," this film was shown to stress the importance of getting a high school education. It is an excellent film, but the effectiveness cannot be measured.

How To Investigate Vocations. This film was shown with several things in mind: 1. To show the students a systematic way of investigating an occupation, 2. To create interest in the occupational literature available, 3. To serve as a medium to get students interested in the library.

The Truck Driver. Many of the boys are interested in driving a truck as a career. The film was used to, 1. Present some aspects of a truck driver's working day, 2. To illustrate a manual and mechanical type of occupation.

Do-It-Yourself Aluminum. Each student or a group of students were assigned a project that involved working with their hands. The film was used to illustrate several projects that could be made from aluminum. The film presented many good ideas, but the students seemed to think that the material was too expensive.

What Greater Challenge. This film was used to show some of the job opportunities associated with the newspaper industry.

Teamwork in Transit. A film concerning the transportation industry--illustrating several occupations in the transportation industry, but did not mention the occupation as such. The film was not suited for the purpose intended by the teacher.

The Big Question. An excellent film with Dr. Frank Baxter as narrator; it tells about the importance of choosing a career. The purpose of the film was to acquaint students with the fact that they can make inventors of themselves, and that each person is an individual. Also, the film was used to point out to the students that certain tests have great value in determining various strengths and weaknesses of an individual. It is an excellent film, and it served the intended purpose well.

Navy Frogman. Several of the boys had expressed interest in this type of occupation. The film was shown to, 1. Create more interest of the students in the course and, 2. To show some of the aspects of this type of occupation. The film served the purpose well for the boys, but seemed of little interest to the girls other than entertainment.

CORRELATION (With IVE)

Correlation of math, science, and English was tried whenever appropriate. If possible, the subjects are correlated on the same day. This was almost impossible to accomplish if any continuity takes place in the math, science, and English classes. Correlation seems to help create interest even if it occurs much later. Also, if a teacher just mentions what is taking place in another class, this seems to help the students do better in all classes.

Some specific examples are these:

1. Formulas in science, same in math
2. Population of N. C. & U. S. in IV, same in math
3. Vocabulary words from all subjects to English teacher periodically
4. Supplement a reading material to English teacher
5. Career booklets in IV (Oil), science classes using material concerning petroleum, percentage studied in math concerning crude oil yield, vocational words discussed in English.

Because a novel program has few external criteria which may be used to evaluate it accurately, teachers were frequently seeking feedback from the students and parents. Most of the techniques were informal. Few students, parents, and interested citizens were unimpressed with the program. The workers whom the students interviewed, the business executives who came to lecture, the school principals who had to locate funds for materials, and the students who were introduced to the serious problems of employment as well as to the confrontation of the gaps between their vocational interests, aptitudes and life goals were all deeply affected by the course. Nor was the course uncritically accepted either. Shortcomings were observed. Teachers, moreover, were quick to acknowledge them and to try new avenues of approach.

Some attempts to obtain feedback were more formal. Reproduced below is the evaluation which one student made of the course she was receiving. The approaching career realism is worthy of note. Here is in her own words, the student's perception of the IV course.

I have learned a lot about the world of work this year. First of all, I have learned what an employer looks for when he hires someone. I think that this is very important because now I will not be as naive when I apply for my first job.

Also, an important thing I think we have learned this year is about high school key studies. I am very glad that was included on the outline that we study jobs from. From this we can sort of plan our different subjects we take to match as many different fields as possible.

When we studied about dead end jobs, I think everyone benefitted from it. Now we won't plan our future around one job and then when the time comes to go into this field, after we have had all of our education, it won't be there anymore.

Another attempt at evaluation is presented below. The frequencies are based on responses of 40 students selected at random.

1. Strongly agree 2. Agree 3. Undecided or uncertain 4. Disagree
5. Strongly disagree

AN INVENTORY OF ATTITUDES OR OPINIONS ABOUT THE COURSE, IVE

Directions: After reading the item carefully, please indicate your response by encircling the number which most nearly represents your reaction to the topic in question.

Ratings 1, 2, 3, 4, 5	
16, 16, 5, 2, 1	The justification for a vocational education course at the early high school level is associated with the needs of this age group.
13, 17, 5, 4, 0	Youth at the early high school age lack first hand knowledge of the world of work.
12, 21, 5, 1, 1	Youth need opportunities to appraise their emerging potentials.
15, 11, 4, 8, 0	Ninth grade students lack confidence in making decisions about future education and occupations.
21, 8, 8, 3, 0	The decisions students make at the ninth grade level influence greatly their eventual vocational careers by limiting or increasing their future educational and thus vocational choices.

Ratings 1, 2, 3, 4, 5	
22, 12, 3, 0, 2	The course, Introduction to Vocational Education provides students with the opportunity to become better acquainted with themselves.
19, 13, 3, 2, 2,	The study of occupations is as important to me as any other subject matter.
23, 11, 1, 1, 3	In consideration of six months experience in IVE I would rather be in the IVE class than in a study.
14, 19, 6, 0, 0	Eighth grade students should elect IVE.
21, 11, 5, 1, 0	Every student should consider it an advantage and a privilege to take IVE.

In another system, students evaluated the course using a slightly different instrument. Below are their replies:

STUDENT EVALUATION

	Well	Fair	Poor
1. Do you feel that the primary objective, (the student to explore his interest and "World of Work") is being met?	60	22	2
2. Do you feel that you have been introduced to career opportunities which you had never before known or considered?	58	24	3
3. Taking into consideration that this is the first year--a testing program with no text--do you feel your instructor has had a well-planned program?	77	14	0
4. Were your speakers, who were called in on various topics, of value and interest?	60	28	3
5. Were field trips interesting and of educational value?	61	25	0
6. Do you feel that the student-business interviews helped you to become better acquainted with the "World of Work" and you have become more confident in meeting the public?	52	25	6
7. Has your instructor made an effort to supply you with adequate research materials?	86	6	0
8. Has she supplied sufficient mimeographed materials to supplement for the text?	84	4	0
9. Is she well acquainted with various occupational fields?	71	10	1
10. Do you feel that this course has been about as valuable to you as any other course that you are taking at this time?	66	12	5

The parents of students also evaluated the course. Students, it may be noted were more critical of the course. Both parents and students may be said to have endorsed the course.

PARENT EVALUATION

	Well	Fair	Poor
1. From what you have learned through your child and the teacher, do you feel that your child has benefitted by taking this course	41	15	0
2. Does your child seem enthusiastic about the course?	39	11	0
3. Do you feel that special speakers, field trips, research done by students, film, etc., are of educational value to your child?	51	3	0
4. Do you feel that the instructor has sufficient background, education, and training to teach this course?	49	4	0
5. Is the instructor interested in the individual student and willing to give extra time with him or her?	53	1	0
6. Is the teacher enthusiastic and interested in making the course worthwhile and interesting?	54	0	0
7. Does the teacher have a pleasant and understanding attitude?	51	3	0
8. Has the instructor made effort to obtain sufficient teaching aids and research materials (considering this is the first year with no text) to cover the objectives?	54	1	0
9. Do you feel that the work involved in this course and values obtained warrent One-Unit Credit, the same as other courses?	54	1	0
Answer quote from one paper: "I feel that this course will help the student choose the vocation which he is most talented and as a guide to help him train for the work that he is best qualified to do." M. H.			
10. Would you recommend Introduction to Vocations to remain in the curriculum for ninth grade students? Why?	YES		NO
	55		0
Answer by one parent: "This course guides the student in choosing the subjects he will need to prepare him for his work."			

SUMMARY

Teachers varied considerably in their approaches to the IV content. Time spent on vocational and economic topics varied also. Team teachers enjoyed group

planning. Few differences in IV programs could be observed, however, between team or individual teacher approach. The actual plans of one teacher is presented to demonstrate attempts at correlation. Many teachers made their own evaluatory studies. Examples are included.

THE IV PROGRAM: EVIDENCE FROM CLASSROOM OBSERVATION

The IV course is an innovation in education in North Carolina. Because of its uniqueness, criteria to evaluate it are not easy to construct. Culled from the research literature were several questions whose answers, though descriptive rather than evaluative, would give the research team some inkling of how people are responding to this innovation.

Twenty IV teachers were visited one or more times during the school year. In appendices C and D are the schedules used to study student and teacher response to the program.

Grouping for instruction was the first item of interest. No uniform practice in assigning students to the class could be observed. In some schools, students volunteered to take the course; in others, students were involuntarily assigned to the class. In one school system, the students were drawn from the upper half of the ability distribution. In other schools, only the low ability students took the course. A cross section of ability, in still other schools, was represented in the class.

The classroom atmosphere, it is widely held, contributes to learning, if only indirectly through motivation. In but three classes was there evidence of student displays. A particularly informative display was a map of the community designating streets, homes, and nature of employment of the head of the household. From this display emerged a second one in which a frequency distribution of the occupations of the (Caucasian) citizens of the town appeared.

Some classes had no displays at all. In the majority of classes, the displays were developed by the teacher. Regrettably, they were so colorless and so unorganized that students rarely looked at them. In striking contrast, was a poignant display entitled "Take a hard look at yourself." Two adolescents are looking into adjacent mirrors. They are asking themselves what kind of jobs are they seeking, what training will they need, what are their interests, what are their hobbies.

Many classes had some supplementary reading materials, but on the days visited they were not used. Reference files of occupational information were available in

most schools. Similar information on economic systems was lacking. Rarely was there information on personality data. Most schools had visual aids equipment available to them. Often, during the team's visits, the teachers were using the equipment in instructing the class.

Although some students were unenthusiastic about the class, judging by the number of questions students asked as well as by other forms of participation, the observers inferred that most students were motivated to learn. Rarely, however, were students encouraged to take notes. As a result, students quickly forgot what they had heard but a day before. This could be observed during review classes. At the other extreme were students who recorded every comment made by the teacher or reporting students. When the teacher asked questions about the lecture delivered, without skimming their notes, the students were unable to reply. The essence of the course is lost when the relevant ideas are not recorded or are recorded in language alien and, hence, meaningless to the students.

A few teachers encouraged students to synthesize, generalize and compare the information. These are important procedures in that they help "clinch" points and to prevent confusion between the highly similar types of information, especially with regard to requirements, employment needs, and attributes of those in the several types of careers, farming, sales, clerical, mechanics, professional and technical. The large majority of teachers had no summing up period. Equally important is the relating of acquired information to real life experience. Although most classes were quite bookish, a few teachers specified real life references about several kinds of career information. For example, the local pay rate and fringe benefits for clerical workers differed quite markedly from textbook figures. Also, teachers effectively exploited student backgrounds in, say agriculture or auto mechanics, to make certain points about training, work values, and future job openings.

Conferences with teachers yielded information unobtainable by any other technique. The enthusiasm of the teachers for the course was intense. This, despite the unending and frequently unrewarding search for materials. Hampering instruction was the lack of books and supplementary reading material as well as the lack of funds to purchase materials. Where the teacher correlated classroom lecture with shop experiences, the deficiency of equipment was a major deterrent to instruction.

Some teachers felt they were incompetent to correlate the verbal part of the program with the action part. Others felt that such a correlation was vital and

necessary but were not permitted by the industrial arts teacher to use the necessary equipment. A considerable motiviational advantage accrued to those students whose teacher provided them with a balanced program.

Attitudes about what a student should or should not study were observed, the curriculum in Negro schools included much Negro-centered materials; the curriculum in Caucasian schools included much Caucasion-centered materials. While the realism of this approach cannot be established, it is surmised by the writer that the members of the several racial groups are being denied information about the total economic picture especially with regard to employment. Attitudes toward sex related career opportunities were such as to give girls opportunities to study job markets for girls and to give boys opportunities to study job markets for boys. In some schools, girls learned little about carpentry and auto mechanics; boys, about nursing and clerical careers. Yet, if boys and girls are to comprehend vocations and how they are interrelated as well as how group beliefs about careers influence the labor market, wider coverage of all careers is to be given, irrespective of traditional attitudes about sex roles in employment. The labor market, moreover, is changing. Rapidly disappearing is the sharp difference between the kinds of careers males and females enter. The IV course, to reflect faithfully this employment trend, should concern itself with information and experiences without regard to sex. To place this information in perspective, however, the effects of racial, religious, and sexual attitudes on employment should not be neglected.

SUMMARY

The research team observed many classes actively engaged in learning. In some, students took no notes; in others students copied much irrelevant information. Displays were not always eye catching. Restricting information about racial and sexual factors associated with employment prevented grasp of concepts dealing with the total American economy.

THE IV PROGRAM: EVIDENCE FROM QUESTIONNAIRES

Armed with the tentative draft of the course outline developed by Dr. Beam, the IV teachers tackled the difficult assignment of fashioning a course with but a minimum of guidance. This task required considerable resourcefulness. Although the teachers, quite independent of one another, developed similar instructional plans, the IV programs throughout the State, it has already been established were generally not alike.

The cornerstone of any course, it is believed by many educators, is the textbook. It was here that the teachers were hampered. No textbook was available which covered the wide variety of course topics. Some literature dealt with occupations; others, with basic principles of economics; still others, with self appraisal. To relate awareness of self, especially interests, abilities, and goals, with job requirements and job opportunities was the enormous task which the teacher had to undertake without the aid of the basic textbook. While some books and pamphlets were available which covered certain topics, in but a few school systems were they available in the quantity necessary for distribution to the entire class.

The most frequently used materials were Occupational Outlook Handbook, U. S. Department of Labor, Bureau of Labor Statistics, G. P. O., Washington, D. C.; New York Life Insurance Company: Career Opportunities; North Carolina: An Economic Profile. To illustrate how differently each teacher handled the topics of economics, North Carolina: An Economic Profile in one class was discussed for one week; in another, for four weeks; in a third for six weeks. Other references were used by the teachers. In the selected references below, the starred items were reported by one or more IV teachers to have merit.

Often, pictorial representation is far more effective in teaching than is the lecture or discussion methods. The student is able to journey to a variety of careers without leaving his seat in the classroom. Most of the teachers used films and supplemented them with discussion. Not only does effective use of films hinge upon frequent immediate reference to what has been viewed, but it also depends upon orienting the students to what they are expected to see. Reference weeks later to selected scenes of a film prevents the all too easy forgetting of the film.

The films judged effective by the teachers are listed below:

Film	Company	Topic
You are not alone	Association Films	Help is available
Distributive Education	Association Films	
The Big Question	Association Films	Aptitude test and Individual Differences
What makes us tick	N. Y. Stock Exchange	Basic Principles of Economics

Books, as important as they are, only substitute for real life experience. The full impact of a career can be appreciated only when observed in action. IV teachers provided a wide variety of field trip experiences for their students. Among the places visited were food processing plants, industrial education centers, radio and TV stations, lumber yards, restaurants, food markets, public utilities, machinery distributors, dairies, textile mills, tobacco processing plants, banks, marine laboratories, fish hatchery, trade fairs, and such government operations as Employment Security and Social Security Administrations.

Some teachers took their students to several places exemplifying the same type of operations, e.g., marine laboratory, others utilized the field trips to demonstrate different types of operations. One teacher said that he would have taken his students on more trips had there not been an administrative prohibition against more than three trips per year.

Visiting speakers gave life and substance to the course. They stepped out of life to prove what the textbook was saying in many more words. Among the addresses given were those dealing with industrial education centers, manual and mechanical occupations, future employment picture, the effect of high school and college diplomas on job attainment, meaning of test scores, how business is operated, armed forces careers, wildlife careers, the building trades, and machinist trades.

In most instances, the speakers were dynamic and communicated with the students. Demonstrations and use of visual aids maintained student attention. Occasionally, speakers failed to win the students. In choosing a speaker, it should be determined whether a field trip, film, or book might as effectively teach the topic. The

merit of the speaker who carries on a demonstration is to animate the subject matter, especially for topics such as economics and testing where motivation and understanding are inadequate.

The teachers were asked to evaluate the several aspects of the program. There was little agreement among them. The table below is based on the replies of eight teachers. Students reports, films, field trips, speakers, job survey, and self study were considered to be the greatest aids in achieving the objectives of the course.

Table 1

Teacher Judgment of Aspects of the Course

Aspect	Very Little	Much	Immense
Lecture	4	4	0
Student reports	0	6	2
Films	0	6	1
Field trips	1	4	3
Speakers	1	6	1
Group projects	3	3	1
Shop work	4	0	3
Community survey	1	6	1
Job survey	0	7	1
Self study	1	3	2
Student diary	1	3	0
Correlation with subject matter	1	3	1

When asked which phases of the course should be deleted, there again was no unanymity. The most frequent reply was "no phase," one teacher recommended the omission of field trips, another of the shop phase. Although unrelated to the question, several teachers cited their need for reference materials.

Asked of the teachers also was what they thought should be taught in succeeding IV courses that was not already covered. Among the comments made were, "basic shop work to make simple projects related to an occupation," "greater emphasis on self study," "more guidance materials" "shop for boy; homemaking for girls" "a unit on speech" "visits from representatives of Employment Security." The teachers considered themselves ill prepared to explain test scores to students. Not only did they feel it their responsibility to tell them what the scores denoted, but students wished to know what scores connoted. Finally, the gains in self confidence resulting from interviewing and being interviewed were underscored by several teachers as areas requiring inclusion in the program.

Since the teachers knew their students very well they were asked what programs should be made available next year for this year's students. Many could not comment. The few teachers who did respond to the item believed the program should be diversified and students should be encouraged to pursue an area of vocational interest in the curriculum, e.g., building trades, machinists.

SUMMARY

Few books were available to all students in IV classes. Textbooks in this area are generally limited; others covering selected topics, though available commercially were not distributed to students. No two classes were shown the same films. Field trips permitted students to visit a wide variety of industries and to observe careers in action. Visiting speakers made the study of vocations interesting and real to the students. The teachers felt that each of these approaches enhanced the program.

RESULTS OF PROGRAM

Reliability

The observed or obtained score on any test is only an estimate of the true measurement of behavior. Minor changes in scores is to be expected due to chance. The size of the fluctuation of standardized test scores may be determined by multiplying the standard deviation by the square root of one minus the reliability coefficient. The resulting statistic, the standard error of measurement designates how much chance fluctuation to expect in 67 out of 100 retests.

In the technical report for the Multiple Aptitude Tests, the standard errors of measurement for ninth grade students in raw score units are 3.5 for word meaning; 3.4 for paragraph meaning; 2.2 for arithmetic reasoning; 2.5 for arithmetic computation; 3.7 for applied science and mechanics; 2.2 for spatial relations -2 dimensions; and 2.3 for spatial relations -3 dimensions.

The manual of the Picture Interest Inventory, indicates that for eighth graders, the standard errors of measurement for fields of interest are 2.1 for interpersonal service, 4.2 for natural, 2.5 for mechanical, 4.3 for business, 3.1 for esthetic, 2.8 for scientific and for the supplemental scales are 2.1 for verbal, 2.2 for computational and 1.6 for time perspective.

The consistency of the informal tests are presented here. For the Business Information Survey (BIS), interscorer agreement was 100 per cent; two scorers had independently scored 150 protocols with the objective key. The agreement covered all items; earnings, number of people now in careers, future job openings, mental ability requirements and prestige. A second indication of reliability was with regard to stability in responding. Ninety-two teachers enrolled in the Introduction to Vocations Training course were tested with the BIS twice within a period of eight days. Replies are in rank form. These ranks were compared with objective and subjective criteria also in rank form. The rank order correlations were converted into one of five categories, ranging from 1. high agreement to 5. high disagreement. The Pearson product moment correlation was not used to assess reliability here because it seriously underestimates the coefficient when the range of scores is limited. Instead the percentage of agreement over the period of a week was determined. In table 1 are these percentages. For many scores, test-retest changes were slight. To be sure there is fluctuation over a period of a week. To this extent interpretations are limited.

Table 1

Stability of Responses: Percentages

Scores/test-retest	Identical	Different by one category	Different by more than one category
Objective			
Earnings	71	29	0
Number employed	55	37	8
Openings	41	43	14
Ability requirements	59	30	11
Prestige	61	24	15
Subjective			
Earnings	63	29	8
Number employed	39	37	24
Openings	44	37	19
Ability requirements	60	27	13
Prestige	63	28	9

Additional statistics presented in Table 2 below not only confirms the already observed tendency toward stability but also the mean values indicate the degree of agreement with the keys. Most scores indicate that the teachers agreed with the objective key. Only for number employed was this not observed.

Table 2

Test-retest Means and Standard Deviations

	Test -1		Test -2	
	Mean	S. D.	Mean	S. D.
Objective				
Earnings	1.256	0.540	1.268	0.545
Number employed	2.829	0.699	2.780	0.770
Openings	1.866	0.899	1.707	0.793
Ability	1.280	0.672	1.524	0.707
Prestige	1.354	0.655	1.927	0.858
Subjective				
Earnings	1.549	0.891	1.329	0.610
Number employed	3.707	1.149	3.780	1.144
Openings	2.256	1.120	1.890	0.981
Ability	1.585	0.993	1.292	0.676
Prestige	1.415	0.736	1.341	0.613

Inter-scorer agreement on My Career was fair to substantial, depending on the item. Agreement among two scorers for 100 protocols selected at random was 88 per cent for classification of career, technician and operatives careers were juxtaposed most often; 88 per cent for degree of differentiation of reasons for selecting a career; 80 per cent for content of responses, scorers differed in scoring of "correlates"; 74 per cent for specificity of educational requirements; 90 per cent for relevance of requirements; 94 per cent for classification of traits; 66 per cent for joys anticipated; 91 per cent for dangers; 84 per cent for degree of differentiation of dangers; 100 per cent for plans discussions; 100 per cent for pre-vocational activities undertaken; and 92 per cent for scoring of alternative choices.

The split half reliability of the achievement test for 200 students selected at random was +.60, which when corrected becomes +.75. This suggests that the two halves are not identical, although they do bear strong similarities to one another.

In summary, no test was completely unreliable. Their reliabilities are sufficiently established to meet minimal reliability requirements for research. The fluctuations in scores due to chance factors and due to imperfections in all instruments used will limit interpretation of the findings.

Validity

For grade nine samples, the word meaning test of the MAT correlates +.75 for boys and +.85 for girls and the paragraph meaning test correlated +.82 for boys and +.80 for girls with the ACE Psychological examination - L Score. DAT - numerical ability correlates +.82 for boys and +.62 for girls, with MAT arithmetic reasoning and +.72 for boys and +.54 for girls with MAT arithmetic computation. For boys, the applied science and mechanics correlates +.51 with DAT abstract reasoning; for girls the correlation is +.63. For boys, spatial relations - two dimensions correlates +.59 with Guilford Zimmerman - Spatial Visualization; for girls, it is +.34. Finally, for boys spatial relations - three dimensions, DAT - abstract reasoning correlates +.43; for girls, it is +.46.

One set of validity coefficients for the Picture Interest Inventory was determined on the basis of 418 junior high school students who also took the Occupational Interest Inventory, Intermediate. Correlations are moderately high. Interpersonal vs personal social was +.56, natural vs natural, +.77; mechanical vs mechanical, +.69; business vs business, +.71; esthetic vs the arts, +.61; scientific vs the science, +.67; verbal vs verbal, +.70; and computational vs computational, +.59.

The content of the Business Information Survey and My Career appear to measure what they purport to measure. Because both instruments were used for the first time, no type of validity check could be made. The instruments are, therefore, limited.

Likewise, the achievement test had no prior validity. Its content was culled from the various curricular plans of IV teachers. An analysis of the difficulty of each item was made. Two hundred answer sheets were selected at random. Items which were answered correctly by 70 per cent or more students were considered easy; items which were of moderate difficulty were those to which 36 to 69 per cent responded correctly; very difficult items were those to which 35 per cent or fewer correctly responded. Thirty-one items were judged easy; 32, of moderate difficulty; and six, very difficult. Percentages for each item appear in Appendix F.

COMPOSITION OF CLASSES

At the very early stages of the experiment both experimental and control groups were given the Multiple Aptitude Test and the Picture Interest Inventory. Comparisons of subtest scores in Table 3 reveal that for most attributes considered, there were few differences between the groups which could not be explained as sampling variability. In contrast to the control group, the experimental group was initially higher in arithmetic computation, spatial relations - three dimensions, and in interest in occupations involving interpersonal relationships.

Sketches of the Pretest Percentiles for the MAT and PII are presented in Figures 1 and 2. The sketches reveal the marked similarity between the two groups. At the 50th percentile a reference line is drawn to permit comparisons with the national ninth grade standardization groups. The few statistically significant results were not considered sufficient to permit the conclusion that the experimental and control groups were different.

*Significant at P.05 level

**Significant at P.01 level

After having participated in the IV course for seven months, both experimental and control groups were retested. In Table 4 are the retest scores. Statistical tests were made to determine if the changes in scores could have taken place by chance. The formula used was:

$$t = \frac{M_1 - M_2}{\sqrt{s_1^2 + s_2^2 - 2r_{12}s_1s_2}}$$

where M_1 is the pretest mean

M_2 is the posttest mean

s_1^2 is the pretest variance

s_2^2 is the posttest variance

r_{12} is the correlation between pre and posttest.

Although the t ratios are not presented here, it was observed that the changes in all aptitude and interest variables could be attributed to chance. Twenty-six of the 32 change scores reflected the regression toward the mean phenomenon, that is upon retest due to error of measurement high scores tend to go down and low scores, to go up. The hypotheses that aptitudes and interests become more intense as a result of the course were found untenable.

To determine the denominator of the t ratio, it is necessary to compute the test - retest reliability coefficients. Arising out of this procedure were several observations. In the first place, test - retest reliability coefficients were low. Low reliability coefficients could obscure differences that might have appeared as a function of the IV instruction. Of far greater significance is that reliability coefficients of the experimental and control groups differ significantly. Nine out of 16 tests of the differences between correlations were found to be significant. Eight of the nine revealed the scores of the control group to be considerably more reliable than those of the experimental group. What this indicates is that the control group change little but the students in the IV group change considerably over the experimental period. Note should be made of the correlations in Table 5. The differences in correlations between the experimental and control group are highly significant especially for the interest variables. Whereas, the test - retest coefficients for the control group are .77, .75, .65, .73, .59, .60, and .61 for mechanical, business, esthetic, scientific, verbal, computational, and time perspective respectively, for the experimental group they are .56, .55, .36, .60, .49, .23, and .34. It is clear from these data that as a group, interests or aptitudes change little beyond chance. Individual changes, on the other hand are considerable. Vocational interests of individual members of the experimental group were observed to change dramatically.

*Sig. dif. P.05

The end of Year Achievement Test

The split half reliability of the test has already been discussed. Some of the responses to the difficult items resulted in part from student misunderstanding of the question. For example, a person interested in using tools should probably become a forest ranger. Probably arguing backwards, the student thought that a Forest Ranger has tools, the students said "True." It must be conceded, however, that the main interests of Forest Rangers are not concerned with tools. Most students letting their consciences guide them unrealistically said "false" to the question, "A good worker will find nothing boring in his job." There is hardly a job in the labor market, the honest worker will have to admit, which does not have

some monotonous aspect. Time and wage concepts of apprenticeships were incorrect. Concepts of the duties of secretaries, moreover, were quite limited. House carpenter, moreover, was not differentiated from finish carpenter. Only 28 per cent of the students knew that Civil Service lists are determined on the basis of achievement on tests and appointment to a position was on the basis of merit and not by political influence. Productivity was confused with thoroughness by many. Finally, clerical ability could be differentiated from clerical interest by only 24 per cent of the sample.

The students knew much about developing job interests by performing manipulations akin to those done on the job, the relative instability of interests over the childhood to adulthood years, the role of hobbies in contributing to mental health, the role of work study programs in reducing dropouts, the role of aptitude and achievement in gaining admittance into college, government licensing procedures, the role of the Federal Government in teaching trades, and the large number of openings for operators, workman's compensation, and awareness of personnel departments worthy of note was that 74 per cent of the sample realized that during one's lifetime, retraining will be necessary several times. Additional percentages appear in Appendix F.

The average achievement test score was 43.93. The standard deviation was 6.26. To test the hypothesis that team teaching results in higher achievement than the individual plan, 280 students were selected at random from five randomly selected team and five randomly selected individual plan schools. The mean score for the team approach was 41.00, for the individual approach was 42.60. Since there were no differences between the means, the hypothesis that the team approach results in better achievement in the course was found untenable. The direction of the differences is opposite to that hypothesized.

It was observed that the schools in the sample varied in size. Some schools had fewer than 500 students; others had more than a thousand. The average score of 133 students from small schools was 42.23, from larger schools 41.38. The differences, here, too, were non-significant.

On the assumption that good students are good readers, it would be predicted that the good readers would make the highest scores. Since programming for the computer is no more difficult for determining correlation for two variables as it is for 16, not only was reading comprehension studied but all pretest scores were correlated with the achievement test. These data appear in Table 5.
Contrary to belief, reading ability was not related to achievement in IV. Nor were

any aptitude test scores. Rather some moderate, but significant correlations were observed between achievement and interests: mechanical, business, esthetic, scientific, verbal and time perspective. Interests in occupations are decidedly related to achievement in the course.

In addition to true-false items, students were allowed to choose one of two essay questions to answer. The first question was:

Assume you are applying for a job with the ACE Cleaning Company. Their ad reads like this. WANTED. Two sales clerks, one male and one female. Forty hour week, two week vacation with pay. Qualification: Skill in mental arithmetic. Write ACE CLEANING, c/o HJ 431, Anytown, N. C.

Write a letter of introduction to the company.

A random sample of 100 replies was examined. Fifty-five per cent of the students used the correct business letter format. This means that almost half of the students could not write business letters correctly. In the letter itself, contents varied considerably. Forty-three students listed previous schooling; 39, mathematics ability; 37, age; 36, sex; 23, votk experience; 23, meeting of requirements; 22, references; 10, height; 10, willingness to work; and 5, marital status. The remainder of the responses were made by one or two students. Requests for interviews, moreover, were made by 26 students. Although many students wrote acceptable replies to the advertisement, more training is needed. Reproduced below are examples of two extremes of letter writing, minor changes have been made to protect the writers.

ACE Cleaning
c/o HJ 431
Anytown, North Carolina

Dear Sirs:

I read your ad in the May 7, 1964, Dailey Advance. Which readed like this WANTED. Two sale clerks, one male and one female. 40 hr. week, two week vacation with pay.

Please consider me an applicant for this position.

I am 24 years of age. Weighs 120 pounds, hieght "5 '4. A high school grauduate of the D. F. Walker High School. I have had Business Education a course in I. V. E. and 4 years of college. Health excellent. A female.

For reference you may consult the D. F. Walker High School, North Oakum Street, Edenton N. C.

I maybe reached at the above address or call 480-6132. Any time between 6. am an 9:pm.

Thank you

(Miss.) Berta M.

Ace Cleaning Company
c/o HJ 431
Anytown, N. C.

Route 5 Box 1CS
Homeville, N. C.
May 7, 1964

Dear sir:

This morning I read abott your article in the paper, and I need a job. I am a High School graduate and I wish to get a job. I can do most of anything as long as it's work.

Your's turely

Douglas P

A second question dealt with the relationships of education, ability, and interests to professional preparation and income. Specifically, the question was: If you were a counselor in an employment agency. Someone wanted to leave school before graduation to enter the textile industry so that he might make enough money to finance his medical education. What would you tell him about the economic outlook for the dropout, the textile worker, the doctor? What would you want him to find out about his abilities and interests in order to guide him into the career most suitable for him?

A random sample of 100 responses was examined. Four aspects to the replies were noted. First, with regard to the dropout, he would be told by 37 that there would be poor job opportunities; by 21 that the economic outlook would be poor; by 13 that salaries would be very low, too low to finance a medical education. There were scattered single responses. Next, with regard to textile workers, 8 could tell him one needs a good education to get a good job; 6 would cite automation usurping jobs; 5 would mention little advancement. Next, with regard to the doctor, 9 cited he would have a bright future; 6, doctors are in demand; and 7, remuneration is good. Finally, the advice given the fictitious client was - stay in school - 63; analyze self through tests - 21; high school education should be completed before thinking about medical school - 23; get a job after high school diploma is received - 16. These replies reflect the growing awareness by students themselves of the need to know their own abilities as well as the importance of staying in school.

This may be seen in the following examples of replies by the students. The grasp of the problem by the first student is greater than of the second.

Number 1 -

If I were a counelor in an employment agency I would advise against droping out of school. I would tell him in the textile field of work you had to have a high education. If he really wanted to be a doctor I would advise him to take tests to test ability and interest of to see if he qualified to be a doctor. If he didn't qualify I would try to help to find a career that he had ability to do.

I would tell him to stay in school and tell him about the plan that government has set up for young when he or she dosen't have money to go to school so he could look into it and stay in high school.

Number 2 -

go back to High School and get a education. Because you do not have enough education to run the new job.

In summary, the achievement tests revealed areas in which the IV students were well prepared as well as areas needing improvement. Lack of differentiation between ability and interest should not go unnoticed. The fact that some IV students are growing in depth and maturity of outlook on the preparation for vocations is encouraging. There are remaining, however, a large percentage of students who also had the course who had only a superficial outlook on vocational education.

Some Characteristics of the Students

Questions about factors related to the career choices are in order. What are the aptitudes and interests of the students selecting certain careers. To answer these questions 236 experimental and 236 control students were selected at random. Analyses of variance of the pretest scores revealed that these groups did not differ significantly initially on any of the attributes but interest in science. Both experimental and control groups were combined. Analyses of variance of the scores on aptitudes and interests were made in order to study relationships with different career choices. In Table 6 it may be observed that students selecting the several types of careers differed in aptitude. The F ratio reveals the size of the departure from chance. The means reveal the central tendency of the scores.

A common belief is that brighter students tend to prepare for the professions. While there is research to confirm this observation, general intelligence is insufficient to explain plans for most vocational endeavors. Specific aptitudes, often, are better predictors. While paragraph meaning and spatial relations - two dimensions may be important in some careers, word meaning may be more important in others. The relevance of these observations to ninth graders who, through trial and error select a calling, is quite another matter. The vocabulary scores of

Table 6

Mean Multiple Aptitude T Scores and Career Choice

Career	N	Word Meaning	Paragraph Meaning	Arith. Reas.	Arith. Compu.	Appl. Science	Spatial 2D	Spatial 3D
Clerk	54	61.5	38.4	34.2	61.7	58.1	37.2	63.4
Farm owner	21	49.5	56.7	45.2	45.0	47.2	47.3	44.0
Laborer	28	57.6	48.6	43.6	53.0	49.7	38.9	53.4
Merchant	9	55.8	45.1	41.7	54.9	52.2	46.9	56.1

Professional	224	60.0	42.0	38.4	56.2	54.4	44.6	58.3
Technician	70	50.1	48.6	52.5	50.5	51.9	48.4	47.4
F ratio		13.6*	15.8*	21.6*	13.8*	5.0*	7.6*	18.3*

*Significant beyond the one per cent level of probability with 6df in numerator and 464 in denominator.

those students selecting professional and clerical careers were among the highest of all career types. Yet the career group receiving the highest reading comprehension scores was the "farm owner." "Clerk and "professional" received the lowest scores. The "technician" group received the highest arithmetic reasoning scores; again the "clerical" and "professional" groups received the lowest. With respect to arithmetic computation, the "clerical" and "professional" groups received the highest scores and the "farm owner" group the lowest. Applied science and mechanics scores were highest for the "clerical" group, next were "professional" and "operator" careers and lowest was the "farm owner." All career groups were below average on spatial relations - two dimensions. On this subtest, the highest scores were made by the "technician" and "farm owner" groups, the lowest by the "clerk" group. Finally, with regard to spatial relations in three dimensions, most groups were above average. The "clerk" group received the highest scores and the "farm owner," the lowest.

A T score of 50 is the fiftieth percentile. Scores higher than 50 would then be above average; lower, below average. Viewing the data in another way, those students choosing "clerk and sales" careers were above average in word meaning, arithmetic computation, applied science and mechanics and spatial relations - three dimensions but below average in paragraph meaning, arithmetic reasoning, and spatial relations - two dimensions. The farm owner group was below average on all aptitudes but paragraph meaning. The laborer group was above average for word meaning,

arithmetic computation, and spatial relations - three dimensions and below average on the other aptitudes. The merchant group contained but nine members, an interesting finding in and of itself. This group was above average in word meaning, arithmetic computation, applied science and mechanics and spatial relations - three dimensions. The operator group was above average in word meaning, arithmetic computation, applied science and spatial relationships - three dimensions. The professional group with somewhat higher scores than the operator group excelled in the same attributes observed for this group. Finally the technician group received scores very near the average on all attributes. Word meaning, arithmetic reasoning, arithmetic computation, and applied science were slightly above average.

It is clear that choices of careers are linked to aptitudes. These aptitudes are not the same as one would expect on the basis of popular stereotypes. One may well ask why the better readers choose farming, an occupation which does not rely, as heavily on reading as do "clerk" or "professional." Why does the "professional" receive lower scores on the arithmetic reasoning than the technician who is less involved in original problem solving. Why, moreover, does the clerk receive the highest scores in spatial relations - three dimensions when a technician like a plumber and carpenter receive low scores. One may dismiss these findings by saying that ninth graders do not know their own minds or the world of work for that matter. These are, however, too poignant a set of observations to dismiss so readily. What is important to recognize is that ninth graders with known aptitudes do not necessarily choose careers in which these aptitudes are of minor importance. More needs to be known on this topic. How do the ninth graders selecting careers compare in aptitudes with those in the careers? How permanent, moreover, are the career choices?

Next to be considered are the measured interests of the students selecting the different careers. In Table 7 it may be seen that the occupational interests of students with different career choices are not alike. Clerks were found to score highest in interpersonal service, next were merchant and professional groups, lowest was farm owner. Also significantly different from one another were interests of the career groups in biology related tasks. Again the clerk and professional groups scored highest. The scores on all career groups in mechanical interests were below average. Worthy of note were the slightly higher scores of the clerical and professional groups rather than the operator and technician groups under which the several mechanical related careers were subsumed. The merchant group did not have the greatest interest in business, although below average using national norms,

Table 7

Mean Picture Interest Inventory T Scores and Career Choice

Career	Interpersonal	Natural	Mechanical	Business	Esthetic	Scientific	Verbal	Computational	Time
Clerk	56.5	55.1	44.0	46.1	43.5	49.7	48.7	46.6	45.2
Farm owner	44.9	43.3	39.6	42.8	45.6	45.8	52.0	42.6	45.5
Laborer	50.1	49.0	37.8	41.9	38.8	43.9	49.2	40.6	42.6
Merchant	53.1	48.0	39.8	39.1	44.6	47.9	48.7	40.9	40.3
Operator	49.3	46.3	41.4	44.2	42.6	45.0	49.8	43.6	43.4
Professional	53.7	53.3	44.8	47.6	44.7	50.1	49.7	45.7	46.1
Technician	47.7	44.0	42.0	43.2	42.5	45.2	55.9	45.3	46.6
F ratio	7.7*	12.43*	2.61*	3.79*	-	4.4*	3.1*	-	-

*Significant beyond one per cent level with 6df in numerator and 464 in denominator.

the "professional" and "clerk" groups scored the highest here. No significant differences were found between the groups with respect to esthetic interests. The "professional" and "clerk" groups scored the highest with "laborer," the lowest. Interest in verbal oriented occupations was highest for the technician and farm owner group and lowest for the "clerk" and "merchant" groups. Interests in occupations involving numbers and in those requiring different amounts of time for training were not different between the groups.

Using a T score of 50 as average for the population, these data were viewed another way. What were the measured interests of the career groups? The "clerk" group was interested in interpersonal service and natural phenomena. They were not deeply interested in mechanical, business, esthetic or scientific phenomena. The "farmer" and "technician" groups were interested mostly in verbal tasks. The "laborer" and "operator" groups had no deep interests. The "merchant" group was interested mostly in interpersonal service. Finally, the "professional" group was interested in interpersonal service, natural, and scientific phenomena. A rather uneven and inconsistent picture of the interests of the ninth graders emerge. The absence of interest in mechanical, business, and esthetic tasks is noteworthy because the careers selected by many, it is believed, have interests in these areas as prerequisites. Of the 54 students in the "clerk" group 87 per cent were girls. Future studies should endeavor to investigate whether girls who choose to be typists and stenographers choose so because there are opportunities available

requiring little financial investment in training. The "clerk" group composed primarily of girls so closely resemble the "professional" groups in both interests and aptitudes, that further investigation is needed. The choice of clerical occupations by girls with high aptitude scores and with wide interests is not to be condemned. Yet if these girls give up on becoming professional career women because of cultural biases about jobs women may hold, their choices cannot be condoned, either.

An ethical question devolves upon us here. Should we guide a student away from his career choice when his propensities and interests are more nearly related to other careers. In other words, should a student with many and different attributes be shown how to fit them to his career choice or should he be led toward careers which seem to require his pattern of attributes. Some teachers and guidance counselors whom the IV students have called upon for advice have been unable to help the students principally because this ethical dilemma is unresolved. While the ultimate decision is the students, the ultimate responsibility is not wholly that of the student. At the ninth grade, moreover, no teacher could tell the student what occupational specialty field he will enter, but his responsibility is <u>orienting</u> the student to specialty fields requiring experience, training and abilities.

STUDENT PERCEPTION OF CAREERS

Now to discuss the specific features of the two samples determined from the My Career surveys. The first question here is what were the career choices of the ninth graders? Each student was asked to designate the career he would like to enter. His selection was then categorized. (See Appendix B).

Table 8

Categories of Occupational Interests

	I. V.				Control			
	Pretest	Rank	Post test	Rank	Pretest	Rank	Post test	Rank
None	2	-	0	-	3	-	0	-
Clerk	35	4	44	4	33	2	29	4
Farm owner	21	6	19	6	17	5	13	6
Service	33	5	36	5	11	6	14	5
Merchant	7	7	6	7	0	7	1	7
Operator	54	3	56	3	27	4	34	3
Professional	181	1	175	1	124	1	116	1
Technical	70	2	67	2	29	3	37	2

One may observe in Table 8 that by far the most frequently chosen careers were professional; next, technical; next operator; next, clerk; next, service; next, farm owner; and least, merchant. The positions which these several career types occupy relative to one another are essentially the same for pre and post tests for experimental and control groups. From these data one may see which types of careers are most important to young adolescents and which are of lesser importance.

A more important question, however, is what changes in career choice, if any, take place over the year. In Table 9 are the career choices of the I. V. and control groups. By reading across the diagonal we may observe the number of times a student selected a career in September and selected it once again in April. In the control group, 68 per cent of the career choices were the same, in the IV group 59 per cent were the same. A chi square test was made to determine whether the two groups truly differed. A chi square of 7.074 was obtained. This means that significantly more control subjects do not change their career choice during the year. This observation may occur by chance fewer than one time in a 100.

Table 9

Changes in Careers During the Year

Original/Retest	C.	F. O.	S.	M	O	P	T
I. V.							
Clerk	20	1	2	0	3	8	1
Farm-owner	1	12	1	0	3	1	3
Service	1	1	14	1	6	8	2
Merchant	3	0	0	1	0	3	0
Operator	6	0	5	0	31	5	7
Professional	13	2	10	2	8	126	20
Technician	0	3	4	2	4	23	34
Control							
Clerk	25	0	0	1	3	3	1
Farm owner	0	8	0	0	2	2	5
Service	0	2	4	0	2	2	1
Merchant	0	0	0	0	0	0	0
Operator	0	0	2	0	16	2	7
Professional	4	3	7	0	7	97	6
Technician	0	0	1	0	3	8	17

This is a second source of evidence, then, that the vocational interests of the IV students change more during the year, the other source was the lower test-retest reliability coefficients on the Picture Interest Inventory.

Also in Table 9, a note should be made of the shifts in interests. The largest shifts are toward the professions. Twenty-four per cent of the IV group shifted toward the professions; 16 per cent of the C group shifted toward the professions; 16 per cent of the control group did so. The differences are not significant. The group shifting the most is the technician group. Using this scoring of the careers, it was determined that the control group shift less. Using a second scoring system, to be presented later, shifts in field of interests and levels of responsibility were found to be different for the groups.

Table 10

Training Requirements of the Career

Specificity and Relevance	I. V.		Control	
	Pretest	Post test	Pretest	Post test
General-relevance	243	241	106	118
Specific-relevance	109	102	79	87
General-irrelevance	36	36	36	17
Specific-irrelevance	6	18	18	12

Examined next was the specific knowledge each student had about the training requirements for his chosen career. Table 10 reveals that there were few differences between the two groups before the training, and few when the training was terminated. Both groups have general notions about what training will be needed, but a smaller percentage have specific information about the training requirements. For example, a student planning to become a brickmason should know the length of apprenticeship training; a student wishing to become an engineer, should know he has to attend a college of engineering four or more years. This specific knowledge was lacking from both groups. But it was hypothesized that the IV group would know more about training requirements. No support for this hypothesis was obtained.

Next to be examined was the reasons for choosing a career. Two factors were considered here. The structure of the reason, that is its clarity (maturity) and the content. In Table 11 is the degree of differentiation of the reasons. The

Table 11

Maturity of Explanation of Choice of Career

	I. V.		Control	
Explanation	Pretest	Post test	Pretest	Post test
Vague	257	207	160	198
Clear	728	762	434	465
Very specific	68	88	29	18

total number of reasons increase for both groups. On post test a slight superiority of the IV group may be observed, they gave five per cent more very mature reasons than did the control group. Both groups gave relatively clear explanations for their choices, approximately 67 per cent of the total number of responses. A chi square test was made of the post test distributions. The ratio of 18.53 was observed, this means that in fewer than one case in a thousand could these observations have occurred by chance. Although only five per cent more students in the IV groups gave replies indicating great maturity, it was, nevertheless, sufficient to point out a major difference between the groups. To some extent, the hypothesis that the IV students become more mature in reasons for selecting a career is sustained.

Examine in Table 12 the relationships between pre and post test clarity of responses in each group. Whereas, the clear responses of the IV group became more specific, it is less so for the control group. To be sure the differences are not overwhelmingly in favor of the IV group.

Table 12

Clarity of Response: Relationships

	I. V.		- Post test -	Control		
Pretest	Vague	Clear	Very specific	Vague	Clear	Very specific
Vague	82	145	19	55	97	3
Clear	153	497	52	109	287	13
Very specific	17	41	10	5	21	2

The content of the responses was considered next. The most frequently cited reasons were that of the "wish" or "belief" types. Students said that they feel they may make a good pilot or beautician; next in importance, was designation of interest in the task they were to perform. For example, they might say they liked to tinker with cars or motors; next, was interest in the financial remuneration; next in frequency, was the good feeling they would have working with people. Some over-all changes between the groups should be noted, the IV group tended to give more reasons on the basis of past successes than did the control group. In addition, the percentage of "wish" reasons declined, whereas, the percentage of "wish" reasons for the control group increased. The IV group became less interested in the things of a job and more in the functions and roles displayed; the reverse was observed in the control group.

At the beginning of the study there were no differences between the groups with respect to categories of reasons. Examining the subtotals for predisposing factors, intrinsic factors and consequences, there were no differences between the groups (chi square, 5.41, 2df). On retest, however, there were differences between the groups (chi square = 6.60, 2 df). A much greater interest was displayed by the IV group in factors intrinsic to the job. Not only was the IV group more interested in functions and services, but they were also more interested in the physical surroundings of a job, i.e., whether it was indoors or outdoors.

Data from a table not to be presented here reveals that 20 per cent of the reasons given by the control group and 23 per cent of the reasons given by the IV group were unchanged during the year. From these data it is difficult to state whether the instrument is unreliable or whether reasons for entry into a career change because selection of a career itself changes.

Before turning to the next question, some other characteristics of the samples should be noted. A fair percentage of the responses indicated student reasons for

their career choices were altruistic. They wished to perform services which might be of benefit to humanity. The interest of some students in simple work with plenty of leisure may merely reflect the attitude of maximum return for minimum effort. Reasons for choosing the same career, were, moreover, observed to be quite varied.

Closely related to reasons for entry into a career are the joys, values, and satisfactions anticipated. In scoring the student responses to this question, the replies given were similar in content to reasons for entry. Occasionally, students cited the very same reasons for entry into a career as they did for joys anticipated. In Table 14 are the listing of joys anticipated.

Comparisons were made between intrinsic and self enhancement values for the pretest IV and control scores. The resulting chi square of 5.40 indicates that prior to instruction there were no significant differences between the groups. The leading satisfactions were those derived from being near people, earning money, non-specific joy, and service to people.

When the students were re-examined, however, there were highly significant differences between the groups. A chi square of 18.05 was obtained. The joys which appeared to be most important during the pretest were still important. Increasing in importance, however, were factors intrinsic to the career. The IV group more than the control anticipated joys derived from performance of functions on the job. One student put it this way, "I just want to drive trucks." The students were asked to evaluate the traits they had which they believed would be required in their career. Also they were invited to name the traits which would be required which they did not believe they had. In Table 15 are the student replies to these questions. Both groups considered personality, work interests, and ability assets which they believed were required on the job. The marked

change in noting personality traits in the IV group should be observed. Whereas, 27 per cent of the IV and 28 per cent of the control group pretest responses were personality traits, 35 per cent of the IV and 24 per cent of the control group post test responses were of personality traits. There was a fair percentage of responses unrelated to the question. Students cited, training, experience, and money as traits.

With respect to traits necessary but not present, by far the largest percentage of replies were left blank. Next in importance were personality, knowledge, and training. This could be observed for IV and control groups for pre and post test. Here personality looms as the most important deficit to the IV group on the retest.

It may be said, then, that the IV course makes the student more acutely aware of the personality adjustments he is going to make as a worker. The alertness to one's personality attributes is not at all unrealistic when employers are known to hire and fire less on the basis of work habits or competence and more on his adjustment to co-workers. In scoring the protocols, one observation was inescapable. Students listing some personality trait such as "understanding of others" as a characteristic which is necessary and which they have might list under traits not present, "I don't always understand others."

To be completely aware of all facets of career choice, a student should not only anticipate certain satisfactions, and know the traits necessary for vocational adjustment, but should also know what dangers to anticipate. In Table 16 it may be observed that from the very beginning, the greatest dangers to the IV and control groups were those concerned with performance of the job, such as crashes, electrocutions, becoming diseased. Forty-eight per cent of IV and 45 per cent of control

Table 16

None	25	20	12	9

group replies were of this type. On retest, however, 60 per cent of IV replies dealt with dangers inherent in the job which are intrinsic to the service. Forty-two per cent of the control group replies were of this type. Far greater concern for mistakes which the worker might make was elicited from the control group than from the experimental group. Here, again, the knowledge acquired in the IV course directed the students' attention to important facets of a career, overlooked by the control group.

Also of interest was how mature are the students in judging dangers of the career. That is to say how vividly do they describe the anticipated dangers. Originally, the IV students were clearer in their understanding of the dangers of

Table 17

My Career: Dangers: Structure

their career. By the end of the year, they gained somewhat, and the control group tended to become less clear. Thirty-four per cent of the IV responses were scored "vague" but 42 per cent of the control group responses were so scored. The IV group did gain in maturity of judgment about dangers, the gains were not as great as may have been anticipated, but they were greater than those made by the control group.

The activities of the groups in developing a better understanding of the careers were studied next. In Table 18 are the categories of people with whom the student discussed his plans. By far the most frequently designated group of people

Table 18

My Career: Discussion of Plans

Worker	40	47	29	38
TOTAL	540	642	346	379

with whom the students discussed career were "family members," primarily parents. This constituted slightly more than 50 per cent of the replies. The pretest percentage of replies for both IV and control group for teachers was 15 per cent.

The control group did not change during retest. The IV group did. Twenty-four per cent of its replies were "teacher." The IV course, then, affords the student an opportunity to discuss his plans with a professional person, who although not eminently qualified in the field of vocational guidance, will, nevertheless be cast in a position in which his professional advice is sought. What significance to attach to the very small percentage of "counselor" replies is not known. Some schools do not have a counselor. Even in schools employing counselors, students may either be reluctant to visit the counselor or the counselor may be too busy to help them.

In Table 19 are the replies to the question dealing with what the student has done so far to learn about his career. The most prominent prevocational activity

TOTAL	451		534		282		311	

is "reading." Both groups read more about vocations during the year. More reading took place in the IV group. The IV group tended to discuss vocations more than the control group, but in most other respects the groups did not differ much.

In many respects, the control and IV groups differed only slightly at the end of the year. But there were many significant differences between the groups. It was noted that the IV group had a greater understanding and appreciation of the many factors inherent in a career. They seemed also to engage in more prevocational activities than the control group.

The data reported thus far indicate what general changes took place in both IV and control groups. The differences between the groups suggest what could be expected when ninth graders are exposed to self analyses of abilities and interests, occupational surveys, and ideas about the world of work. It may be well to examine

individual protocols of IV and control students to determine the likenesses and differences between the groups.

Five pre and post test My Careers were selected at random from both IV and control groups. It was believed that random selection of protocols would present a more balanced picture than would selection of the best and worst examples. The five IV students are represented by letters A, B, C, D, and E; the five control students by, F. G. H; and J. Notice Table 20, career choices and reasons for entry are presented. In the IV group, reasons in the post test were very similar to those in the pretest. Some reasons become clearer, moreover. "You learning will keep you from turning into a bum" "pleasure out of seeing your building plans go into the real thing" contain specificity absent in the pretest. The reasons given in the control group retest were very much like those given in the pretest. The sepcificity observed in the IV group is not as prominent in the control group, although it may be observed somewhat.

From Table 21 it may be observed that the control group do develop clear ideas about the training needed to realize their vocational aspirations. The IV group appears, however, to develop the clearer ideas. Notice student D. He became aware of the need for college training and an apprenticeship.

The tendency for students to list the same traits under both present and absent may be seen in Table 22. In addition, the listing of traits by the IV group is more precise than that of the control group. Note student C who on pretest cited "trying to begin a nursing course" for traits present; on retest she listed "honesty," "neatness," "manners." With regard to traits absent, on pretest she listed "in becoming a bad nurse and not cooperating," on retest, she listed "finger dexterity, enough education." It may be observed that many students were unfamiliar with the meaning of the word "trait." Some mentioned education, training, and money in answering this question.

Changes in values of career choice may be observed in Table 23. Changes over pretest in both groups are slight and toward greater specificity. It would appear that greater emphasis should be placed on the joys, values, dangers, and threats of each career.

Table 24 reveals that the IV students by far were more active in learning about careers. They spoke to more people, read more articles, and studied with greater intensity. This finding is not unexpected. It is reassuring nonetheless.

Finally, the alternative choices of the IV group seem to have greater substance than those of the control group. The choices of some students do not change at

all during the year. (Table 25).

By reading the corresponding letters on Tables 20 through 25, the picture of each of the careers of each of the ten students emerges. The roles of money, service, and affiliation in career choices may be observed for each student. Naivete in expecting certain outcomes from work may be observed as may maturity. The changes in some individuals were slight, in others like E they were dramatic. Even E's penmanship improved.

D. Lawyer	Engineer	Orthodonist	Lawyer
E. Brickmason	No response	Constructor	Truck driver

Due in part to the lack of complete scorer agreement on career classification, a second scoring system was used for certain portions of the data. It was based on the classification of occupations according to interests and levels of responsibility. This system was proposed by Roe (1956). In a random sample of 100 protocols were rescored according to Roe's classification, there was 95 per cent agreement between two scorers. Roe's system involves categorizing six levels of responsibility for eight occupational interest levels: service; business contact, organization - business detail, physical science - technology; outdoor - physical, biological science, general cultural, arts and entertainment. An example of personal social service at a high level of responsibility is a social worker; at a lesser level is a detective; lesser still, barber; lowest, watchman. Reanalyzing the alternative choices of the experimental and control groups, differences between them will be observed. The alternative choices were studied in the following manner: 112 students from the experimental group and 114 students from the control group representing five different schools were selected at random. The levels and fields of responsibility of the first and alternative choices were determined. Roe's tables served as guides. It was possible for the level of

responsibility of the alternative choice to be lower, higher or the same as the first choice, it was possible for the interest field of the second choice to be the same or different from the initial choice.

Examine Table 26 below. Whereas, the control group tended to select an alternative career which was lower in level of responsibility, the experimental group tended to select one which was of the same level of responsibility. The tendencies of the two groups are significantly different. Both groups tended to choose alternative careers from different fields of interests. The experimental group,

Table 26

Changes of Level of Responsibility and Fields of Interests

Different	64	71	
None	0	19	26.62*

*Significant beyond the one per cent level of probability

though, more often remained with their original interest fields. Another difference was that 17 per cent of the control group gave no alternative choice at all. This was in sharp contrast to the experimental group who always cited a second field of interest. This suggests to the writer that the experimental group is better prepared for exigencies arising out of failure to achieve vocational aspirations.

An inquiry was next made into the contributions which earnings, future openings, mental ability, and prestige plays in career choices. On the Business Information Survey (BIS), the students were asked to rank in order of increasing importance, the seven career types. The rank position of the career of his choice was determined from My Career. If a student chose to be a school teacher and he ranked professional 6; earnings 7; openings 5; mental ability 4 and prestige 1; it indicated that at least one career, in his own estimation, made more money, two careers had greater employment opportunities, four had lesser mental ability requirements, all were of greater prestige. Table 27 reveals the median rank,

Table 27

Merchant	-	-	-	-	-	-	-	-
Operator	5	5	4	4	5	5	4	4
Professional	7	7	7	7	7	7	7	7
Technician	6	6	6	6	5	6	6	6

that is the rank designated by the person midway in each distribution. Viewing these findings in the context that 1 is lowest and 7 is highest, the following observations may be made: there are negligible differences between the groups at the beginning and at the end of the academic year. In addition there are few differences in the average rank given each attribute (earnings, openings, mental ability, and prestige) within each career category. Note "clerical" they ranked most attributes 4 or 5; "farm owners" 3 or 4 on pretest, 2 or 3 on retest; "service" 1 or 2 on pretest, primarily 1 on retest; too few students selected "merchant" so this category was not analyzed; "operators," 4 or 5; "professional" 7; and "technician" 5 or 6. There seems to be evidence for a common factor. At the present time it is not possible to determine what it is. Yet it may be noted that students going into service occupations, such as "police," "laborer" do not see their careers as offering them money, prestige, or employment opportunities. This may be noted also for farm owners. Those going into clerical and operatives, foresee

a better position in life; those going into the technicians, an even better position; and those going into the professions, the best.

These observations open new lines of inquiry. Might these rankings represent self concepts as future workers? Might they represent the current aspirational levels of the students. If so, is it possible to raise these levels through instruction? The meager differences between the IV and control groups on post tests indicate that this did not take place. The question of whether it could be done if instruction is zeroed in on better understanding of aspiration levels could be answered by future research. Finally, the student observations may merely reflect the esteem in which these careers are held by society in general.

Table 28

Median Ranks of Alternative Choice on Business Information Survey

	I. V.				Control			
	Earnings	Openings	Mental Ability	Prestige	Earnings	Openings	Mental Ability	Prestige
Pretest								
Careers								
Clerk	3	4	3	3	3	4	5	5
Service	1	3	1	1	1	2	1	1
Operators	5	5	5	5	5	6	5	4
Professional	7	7	7	7	7	7	7	7
Technician	6	6	6	6	5	6	6	6
Post test								
Clerk	4	5	5	5	4	4	5	4
Service	1	2	1	1	1	2	1	1
Operators	5	5	5	5	5	4	5	5
Professional	7	7	7	7	7	7	7	7
Technician	6	6	6	6	6	6	6	6

Making these aforementioned observations even more poignant are the average rankings of earnings, openings, mental ability and prestige for alternative choices. Table 28 reveals negligible differences between IV and control for pre and post test. The "farm owner" and "merchant" careers were omitted from this analysis because there were but a few votes for these careers as alternative choices. Comparison with Table 27 suggests strongly that the careers are being evaluated

with the same criteria irrespective of whether it is first or second choice. Earnings, openings, and prestige are still ranked low by those selecting the service careers, moderately by those selecting clerk and operatives, and high by those selecting technicians and highest by those selecting the professions.

Perspective of the World of Work

The world of work has several dimensions. The Business Information Survey measures five. Students were asked to arrange in order of importance the seven career categories for each of the dimensions. Rankings were compared with the keys. (See Appendix A). The method for scoring BIS was discussed in the procedure. Briefly, the score which one received depended upon the degree to which the student arrangement agreed with the key. The five possible scores were: 1. high, positive relationship, 2. moderate, positive relationship, 3. no relationship, 4. moderate, negative relationship, and 5. high, negative relationship. For instance, the key for "earnings" is F, L, O, C, T, M, P. Should a student arrange them L, O, C, F, P, M, T, the rank order correlation would be +.64. This signifies his rankings have a moderate, positive relationship with the key. In addition to objective scoring, BIS was scored subjectively. The degree to which a student's rankings for an item agreed with the arrangement of his responses to the item, "the business I plan to enter." Should the previously mentioned student answer this item L, T, C, M. O, F, P, he would be scored "no relationship" for the "earnings" item.

The first dimension to be studied was "earnings." In Table 29 are the pre and post test scores of the IV and control groups. Only three of the categories appear because so few students scored negative, moderate and negative, high. No differences appear between IV and control group for either objective or subjective scores for both pre and post tests. This may be due in part to the fact that at the very beginning both groups had a good grasp of the relative earnings of the several groups. It is clear from the significant chi squares obtained between the post test objective and subjective scores, that earnings concepts are more closely related to objective reality than to the student's plans for entering the career.

Next, perception of number employed in the careers was measures. (See Table 30). At the beginning of the study, there were no differences between IV and control groups. For either the objective or subjective keys. At the end of the study, significantly more IV students were considering the number employed in careers on the basis of their own plans for entry than control students (chi square, 13.57). Both groups tended to view number employed from their own point of view

Chi Square	103.54*				38.46*				

of objective facts. This finding was more prominent in the IV group. Generally, there was no relationship between student replies and the Objective Key; for the IV group there was considerable relationship between their plans for entry and their judgment of the number employed. This was not observed in the control group.

Job openings perspective was studied next. In Table 31 are the results of several analyses. Both before and after training the IV group did not differ from the control group on either the objective or subjective scoring keys. Any changes taking place in the IV group over the year were not attributed to the course.

Table 31

BIS: Job Openings

	I. V.			Control			
	H+	M-	0	H+	M-	0	Chi Square
Pretest							
Objective	118	117	114	55	65	75	2.41

Subjective	189	83	79	96	50	60	2.49
Chi Square	8.36*			5.36*			

The majority of the responses of both groups indicated that students were quite aware of the job openings for the several careers. Unlike in the control group, in the IV group, student rankings of the job openings were more closely related to their own plans for entry than to the objective facts.

The mental ability requirements of the careers were considered next. Differences between the IV and control groups for pre and post test scores are negligible. From the very beginning the majority of the students were quite aware of the spectrum of mental ability requirements of the several careers. It is clear from Table 32, moreover, that rankings of the careers on this attribute was more closely related to the objective facts than it was for the students preferences for entering the careers.

Finally, to be considered was the prestige of careers. In Table 33 it may be observed that the IV and control groups did not differ from one another on either pre or post tests. Student rankings of the careers are moderately related to the prestige and honor accorded these careers. In both groups, however, the extremely significant chi squares resulting from comparing the objective and subjective scores for students indicate that the prestige accorded a career is more nearly related to one's plans for entry than to the esteem in which the careers are held.

In general the IV and control group resembled one another in their grasp of the five dimensions measured in the BIS. Not only did they resemble one another before the study began, but they were not found to be too different from one another at the close of the study. They understood well the earnings, openings,

and mental ability requirements of careers. The grasp of prestige of careers was good. There was, however, little relationship between student concept of number employed and the rank order of the number employed in the several careers. Almost every comparison between the objective and subjective keys revealed that student replies to the questions were significantly different from his rankings of the careers he planned to enter.

Student Reactions to the Program

Tests of the hypotheses give information about one phase of the program and results of the achievement tests of another. It was important to learn, however

what attitudes were generated by the course. Four questions were raised to shed light on this objective. From 327 student replies selected at random the observations to follow were made.

To the question "what did you learn in IV that you would not have learned in other courses," 158 students cited types of occupational information; 35, educational requirements for careers; 34, jobs suitable to student interests and abilities; 31, job requirements; 25, procedure for filling out applications; 31, economic outlook for several careers; 19, job opportunities; 8, classification of jobs, and 7, world of work. There were a number of single responses like "control of emotions" "how to be success" "learned about myself" "learned to express myself" "dangers of the business world." It may be concluded that most students acquired information. Some, however, tried to apply the information to themselves. In this way they made the facts personally meaningful.

To the question, what advantages are there in IV? One hundred forty said they learned about jobs; 84, find out what they wanted to become; 22, learned how to seek and apply for a job; 21, field trips taken; 15, none; and 11, educational requirements of a job. There were several single responses such as "interviews" "job pay" and "world of work."

To the question, what did you dislike about the course? One hundred seventy-three said nothing; 21, no textbooks; 18, not enough field trips; 21, boring; 16, too much letter writing; 5, course geared toward boys; 5, too many notes to take; 5, everything; 3, giving oral reports. Again, there were single responses such as "work" "tests" and "not enough speakers."

The final question was would you recommend the course to other students, 324 said "yes," 25, "no."

From the student reactions to the course, it may be inferred that the students favorable attitude toward the course results from its relevance. It fills a void in their secondary school education. The fact that 93 per cent of the students would recommend the course to their friends is an overwhelming endorsement of the course.

RECOMMENDATIONS

When first conceived the bare essentials of the Introduction to Vocations were only imagined. The uniqueness of the course did not permit consulting similar courses for direction or organization. Most consultants to the project believed that giving the IV teachers a semblance of structure would be sufficient. Freeing them to explore, to create, to innovate and to reject their innovations would be the necessary atmosphere for them to learn how to teach the course most effectively. It was conceded that the absence of a controlled procedure would limit any results obtained about the course, but at the starting point it was more important to emerge with a reservoir of hypotheses and procedures than to come up with meager but accurate facts.

Now a wealth of hypotheses about vocational choice has emerged. Knowledge of the characteristics of the sample is such that success in the IV course may be somewhat predictable. This study informs us what are some of the prognostic signs. In addition, other relevant information is available. The low reading comprehension but adequate vocabulary of the ninth graders suggests that teaching of reading skills specific to economics, occupational information, and tests and measurements are in order. The relatively low vocational interest scores suggest that instruction should be not only geared toward narrowing interests to two or three fields but also toward intensifying these interests.

Perfunctory note taking of classroom discussions could not increase student awareness or understanding about the world of work. Memorizing the number of workers in an occupation or the average salary of secretaries is hardly functional. Both will change before the student completes the course. Rather what is important is to know the pay scale of certain careers relative to other callings in certain geographical areas. Contrasts between careers and between areas are necessary.

A major limitation of instruction is the absence of reference points which are alive for the student. A student may read about the training requirements for a teacher or a lawyer. If he were to talk with representatives of several careers about what preparation they had, the words in the book would make more sense.

Research material was not always available to the teacher of the students. The need for adequate funding of the program goes without saying. But where the materials were available, students were prone to copy verbation from the text. In class, they would recite their report which would contain expressions the

reporter himself would not understand. These expressions would, moreover, be copied by the class members. Hence, there was a proliferation of incomprehension. It should be more important for students to communicate with spontaneity the ideas, facts, and beliefs which they learned about than to recite verbalisms. This communication should contain words which are within the listening vocabulary of the students. The lessons of IV should not be an amassing of empty and barely relevant facts but rather the development of understandings.

Teachers reported that students do not know now to study. It might be well to teach them how. Accurate study habits teach students the value of work in general. Study could become a satisfying and enlightening experience if the student is required to survey the reading material first. A survey permits the development of general ideas about the material. Clues to general ideas may be found in chapter and section headings as well as in the summary. Next, he raises questions about what the survey indicated. He also reads the questions which most textbook authors place after the summary. The question serves as the motivation for learning. It is this knowledge thirst which drives him to learn. Now motivated, the student reads his text to find the answer. When he discovers the answer, he writes a summary <u>in his own words</u>. Frequent review of notes made of each section insures recall. Students should be encouraged to find ways to use the material.

Both students and teachers prepare oral reports. The purpose of these reports was to clearly inform students about new avenues of exploration which they had undertaken. For student audiences to jot down what reporters say will remind them at a later date about some unfamiliar ideas. Unfamiliar ideas, it must be acknowledged are easiest to forget. For students not to take notes actively during class signifies that the discussion will quickly evanesce. Proper work habits involve attention to all new incoming stimuli. The absence of note taking means that the student has no clues to "stamp in" learning or to explore ideas further.

Many teachers used a deductive approach to learning. Students were <u>given</u> a set of assumptions, beliefs, rules, and practises. Assignments were given which were to fill in the details of each. This approach has merit and should not be discarded. At the same time, it is well known that students have their own assumptions, their own beliefs, their own "facts." Their assumptions often conflict with that of the teacher. It must be remembered also that in his own vocational developmental level the teacher mainfests realism, but the student's vocational thinking is still fantasy and interest oriented. It is necessary in the educational

process for the conflict to be resolved. Too often, the conflict is not recognized or if recognized it is suppressed and the student has no option but to learn the teacher's point of view.

To prevent this situation, the method of self discovery is recommended. What this involves is the student coming to grips with his own problem. He defines it, he notices any changes in vocational attitudes with the passage of time. He may keep a weekly log for these notations. Scores on tests of aptitudes and interests will inform him where he stands on these attributes relative to other ninth graders. Tests of knowledge about the world of work will inform him about his knowledge deficits as well as the accuracy of his information. With these as starting points he could become more aware of himself and the accuracy of his judgments through reading, discussion, interviews, and trial explorations of several types of work. The focus would be on the student's beliefs. The ideas and facts which will stream in from reading, discussion and counseling will permit him to revise his perceptions. This approach differs from traditional approaches in several ways. The chief difference is that under self discovery, awareness is increased gradually and as a result of the student's own experimenting. The more traditional approach requires the teacher to speak as an authority and impose <u>his own</u> reality on the student. The first approach is more meaningful and hence could be expected to result in more permanent retention of knowledge, skills, and values. The second approach often is enforced by the threat of marks and is more closely related to acquiring knowledge than its retention.

Discipline in the self discovery method is present and well defined. It involves the student stating hypothetically his perceptions, beliefs, and knowledge, then gathering data about himself through such activities as reading research, participating in interviews, discussions, field trips, teacher and visitor lectures, and film viewing. The student next examines his behavior during these activities and relates them to his original hypotheses. As a result of the comparison, new hypotheses emerge which will subsequently be tested. The teacher's role in this process is as a guide. He helps the student wipe the mirror of self clean so he may see his behavior more clearly. Sometimes this guidance is indirect by exposure to new stimuli through reading, field trips, job analysis; sometimes it is direct by stating affirmatively what are the consequences of the student's behavior.

This proposed procedure depends on early and correct identification of the student's abilities and interests. This means testing. Standardized test results

have restricted meanings. All scores refer to some status in a specific population. As such evaluations such as "good" or "bad" scores are inappropriate. Rather the score designates the position in the standardization population. Some tests have inherent weaknesses which are pointed out in the test manuals. All test companies, moreover, publish the standard error of measurement, the figure which indicates the amount of test score fluctuation due to chance factors. Many teachers considered themselves incompetent to explain test scores to students. Others were reluctant to give low scoring students their results. Increasingly, standardized tests are being used in schools and industry. It is mandatory, then, that both teachers and students become more knowledgeable about tests their scores, and their meanings.

Another consideration in the self discovery method is the absence of teacher authoritatianism. Teachers can ill afford to state emphatically what are the several aspects of the world of work today because by nightfall it will change. The face of our economy, moreover, is constantly changing. Rather than give a detailed picture of today's economy with its receding hair line, furrows, and moles, the teacher should delineate the conditions which affect employment, prosperity, and vocational satisfactions. What is a fact today is largely irrelevant tomorrow. But the conditions which produced the fact are important to recognize and understand. Rather than learn that there are 28 per cent fewer farmers today than in 1920, it is essential that students learn factors associated with vertical and horizontal social and economic mobility, urbanization, and industrialization.

Thirty years ago women who held professional and clerical positions were largely unmarried, divorced, or widowed. Today, women are marrying young, raising families, and then entering the labor market in their thirties. This trend, unknown years ago, signifies a redefinition of the woman's role as a worker. Careers largely reserved for males are increasingly finding women in their ranks. Sex qualifications for many careers are changing. Women doctors, lawyers, business executives, welders and male nurses, elementary school teachers, secretaries are but a few examples. Increasingly the trend toward dedifferentiation of sex linked worker roles is taking place. Students are living in an exciting time. Traditional employment practises are being rejected and being replaced by new, untried practises. The IV course should not only reflect these changes, which it has done, but also prepare students for many and frequent ones.

Perhaps, accelerated by civil rights legislations, racial barriers to employment are disappearing, too. The impact of discrimination in employment on

national economic factors such as production and income as well as on personal psychological factors such as sense of adequacy has to be discussed in an atmosphere of detachment. Teachers of the two major racial groups in North Carolina have asserted that their students fear they will be unemployed largely because of the competition offered by members of the other race. Regrettably, some teachers have fed on their students fears. To be sure, there have been injustices in employment in the past, but what is incumbent on the IV teachers is to provide an atmosphere in which students may recognize these injustices, become aware of his own beliefs, and then learn that competence will be the basis of employer evaluations of worker behavior. Extolling the virtues of honesty, craftmanship, achievement, and merit in the IV course would render much ethnic prejudice inoperable.

The freedom teachers had, it was cited earlier, was necessary in order to discern the several paths to teaching IV. To facilitate future research and experimentation, greater control over content should be exercised. The topics covered should be the same from school system to school system. The amount of time spent on each topic should be standard. Certainly if one teacher spends one week on economics and another spends six, differences are expected to appear. Basic text materials should be given each student. Since there are many inadequate readers, adjustment of language to readers skills is vital. Although not basic to IV it would be well to program reading improvement to permit greater realization of self through reading. The value of invited speakers, field trips, and films have been demonstrated. The increased organization and control over the course will lend itself to more accurate researching. Increased structure would not destroy incentive to innovate. There can never be enough new teaching ideas. Rather what is needed is course structure and content which is comparable around the State.

Adjustment of content to different mental and reading ability is another consideration. The basic outcomes of the IV course are to be attained by all students. If the tools used to reach these goals are inadequate teaching methods should be found which may be used to reach all students. The unit method is such an operation. The objectives of the series of lessons known as the unit are known and adopted by all students. The teacher, then, provides suitable activities for students varying in abilities. Some may reach the goals through independent research, others through reading basic texts and supplementary materials, others by listening to class discussion, others by participating in class discussion,

and still others by going on field trips and/or viewing films. Measurement and evaluation should be of attainment of the course goals rather than of the means of attainment.

This is not to say that reading, writing, and speaking are unimportant. Greater facility with the communication arts is needed. The spelling, diction, reading comprehension errors need correction. Students will write business letters, they will be interviewed, and they will be expected to demonstrate reading skill. The point being made here is, rather, that an IV student should neither be penalized by low grades for inadequate communication nor rewarded by high marks for clear but irrelevant communication.

Teachers and students reported favorably on mock interviews. Whenever possible interviews should be tape recorded. In this way students would become more aware of their own speech patterns. It is easier to correct one's self when he hears his own sentence structure than when someone merely tells him he is wrong.

More practise writing business letters is recommended, too. Students should be encouraged to write letters to obtain business information on their own. Teachers have done most of the writing of requests. Not only will teachers be relieved of time consuming duties, but students can learn that they are responsible for their own learning. Greater investment of student time and energy in the course may very well be sufficient motivation to improve communication skills. Good models for writing business letters should be provided.

No course in vocations should undertake to study each and every aspect of all careers. Rather a representative sprinkling of the several career types would be a more realistic aspiration. Due to lack of materials, money, or time, students were not given sufficient opportunities to taste of the different careers. Opportunities should be provided to observe workers in action, including porters, waiters, secretaries, lawyers, doctors, engineers, and truck drivers. Whenever possible, opportunities to develop simple pre-entry skill for an occupation. The experience for many of the students may determine whether or not they will stay in school. Also, a student may select from available work study programs one in which he became actively involved as an IV student.

The study shows that IV students did search for a self concept as a worker. Many students had plans firmly crystallized during the course. Others, however, were unable to find themselves. For such students vocational counseling was not always possible. IV teachers did try to make suggestions to the student with

mixed feelings about his calling. Often, however, the IV teacher had no training as a counselor and was unable to give professional help to the student. Guidance counselor cooperation with IV teachers during this phase of the program was warmly received. How to identify such students and how to fit them into the counselor's already heavy load was most difficult. Yet the concern was great for students who could not establish direction to his vocational life. Simple solutions to his problems were unavailable.

Students should become more sharply aware of the values and dangers of their proposed callings in order to view them in proper perspective. The adult world of work will not come as such a shock when the young worker knows beforehand what joys and harms to anticipate.

The IV course is a novelty. Like all novelties if it is not regenerated it soon fades. Constant alteration of the course toward increased relevance for the student is recommended. Some materials could be programmed, more on the job experiences and improved methods of self evaluation are but a few ways to acquire new vigor.

Finally, frequent follow-up of both control and experimental group will determine the degree to which IV affected the destinies of young North Carolina ninth graders. Annual re-evaluation of the students will permit the charting of their vocational development.

SUMMARY

Introduction to Vocations (IV) is a new course instituted in the ninth grade curriculum in selected schools in North Carolina. The course familiarizes the student with the world of work, economic factors related to labor, current employment trands, and training requirement for the several careers. In addition, students were tested to determine aptitudes and vocational interests. Scores were explained, discussed, and correlated with information acquired about occupation. Low concepts of self as workers, occupational misfit, and constant revision of employment needs and trends within the economy of the United States were sufficient justification for offering the course.

IV teachers were selected by their superintendents to attend a summer training institute. Teachers were recruited largely from vocational agriculture, industrial arts, home economics and guidance fields. Supervisors of the project planned two approaches to the IV course. One was to be the individual teacher instructional plan and the other was to be a team approach involving the IV, English, mathematics, and science teachers. The summer training institute, therefore, included subject matter specialists, also.

The outline for the course was developed by H. E. Beam. Lesson plans and activities were contained in it. The teachers discussed and implemented the several ideas presented in the outline. During the academic year 1963-1964, the teachers could orient themselves to the several IV topics by using the outline. Wide latitude was provided the teacher, however, to elaborate upon the outline and to introduce new ideas.

Plans were made in August for evaluating the outcomes of the project. The questions one asks limits the kinds of information the research worker will be able to obtain. While there are many possible outcomes to evaluate, only a few were selected for study. As a result many knowledge and attitude changes were not studied at all.

Certain beliefs guided the phrasing of the research questions. It was believed that the IV course would make such an impact on the students that he will become more serious as a potential worker. Changes in aptitudes and vocational interests, therefore, were predicted. Vocational thoughts of the young adolescent are known to be a result of fantasy and wishing. It was predicted, therefore, that a fact oriented occupational information and self inventory course would develop more realistic thoughts about the world of work. The course, it was further

expected to become more concerned with the features inherent in their career choice than with irrelevant factors. Educational requirements of careers were to be more easily grasped. Greater awareness of the joys and dangers of careers was anticipated. A more active seeking of occupational information was expected. For that matter, vocations were to be the orienting foci of the students' lives. Achievement in the course, it was believed, could be explained on the basis of known characteristics of the students. Team teaching, it was hypothesized, would yield better achievement results than the individual approach. Because of the multidimensional nature of this project and because computer programming has advanced markedly, many interrelationships could be found even though they were not intentionally sought.

Growth in knowledge and changes in attitudes appear to take place as a function of time. It was impossible to determine whether the outcomes of the course were realized if a second group similar to the IV students received no training. The superintendents of schools offered in addition to IV students comparable students to serve as a control group. Statewide, it may be said that there were few initial differences in aptitudes and interests between the two groups.

The validities and reliabilities of the tests used were designated to point out the degree to which the findings presented may not be completely faithful or accurate. Chance factors, it is well known, operate in any testing situation. They cause the observed test scores to fluctuate around the true scores. The tests used in this study were the Multiple Aptitude Tests (MAT); The Picture Interest Inventory (PII), Standardized tests published by the California Test Bureau, the Business Information Survey (BIS), My Career, and the final survey, unstandardized tests developed by the writer especially for this project. The MAT measure specific aptitudes like verbal, spatial and numerical. PII yields scores on vocational interests in interpersonal relationships, mechanics, nature, business, words, and numbers. BIS yields two types of scores: Objective and Subjective. The Objective scores reveal the degree to which the students' ordinal arrangements of seven major career groups agree with their actual arrangements for employment opportunities, mental ability requirements, earnings, and prestige. The subjective scoring key reveals the degree of relationship of the students' arrangements of the careers with his own career plans. My Career reveals the kinds of careers students plan to enter, reason for entry, educational requirements, traits required, joys and dangersanticipated, and steps taken to learn about the career. The final survey was a series of true-false items about economics,

occupations, and other facets of the world of work. Items were taken from the content of the IV courses taught throughout the State.

Students were tested at the beginning of the academic year and again seven months later. The second set of scores were compared with the first. Changes in aptitudes and interests of both experimental and control groups were not different from chance. High group scores on pretests were lower on retests; low pretest scores were higher on retests. This is the familiar "regression toward the mean" phenomenon which takes place during retests merely due to the original statistical deviations or errors which cause scores to fluctuate. The hypotheses dealing with improvement in the IV group in aptitude and interests were not tenable. The individual members of the IV group did change considerably in their aptitudes and vocational interests. These changes for individuals far exceeded changes made by the individuals in the control group. Greatest changes were noted for the following characteristics: aptitudes for arithmetic reasoning, applied science and mechanics, and interests in mechanics, business, esthetics, science, words, numbers, period of career training.

These findings should be viewed in the context of the scores originally obtained on the two groups. In reference to the national average, the groups were above average for the following aptitudes: word meaning, arithmetic computation, applied science and mechanics, and spatial relations - three dimensions, but below average in paragraph meaning, arithmetic reasoning, and spatial relations - two dimensions. The vocational interests at or above average were interpersonal relationships, nature, words; below average were interests in mechanics, business, esthetics, science, numbers, and time perspective. The low reading comprehension scores, moreover, confirm the teachers judgment that students were inadequate. To explain achievement on the final survey, the several aptitude and interest scores were examined. Although all correlations were low or moderate, it was clear that intensity of interest in vocations explained achievement in the course to a far greater extent than did any of the aptitudes, including reading ability. While the data obtained could not be said to explain all achievement in IV, they nevertheless provide clues to the importance of initial vocational interests in attaining the goals of the course. Team teaching, contrary to the hypothesis, was not observed to influence the achievement test scores any more so than did the individual approach. Size of school, moreover, was also not found to be related to scores on the achievement test.

To study the subjective factors associated with vocational interests, the My Career inventory was administered to control and IV group in September and

again in April. Few differences appeared between the two groups and between administrations. The category most frequently chosen was professional; next, technical; next, operative; next, clerk; next, service; next, farm owner; least, merchant. Between administrations, the control group was found to be more consistent. That is more career choices changes in the IV group. The career group to which the IV students switch is the "professional." With respect to the training requirements for the career, there appeared to be few differences between the groups. Most students have general and relevant information about their choices. Next to be considered was the maturity of reasons for selecting a career, there was a slight, but statistically significant tendency for the IV group to give more mature reasons for selecting their careers. Although many of the reasons for both groups were similar, the IV group gave more reasons for entering a career that were related to inherent features of the job. The IV group cited "personality" as the most important trait necessary for their chosen career. "Personality" was also cited as the major trait necessary but absent. The IV group, in addition, was more aware of dangers inherent in the job. The maturity of explanations of dangers was found to be greater in the IV group. Career choices were discussed most often with members of the family. The IV group tended more to discuss their plans with teachers and counselors than did the control group. The IV group tended to do more reading about their vocational choices. Finally, the alternative choices were compared with original choices after all careers were rescored according to Roe's system of classification. The IV group was observed to select alternative choices of the same level of responsibility; whereas, the control group selected alternative choices of different levels of responsibility. In addition, more IV students selected the same field of interest. This was observed less often in the control group.

Some common factor was believed to account for the judgments of earnings, openings, mental ability requirements, and prestige of the careers. This was determined on the basis of rankings of these attributes on the Business Information Survey. Receiving the lowest rankings on these attributes were the service careers, moderate rankings were received by the clerk and operatives, higher by the technicians, and the highest by the professions.

It had been hypothesized that the IV group would become more realistic in the perception of the several attributes of the world of work. Five of these attributes were examined in the BIS. The differences between the IV and control group both at the beginning and end of the academic year were generally negligible, making such hypothesizing untenable. The career entry plans for the IV group was

more closely to the perception of job openings than those of the control group. Although the hypotheses concerning the added perspective of the IV were not substantiated, several observations were made which add to our understanding to the prevocational behavior of adolescents. The ninth graders understood fairly well what were the relative positions of the several careers with respect to earnings, job openings, and mental ability requirements for careers. Their grasp of the ordering of the careers according to prestige was fair. The number of people employed in the several careers was not known to them. The subjective element in judging the attributes of the several careers was quite apparent in both groups, although more obvious in the IV. The judgments about the number employed, job openings, and prestige were more closely related to personal plans for entering the careers than they were for the actual ordinal arrangements of the careers with respect to these attributes. Judgments of earnings and mental ability requirements were found to be more closely related to the correct ordinal arrangements of the careers. IV students, then, not only perceive the attributes of the world of work more in light of their own plans than of the objective reality, but they perceive them subjectively to a far greater degree than do the control students.

The IV students heartily endorsed the course. They recommended that all students be permitted to take it. When asked what they learned in the course which they could not learn elsewhere, they cited the several types of occupational information. To them the advantages of the course was the learning about jobs and finding out what were their vocational aspirations. Few activities were disliked by the students.

The writer recommends a sharpening of the instructional approaches, emphasizing student self discovery, teaching relevant note taking, taking more field trips and assigning basic texts. Greater financial support is necessary. As important as this is, though, of far greater urgency is for the teachers to know how their students perceive their own vocational choices, interests, and aptitudes. Relating these to the educational requirements and employment openings in these careers is the zenith of the course.

Although some hypotheses were found tenable, most could not be accepted on the basis of data obtained. Yet this research has spawned several suggestions for revising the approaches to the IV class. In addition, several new facets of the prevocational behavior of adolescents were uncovered.

BUSINESS INFORMATION SURVEY

Name _____ School _____

Directions: Below are seven major types of businesses found in the United States. We are trying to find out how much information students have about each. Notice that there is a code for each. In answering the questions write the code letters in the appropriate place below in order from least to most:

Code	Career	Examples
C	Clerk or salesman	Secretary, store clerk, salesman
F	Farm owner	Farm owner
L	Laborer, service	Farm worker, servant, soldier
M	Merchant	Owner of market, store, factory
O	Operator	Truck driver, welder, beautician
P	Professional	Doctor, dentist, lawyer, teacher, nurse
T	Technician	Plumber, painter, carpenter, baker

Sample:

The Business I plan to Enter:

1. Least 1 _____
2 _____
3 _____
4 _____
5 _____
6 _____
Most 7 _____

Earnings of Business:

2. Least 1 F
2 L
3 O
4 C
5 T
6 M
Most 7 P

3. Number People in Business:

Least 1 F
2 L
3 P
4 M
5 O
6 C
Most 7 T

4. Future Job Openings:

	M	F
Least 1	L	L
2	F	F
3	C	O
4	P	M
5	M	P
6	O	T
Most 7	T	C

5. Mental Ability Requirements of Business:

Least 1 L
2 F
3 O
4 T
5 C
6 M
Most 7 P

6. Businesses of Honor, Prestige, Respect:

Least 1 L
2 O
3 C
4 T
5 M
6 F
Most 7 P

MY CAREER

Name_____ School_____

DIRECTIONS: Below are questions about the kind of business you would like to have as an adult. Please answer the questions below.

1. I wish I could become a _____(Name the business)

   because:
   1.

   2.

   3.

2. The kind of schooling and training I would need is:

3. This business requires: (a) the following traits I have:

   as well as (b) the following traits I do not have:

4. Some of the joys I expect in this work are:

5. Some of the dangers I will have to watch out for in this work are:

6. So far I have discussed my choice of a career with the following people:

7. So far I have done the following to learn more about my career choice:

8. If for some reason I am unable to enter this business, I will:

SCORING KEY FOR MY CAREER

Line 1	Score	Classification of Careers: Question 1	Examples
	0	No response	
	1	Clerk or salesman	Secretary, store clerk, Salesman
	2	Farm owner	Farm owner; ranch owner
	3	Laborer, servant	Farm worker, handy man, servant, policeman, soldier, bricklayer
	4	Merchant	Owner of market, owner of furniture store, owner of factory
	5	Operator	Truck driver, welder, concrete mixer operator, machine operator, beautician, pilot
	6	Professional	Doctor, dentist, lawyer, teacher, engineer, nurse
	7	Technician	Plumber, painter, carpenter, electrician, baker.
	8	I don't know	

Lines 2-5 Ranking by student of this career group on B. I. S.

" in 2 Earnings of business

" in 3 Future job openings

" in 4 Mental ability requirements

" in 5 Prestige

Lines 6, 10, 14 Reason - Structure

0 None

1. Undifferentiated: vague, generalized, referrants not clear

   a. I like it

   b. I enjoy it

   c. I want to do it

   d. I will feel satisfied

   e. It is challenging

   f. It is fun

   g. It is not boring

   h. It is not hard

   i. It is exciting

2. Differentiated: General attribute or correlate cited.
    a. I like being outdoors (or indoors)
    b. It pays well
    c. My father does this
    d. I like to work for others
    e. I like sports
    f. I like to travel
    g. I like to help sick people
    h. I like to play with chemicals
    i. I like to tinker
    j. I like to sew
    k. I like to work with people
    l. I like to plant seeds

3. Differentiated. Specific feature cited
    a. I like to race horses
    b. I like to invent new circuits
    c. I like to pass information on to others
    d. I like to work with motors
    e. I like to combine chemicals
    f. I like to raise cereals, geraniums, tulips

Lines 7-9
11-13
14-16

Content - Reasons

0 None

Predisposing factors

110. Past achievements, abilities, interests
    a. My ability to command
    b. I do it well
    c. I am good with my hands
    d. Does not require college

120. Wishes, beliefs
    a. I believe I will like it
    b. What I want to be
    c. I hope I will be successful
    d. I will see if I will like it

130. National needs: Social or economic
    a. I have a service obligation
    b. War in Vietnam
    c. Someone has to farm
    d. There are few good teachers

Influence

141. Models

a. My father does this

b. My brother is in the Navy

142. Direct: Pressure, coercion

a. My parents are making me

b. My family expects me to

Intrinsic Factors

210. Objects

a. I like animals

b. I like machines

c. I like children

220. Functions and Services: Observable behaviors

a. I like to pass knowledge on to others

b. I like to play music

c. I like to fix peoples hair

230. Correlates

a. I like to be out of doors (indoors)

b. I like to be around books

c. I like to work 12 months of the year

Consequences:

Self enhancement: Individual

311. Security:

312. Status: position in community, power, leadership, fame

313. General emotional: aesthetic

a. Work is enjoyable, exciting

b. Work is satisfying, permits self expression

c. Work is fun, challenging, not boring

314. Autonomy: I like to do things my own way

315. Order: I like to plan my own day

316. Sentience: I like to learn a lot, study, do research

317. Achievement

a. The pay is good

b. Thrill of making things

318. Excitement of discovery: see new places

319. Satisfaction with simple work - nontaxing, avoidance of responsibility, citation of abundant leisure.

Self enhancement: Social

321. Affiliation

a. I like to work with children

b. I like to be with people

322. Service, mediation

a. I like to help children learn

b. I like to help sick people

c. Relief of pain in patients

d. Watching my students succeed

323. Benefit to humanity: conquer disease, invention

Kind of Schooling

General:

Line 17 — 1 Seven years of college

2. Specific: Four years of liberal arts; 3 years of dentistry

Line 18 — 1. Relevant

a. Lawyer - 3-4 years of law school

b. Pharmacist - 4-5 years of pharmacy school

2. Irrelevant

a. Electrician - none

b. Plumber - four years of college

Lines 19 and 20 — Traits - present

10 Work habits

a. Dependability, persistence

b. Productivity, planning

20 Personality

a. Adaptability, tact, cooperativeness

b. Self control, confidence

c. Understanding of others

30 Work interests and satisfactions

a. Love of money

b. Like to travel

c. Like to be with children

d. Enjoy experimentation

40 Character

a. Sincerity

b. Honesty

50 Ability: General

51 Leadership

52 Communication: writing, speaking

53 Manual, mechanical

54 Organization

60 Physical

a. Vision

b. Hearing

70 Objectively unrelated to question

71 Training

72 Knowledge or experience

73 Sex

74 Race

75 Age

80 I don't know

90 No response

Lines 21, 22 Traits not present

Scoring system the same as for those present

Lines 23-25 Joys

Score the same as for consequences under reasons

Line 26 <u>Dangers</u>

0 No response

1. Natural

a. Flood

b. High winds

2. Inherent in job - not directly related to service

a. Competition - economic

b. Automation

c. Short contract

d. Low salary

3. Inherent in job performance

a. Handling insecticides

b. Handling bare wires

c. Writer's cramp

4. Inherent in Self: Inadequacy

a. Poor example

b. Impatience

c. Misleading others

Line 27 Score dangers for structure

5. Inherent in social climate
   a. Fear of failure
   b. Poor impression
   c. Rejection because of race, sex, age, religion
6. I don't know
7. No danger

Line 28 Discussed plans with

1 Family
2 Friends
3 Teachers
4 Guidance Counselor
5 Someone in career
6 Name of unclassified acquaintance
7 No one
8 Irrelevant

CONFERENCE QUESTIONS

Teacher _____ School _____ Date _____

1. How many students do you have in your class? _____

2. Do you find the size of your class to be feasible for teaching a course of this nature?
   a. Advantages of size
   b. Disadvantages of size

3. How were the students selected for this course?

4. How many field trips have you taken? _____
   a. What was the nature of it?
   b. Outcome:
      1. *Stimulate questions or research?*
      2. Any follow-up? Describe
      3. As you look back, can you think of anything that might have made the trip more effective?

5. What percentage of your classroom time is spent with:
   a. Textbook _____
   b. Lecture _____
   c. Projects Research _____
   d. Field trips _____
   e. Reports _____
   f. Visual aids _____
   g. Supplementary reading material _____

6. How do you feel about the adequacy of your instructional material?

7. What are some of the major problems you have encountered or anticipate?

8. What recommendations could you make?

9. How would you evaluate the response to this program?

	Favorable	Unfavorable
a. Administration	( )	( )
b. Parents	( )	( )
c. Teachers	( )	( )
d. Students (elaborate)	( )	( )

Questionnaire - I.V. Teachers

The I.V. course is about ten months old. You are now in a position to give us some information which will help us plan next year's program. Prompt return of this questionnaire will be appreciated. Thank you. Use additional sheets if necessary.

1. Name the texts you used, tell if they were distributed to students, and state how many weeks you used them.

Text	Given to Students	Length of Use
1.		
2.		
3.		
4.		
5.		

2. What were the best films you used?

Film	Company	Purpose
1.		
2.		
3.		
4.		
5.		

3. What field trips did you take?

1.

2.

3.

4.

5.

4. What topics did visiting speakers cover?

1.

2.

3.

4.

5.

5. How much did the following help achieve course goals?

Activity	Very Little	Much	Immense
Teacher lecture			
Student reports			
Films			
Field Trips			
Visiting Speakers			
Group Projects			
Shop Work			
Community Survey			
Job Survey			
Self Study			
Student Diary			
Correlation with Subject Matter			

6. What phases of the course would you delete next year?

7. What is not being taught that should be included next year?

8. What program should be provided next year for this year's I.V. students?

FINAL SURVEY - I.V. STUDENTS 1963-1964

PART I

DIRECTIONS: Below are 69 questions which may be answered TRUE or FALSE. Make no marks on the paper other than an X in either T or F columns.

T	F		
(90)	(30)	1.	A worker is more apt to be fired because he is hard to get along with than because he is unskilled.
(26)	(74)	2.	Most employers are more interested in an applicant's appearance than in his school record.
(89)	(11)	3.	It is easier to develop an interest in typewriting by typing yourself than it is by reading a story about typists.
(62)	(38)	4.	A good worker will find nothing boring in his job.
(53)	(47)	5.	Although there are no right and wrong answers to ability tests there are right answers for interest tests.
(19)	(81)	6.	An adult's vocational interests change very little from those he held as a third grader.
(91)	(9)	7.	A person interested in using tools should probably become a forest ranger.
(84)	(16)	8.	A hobby, like sewing or working on cars, helps release one from everyday worries and tensions.
(58)	(42)	9.	If someone receives occupational therapy in a hospital, this means he is given an opportunity to get better by drawing, painting, weaving, or making things.
(62)	(38)	10.	A hobby such as chemistry might prepare you for a job in professional or mechanical work but not in the general clerical field.
(54)	(46)	11.	Although homemaking is a career for many women it is not listed in the Dictionary of Occupational Titles.

(57) (43) 12. Women working in the same occupations as men tend to be paid the same wages.

(44) (56) 13. Today, very few assembly line workers have a single task which they routinely perform on the job.

(36) (64) 14. Today, most workers can be trained for an occupation and never need any retraining.

(74) (26) 15. Throughout the United States, more people are graduating from high school than ever before.

(93) (7) 16. Schools are beginning to adopt supervised work experience programs to keep possible dropouts in school.

(79) (21) 17. For information about public vocational schools it is better to write the Director of Vocational Education at the Department of Public Instruction in North Carolina than to write the Superintendent of Public Instruction.

(81) (19) 18. Technical schools have been developed in answer to the need of industry for nonprofessional workers with training beyond high school.

(81) (19) 19. Factors most often considered in accepting a student for college are aptitude scores and achievement in high school.

(67) (33) 20. Apprentices for most crafts require about 52 weeks of training.

(60) (40) 21. An apprentice averages close to 75 per cent of the skilled worker's pay during the period of his apprenticeship.

(69) (31) 22. For every three months of on the job training, an apprentice spends one week in class.

(60) (40) 23. The first job held by a high school graduate is more apt to have been obtained through Employment Security than through friends and relatives.

(77) (23) 24. A student will accept a job only if he can make $50 per 40-hour week. He is offered $1.25 per hour. Will he accept it?

(18) (82) 25. The profession with the largest number of workers is dentistry.

(44) (56) 26. There is a much greater demand for elementary school teachers than for high school teachers.

(92) (8) 27. There are jobs available for lawyers in private practice, government, and business corporations.

(80) (20) 28. A Certified Public Accountant must demonstrate competence to a State examining official before he may use the title.

(11) (89) 29. A draftsman should be able to draw but does not have to know much about math or science.

(60) (40) 30. The tree surgeon does not have to climb trees but should know how to graft.

(65) (35) 31. About one in three grocery stores fail each year.

(92) (8) 32. To operate businesses, the managers are generally required to obtain licenses or permits.

(60) (40) 33. Most, but not all slaughtered meats are inspected by a Federal agent who stamps his acceptance on the meat.

(50) (50) 34. Filing clerks need little direct training but they should be accurate readers.

(57) (43) 35. The duties of most secretaries are limited to typing and dictation.

(88) (12) 36. Today there are machines which translate little holes on an IBM card into words, including the balance due on accounts.

(83) (17) 37. One reason why fewer homes employ maids today is that appliances can do their jobs with utmost speed.

(26) (74) 38. Practical nurses no special training.

(88) (12) 39. The United States Government has undertaken to teach members of the armed forces a trade as well as the skills of war.

(48) (52) 40. A city boy studying biology is more apt to become a farmer than a boy whose father farms.

(36) (64) 41. To be known as a dairy farmer, no wheat, cotton, or tobacco may be grown.

(57) (43) 42. Sons of fishermen are more likely to become fishermen than any other youngsters.

(38) (62) 43. There are more mechanics and repairmen than there are carpenters, electricians, and plumbers combined.

(57) (43) 44. There are almost as many men in the crafts as there are women.

(66) (34) 45. A tool and die maker could develop the dies for forging automobile fenders.

(47) (53) 46. In the building trades there are more carpenters employed than electricians, plumbers, and brickmasons combined.

(60) (40) 47. A finish carpenter builds wooden structures, erects scaffolds, and lays sub-floors.

(30) (70) 48. In most cities, it is not necessary for a plumber to have a license.

(77) (23) 49. Operators may be found in cigarette, paper, metal, leather and textile industries.

(80) (20) 50. Labor organizations were formed to improve worker conditions and wages by bargaining with management.

(54) (46) 51. A strike is the laborer's way of getting even with the bosses when they treat him badly.

(49) (51) 52. A closed shop refers to the fact that only non-union members are allowed to work there.

(87) (13) 53. If a worker is injured on the job, whether it is due to his own carelessness or the negligence of his boss, he is entitled to money benefits.

(92) (8) 54. If a worker who has been paying Social Security should die, monthly checks are sent to his widow and children.

(70) (30) 55. The Taft-Hartley Act prohibited the closed shop and required unions to file financial statements.

(72) (28) 56. Civil Service operates in this way. Someone wants to work for the government. He meets whatever requirements are set up for the job. His name is then placed on Civil Service list. Finally, he is recommended by his local congressmen.

(37) (63) 57. The Federal Bureau of Investigation is the only police force operated by the Federal Government.

(55) (45) 58. A rural postal delivery man who has a six mile route in which to deliver his mailwill receive a lower pay check than one who has a fifty mile route.

(76) (24) 59. A person may become a part owner of a business corporation by buying stock. Such a person, however, is not responsible for selling any products.

(82) (18) 60. A personnel department will, on the basis of tests and interviews, choose applicants for positions in a company.

(64) (36) 61. Mass production refers to the fact that each worker performs the same one job in turning out a product.

(29) (71) 62. Employers in the textile industry have no preference for younger workers.

(74) (26) 63. Economic conditions today are such that if one is trained for a trade, there is a good chance he will be retrained for that or some other job several times in his life.

(42) (52) 64. A supervisor rating a worker on dexterity and manipulation is probably rating his physical strength.

(70) (30) 65. Should you be rated on industry, you are being rated on how well you apply yourself.

(57) (43) 66. You will be rated on productivity. This means how thorough you are.

(76) (24) 67. If you prefer filing letters to repairing motors this is known as clerical ability.

(77) (23) 68. If you file letters two times as fast as your neighbor, we would say you have greater clerical skill.

(49) (51) 69. More people are employed as operatives than in any other type of work.

*DISTRIBUTIVE EDUCATION; *TEACHER ROLE; *TEACHER EDUCATORS; CONSULTATION SERVICES; *TEACHER RESPONSIBILITY; INSERVICE TEACHING; NATIONAL SURVEYS; QUESTIONNAIRES; DISTRIBUTIVE EDUCATION TEACHERS

Off-campus services typically offered by distributive education teacher-educators are described. Questionnaires were returned by 32 of the 34 distributive education teacher-educators contacted in 26 states. Replies of the 23 respondents from 16 states engaged primarily in a teacher-educator function were used for the report. The results included: (1) The median allocation of work load was 42.3 percent for teacher education, 27 percent for off-campus activities, 18.2 percent for on-campus administrtion duties, and 12.5 percent for other activities, (2) The average teacher-educator taught 8 credit hours per week, (3) Over 80 percent of the teacher-educators had reduced campus loads to offset off-campus activities, (4) Over half 52.2 percent, offered professional courses for credit off the main campus, mostly as needs in the area arose, (5) Over 90 percent scheduled individual visits with their coordinators, (6) 91.3 percent had a planned program of inservice education, (7) 95.6 percent visited local schools for consultation about starting distributive education programs, (8) 73.9 percent had responsibility for campus student teachers, (9) 69.5 percent assisted in checking state high school program effectiveness, and (10) 95.6 percent were involved in planning their state coordinator conference. Comments of the respondents, the questionnaire with summary data, and a list of participants are included. (MM)

OFF-CAMPUS RESPONSIBILITIES OF DISTRIBUTIVE TEACHER-EDUCATORS.

CDTE Study Number 4

Edward E. Scannell
Distributive Education Services
Cedar Falls, Iowa

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE
OFFICE OF EDUCATION

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

FOREWORD

The Council for Distributive Teacher Education was organized in 1961. Membership in the organization consists of teacher-educators and other distributive education personnel with an interest in advancing distributive teacher education. CDTE has as one of its primary interests research and publication. Hence, the emphasis upon this the fourth CDTE research report.

Mr. Scannell was chosen to direct this study because of his particular professional interest and competence in adult education and field services. He has done a thorough, careful piece of work and deserves the gratitude of all members of CDTE.

This report was edited by the president of the organization and published through the courtesy of the State College of Iowa. Requests for copies from non-members should be addressed to Mr. Scannell.

INTRODUCTION

In Distributive Education, the two words "Teacher-Educator" carry special significance. His position is both unique and challenging: unique in the sense that the influence of his teaching knows no geographic boundaries; challenging in the sense that his professional responsibilities extend throughout his state to every local distributive education program. While other instructors on his campus may feel that with graduation, their work with former students is finished, the distributive teacher-educator realizes that is actually only the beginning. The "teacher-student" relationship on the campus transforms into a "teacher-teacher" relationship and close harmony and communication with his coordinators and other distributive education personnel in the field is the result.

Obviously, this professional liason assumes a close personal contact with recent graduates as well as seasoned coordinators. This in turn, necessitates the teacher-educators leaving the campus frequently in providing a continuous program of in-service education for his state's distributive education coordinators.

While the size and scope of these off-campus responsibilities may vary with the particular institution involved, there is enough similarity in purpose to note some commonly undertaken duties and to determine the types of off-campus services typically offered.

To define and describe these activities is precisely the purpose of this paper.

THE PROBLEM

While it is recognized that distributive teacher-educators must spend some time away from the campus, little information is available to show just how much time this typically involves nor the actual kinds of activities carried out. Questions occasionally arise about the sphere of operations off-campus that surround the work of a teacher-educator. These questions may concern the teacher-educator himself, or the administration of his college who must budget time and staff. Further, these items are also of concern for the state supervisory staff.

Some of these inquiries might include:

1. How should a college or university considering the addition of a teacher-educator for distributive education apportion his teaching schedule to allow for the off-campus work so vital for an effective program?

2. What types of professional credit classes should be offered away from the campus?

3. What shall be offered in terms of in-service education?

4. How often do present teacher-educators meet with their coordinators?

5. What kinds of consultation services do teacher-educators perform?

While the material presented herein reflects primarily the existing situation across the land, it should prove useful in answering the above questions as well as any others incidental to the off-campus activities of teacher-educators.

THE PROCEDURE

The proposed questionnaire which was to have been used in the study was pre-tested by a group of teacher-educators attending a sub-regional North Central Distributive Education Conference held at the State College of Iowa in the fall of 1962. The group was asked to comment critically on the questionnaire and to suggest revisions as to its improvement. An informal meeting was also held at that time with Dr. Peter G. Haines, President of the Council for Distributive Teacher Education and Professor Fairchild Carter of Indiana University. The

meeting was for the purpose of coordinating this study with one undertaken by Professor Carter concerning the teacher-educator's role in Adult Distributive Education. It was decided then, by mutual agreement, to delete some items from the writer's questionnaire in order to avoid duplication of effort between the two CDTE studies and to alleviate any possibility of repetitious questions on the two projects. Finally, the suggestions coming from the pretest were incorporated in the finalized questionnaire used in this report.

The questionnaire along with a cover letter was sent to all active members of the Council for Distributive Teacher Education. To ensure the inclusion of all teacher-educators, this list was checked against the Directory of Teacher-Educators of Distributive Education distributed by the Distributive Education Branch, United States Office of Education. As a final check, the CDTE list of associate members was consulted and any others shown with the title "Teacher-Educator" were included in the study.

Thirty-four questionnaires were mailed out to teacher-educators in twenty-six states. Thirty-two or 94.12% were returned. Several of the returned sheets were accompanied with a note from the sender commenting that the questionnaire was not applicable to their position. A few more were deemed non-usable after an analysis of the information on the return indicated that the respondent was not engaged primarily in a teacher-education function, or that the particular duties shown would not have been representative of the group. This was done in three cases, but only after a check with the teacher-educator at the State College of Iowa for concurrance. Twenty-three replies from sixteen different states were used for the report. (See appendix for list of respondents)

FINDINGS, PART I: GENERAL

The results of the study are presented in this manner: the numerical and alphabetical symbols used in this section correspond to the ones used in the actual questionnaire. For quick reference, the statistical ratings are again indicated on the questionnaire itself. (See appendix) After each question, the writer has summarized the data and made a few comments which are then followed by comments from the respondents. In most cases, these notations of the teacher-educators should prove very beneficial to the reader since they illustrate the variety of ways the several states handle off-campus work.

A. ALLOCATION OF WORK LOAD

In order to arrive at a composite picture of the group's work load, the teacher-educators were asked to show how their time is allocated in the areas of on-campus administration, campus teaching, off-campus activities, and any other duties not covered in these three divisions. The chart below shows the average time spent proportionately by the group.

RELATIVE TIME ALLOCATIONS OF DISTRIBUTIVE TEACHER-EDUCATORS

As the chart illustrates, more than 40% of the "average" respondent's time, or about two days a week, is spent in teaching and other teacher-education activities. Surprising to some might be the fact that over a quarter of his time is devoted to off-campus activities. To lend a sympathetic ear to the often-heard statement of administrative detail, the results show almost 20% of the week's time is spent on administrative matters. An average week would allow this educator a little more than 10% of that period--roughly a half-day's time--for other duties. Typically, this comprises time for research, professional writing, and in a few cases, professional organizations. The duties actually assigned the group of teacher-educators include sponsorship of the State Distributive Education Clubs of America, preparation of promotional and other Distributive Education materials, directing the work of field instructors, guidance, placement, and recruitment. Still others mentioned they have responsibility for the organization and supervision of the campus work-experience program for business education students.

The time expended for on-campus teacher-education ranged from 15% to the high of 100% with 40% the median but 25% the mode. For off-campus activities, another broad range was shown with replies starting at 0% and continuing on up to 80%. The 20% figure was most often cited, and this percentile was also the median.

The on-campus administration division witnessed the same type of variety. With a low of 0%, the respondents ran as high as 75%. The median time was 15%, but an equal number (22.7%) indicated either the 10% or 25% figures.

Of the respondents who gave time to "other" activities, their figures stretched from 5% to 50% with time for research most often mentioned.

The time breakdowns above were interpreted to be on the basis of a regular work week. Admittedly, any assumption by the writer that a

distributive-educator, whether it be on the high school, post high school, college, or adult level, works only an "8 to 5" day is obviously erroneous. Therefore, the time allocations may be subject to a slight measure of inaccuracy since there is no way of knowing how many hours the respondents consider to be a "normal" day!

B. CREDIT HOURS TAUGHT

To get an idea of how many campus classes are conducted by teacher-educators, they were requested to enumerate the number of credit hours taught weekly. Again, a rather wide range was in evidence; one respondent taught an average of three credit hours while others were charged with as many as fourteen. The average distributive teacher-educator, however, teaches a little less than eight credit hours per week. Certainly the amount of time available for off-campus work will be greatly affected by the teaching load on the campus. Although this question might appear inappropriate at first glance, it was used in order to see what provisions are being made in terms of lighter loads so that field activities, etc. might be cared for.

COMMENTS REGARDING TEACHING SCHEDULES:

"Teaching load varies with committee and other assignments."

"Load reduced when assigned to other duties."

"Unofficially, provision is made for off-campus activities, research, and various professional activities."

"The teaching load varies with the amount of off-campus activity required."

"We calculate loads in this order: a standard load is twelve quarter hours. All major activities are calculated on this basis; for example:

Instructor A - 12 hours (4 actual courses)
Instructor B - 12 hours (2 courses plus equal)
Instructor C - 12 hours (no courses but an assignment equivalent for research)"

C. VARIATION OF LOADS BY SEMESTERS

Because of the difference in size of the various teacher-education programs across the land, some instructors may tend to concentrate certain classes in a particular period; thus one quarter (semester) might appear to be lighter than another. In an attempt to offset any such situation showing up in Question B regarding teaching load, the respondents were asked to comment if the teaching schedule did vary to any extent from period to period. A few educators stated that the spring quarter was usually the least heavy, but two others reported that fall is their lightest period. Apparently, the only conclusion to be drawn for those on the quarter system is that winter is not typically recommended for travel!

Of the almost half (47.9%) who indicated any marked difference from semester to semester, there were some significant points explaining the reasons for so doing.

COMMENTS REGARDING SEMESTER CHANGES:

"Spring quarter is light since most graduate courses are offered fall and winter."

"During fall and winter quarters I teach 10-12 quarter hours, but only 6 in the spring."

"All of my off-campus activity duties are carried out during the fall quarter, so I have no teaching load then."

"For fall quarter, the emphasis is on supervision and in-service teacher training--usually no formal campus classes."

D. FACULTY CREDIT-HOUR LOADS

The object of asking the respondents to state the average faculty credit-hour load for their campus was to determine what ratios exist between other faculty members and distributive teacher-educators. It

follows, of course, that to provide for a well-balanced off-campus program, the distributive teacher-educator should be given a reduced campus load. Happily, in over 80% of the colleges and universities, this is the actual case. The ratios range as high as 4:1 for one teacher-educator to 1:1 for three others. When individually compared to other faculty members, exactly half of the teacher-educator group teach a half-load or less.

The average, however, for all teacher-educators shows 7.66 hours of teaching fortho D. E. faculty as compared to 13.00 for other faculty members.

FINDINGS, PART II: PROFESSIONAL OFF-CAMPUS ACTIVITIES

A. TIME ALLOWED FOR OFF-CAMPUS DUTIES

Turning now to the time devoted for all off-campus duties, the group reported the approximate number of days they try and set aside weekly for these activities. The largest single group (43.5%) try to schedule one day a week; 13.1% usually spend two days a week in the field; and 21.7% allow three days a week for off-campus functions. The remainder have no definite times set aside for field work, and vary considerably in the actual number of days in any given week.

Because the respondents spending the three days weekly off-campus tended to have fewer campus classes than the majority of the respondents, their comments are presented separately.

COMMENTS REGARDING NUMBER OF DAYS ALLOWED FOR OFF-CAMPUS DUTIES:

1. Respondents spending three days off-campus.

"I also serve as area coordinator."

"I supervise 23 high school D. E. programs; also some adult classes at night."

"Due to in-service teacher-training and teaching adult D. E. extension classes."

"Responsible for supervision and promotion of Coop Program."

2. Respondents spending none, one, or two days off-campus.

"Varies depending on time of year, but overall average would be about two days a week. When seniors are away from classes, I do much off-campus work."

"This (one day) is an average. When I go to the southern part of the state, it's a week at a time."

"This time varies, due to need, from no days per week to six days."

"Take time as necessary, but it averages one and one-half days per week including professional conferences and association meetings."

"I don't "allow" any. I take it as it comes with no planned schedule."

"No definite schedule."

"One day weekly to teach an extramural class."

"No specific off-campus duties assigned. However, I participate occasionally in the following off-campus activities: Supervision of student teaching, consultation with coordinators and administrators, talks to various groups, teach adult evening courses, etc. I cooperate with the state supervisor in numerous activities upon request."

"Tends to run more than one day a week; however, if professional meetings were included time would be two days a week."

"We handle most off-campus duties while the seniors are off-campus, six weeks in fall, six weeks in winter."

B. CREDIT CLASSES

Just over half (52.2%) of the respondents offer professional courses for credit in areas away from the main campus. There appears to be little consistency, however, in the frequency of offering the off-campus classes. Only two schools teach these each semester while two others offer them each year. Half of the institutions offering off-campus classes do so as the need arises. Certainly this would vary greatly from state to state depending on the professional educational status of coordinators, state plan requirements, and perhaps proximity of the present D. E. or other Vocational Education Programs.

COMMENTS:

"We offer one course, usually second semester."

"During the past seven years, we have had an off-campus course every year."

"This (off-campus class work) hasn't been done for several years. When distributive teacher-education was new, we conducted extension classes. Now, our local personnel are completely certified and it is not economically justifiable. Nearly 100% of our new teachers have completed the undergraduate D. E. major. About 75% then return for Master Degree work in the summer."

"We have a regular schedule around the state in our extension centers, but also schedule extra courses when a group requests them."

1. Institutions offering off-campus classes were asked to identify the classes taught in the past two years and to state the approximate enrollment and distance away from the campus. The courses named and number of times offered are:

Organization and Administration of Distributive Education	4
Coordination Methods	3
Principles of Vocational Education	2
Salesmanship Methods	1
Directed Study Reading	1
Renewal of Occupational Experience	1
Methods in Distributive Subjects	1
Seminars in Distributive Education	1
Problems in Cooperative Business Education	1
Human Relations and Supervisory Training	1

One teacher-educator offered three classes--each was taught about 100 miles from his campus. Another carried his teaching chores 130 miles from "home base." In terms of class enrollment, numbers ranged from 18-40. A few of the teacher-educators mentioned that these off-campus classes include other business education teachers as well as any other vocational education teacher. One respondent wrote, "If only D. E. people enrolled, the class would be too small to offer."

2. Of the teacher-educators who teach extension classes, one-third are paid extra for their efforts. Most, however, commented that this was part of their regular duties.

3. Only three institutions of the twelve offering professional extension courses charge the students a higher tuition fee. Eight colleges and universities keep their fees constant while one attaches a smaller fee for extension classes.

COMMENTS:

"I can work off-duty hours and teach business subjects."

"Could be, (paid additionally) if not designated as a part of base load."

"Rate (extra compensation) is lower than regular appointment rate. Travel is reimbursed."

"Although some of our staff members are paid extra, mine has always been part of my load."

"This (off-campus teaching) is considered part of teacher-educator's regular duties."

"One three-credit course per year is paid on an overload basis if the professor has a full load on campus. Otherwise, the extension course is counted as part of his load."

C. VISITATION TO COORDINATORS:

Over 90% of the respondents schedule individual visitations to their coordinators. Since the time involved with these visits would vary, of

course, with the number of programs in a state, it is highly encouraging to see such importance stressed to maintaining this close relationship. Two-thirds of the teacher-educators visit their new coordinators at least once during the academic year. Over a fourth (28.8%) visit all coordinators each year and over half make visitations when requested by the schools. One respondent mentioned he schedules visits only to his own former students unless so requested by the others.

COMMENTS

"I visit new grads in the metropolitan area. Also visit schools where I have student teachers."

"During first school semester, new coordinators are visited weekly; second semester at least once a month plus on-campus office conferences. Programs having experienced and good coordinators are visited every 6-8 weeks. (Respondent spends 65% of time off-campus.)"

"Classroom visitations are shared with an assistant state supervisor."

"I visit coordinators also when requested by state supervisors for evaluation purposes."

"I try to visit each new coordinator and observe their DE class early in the fall. Several schools request this service as do some of our "older" programs."

"I sometimes visit first year teaching, but this function is the sole responsibility of the state supervisor of our state."

"I'll also visit them when I wish to learn something myself, such as seeing a new lab."

"Although I don't schedule individual conferences, I do go occasionally on request or because of my own curiosity."

D. IN-SERVICE EDUCATION

When asked about a planned program of in-service education, the group again presented an extremely good case with 91.3% of the returns answering in the affirmative. The group or area meeting seems to be the most commonly used approach by the teacher-educator. Not quite half (42.1%) conduct these meetings once a year. Two of the nineteen educators hold

them semi-annually while two others meet with their coordinators on a regular monthly basis. Six (31.9%) hold these meetings as the need becomes apparent, and one meets on request of his group.

A close second rating for popularity goes to the workshop on campus. Seventeen of the twenty-one affirmative responses stated they offer these workshops;eleven (64.7%) offer them every year while the other six provide for them as the need arises.

In-service training through individual consultations with coordinators are planned by 64.7% of the respondents. All but two of these are held as need arises.

COMMENTS REGARDING IN-SERVICE WORK

"Group meetings are held in cooperation with state supervisor."

"I checked "Yes," but it depends on meaning of "planned." We have no set number of visits, meetings, etc. However, we do plan extension courses to cover each area of the state. We also have independent study courses for coordination on the job."

"For the past several years workshops have been held on campus under the supervision of the Bureau of Business and Distributive Education, State Education Department. I have always served as a consultant at these workshops at the request of the State Supervisor and Chief of the Bureau of Business and Distributive Education."

"The coordinators usually meet as a group about three times a year. Since DECA is 100% in my state, all coordinators are together for the Delegate Assembly and the State Leadership Conference, so there is ample time for meetings. We have a formal coordinators workshop each fall too."

"We meet annually in connection with the State Vocational Association convention."

"We also have an annual conference."

"We usually have two or three visiting consultants in the technical and professional content areas. These may be business personnel or from the field of business. Coordinators contribute suggestions to a workshop planning committee."

E. SCHOOL CONSULTATIVE SERVICES

An overwhelming majority (95.6%) of the respondents visit local schools for consultation about starting D. E. programs. Twenty-two of the twenty-three teacher-educators assist the schools in this manner. The twenty-third actually may make an occasional visit but stated that this is usually the area supervisor's job. Several made the comment that the consultation service is usually rendered by the state supervisor, but they have done it at the supervisor's request.

F. SUPERVISION OF STUDENT TEACHING

About three-fourths (73.9%) have responsibility for off-campus student-teachers in distributive education. These duties range from a one-time observation to complete responsibility for placement and for preparation of supervisory coordinators. While six respondents said they have no direct responsibility, they do maintain contact by an occasional visit or request written report.

COMMENTS REGARDING STUDENT-TEACHING INVOLVEMENT:

"We take care of placement and pay two supervisory visits."

"The D. E. majors are my advisees and I recommend these locations for student teaching. I have responsibility for supervising the experience."

"Visit local schools for observation of teaching; conferences with supervisory coordinators, grading, etc."

"I am their major advisor. I visit them six times during the quarter and meet with them in seminars."

"(My duties are) making arrangements for placement, to prepare supervisory coordinators, to visit during period of practice teaching and to evaluate performance."

"To observe at least twice; other meetings with critic teacher."

"Visit practice-teacher three times a semester."

"I visit each one twice and more often if necessary. Methods class and student teaching are coordinated."

"I assist the Education Department with supervising students."

"This (supervision) is under a separate department, but I will also visit and supervise them."

"This (supervision) is the function of our resident student-teaching coordinator in each center."

G. EVALUATION ACTIVITIES

Sixteen (69.5%) of the respondents do assist in checking the effectiveness of their state high school programs. Predominantly, this is done only at the request of the school and/or the state supervisor. While it is commonly accepted that evaluation is primarily a supervisory function of the state staff, it is encouraging to note the high degree of cooperation between the state supervisor and his teacher-educator. Obviously, this teamwork is essential and these results strengthen that belief.

COMMENTS:

"Request may initiate with the state supervisor, but we must have an invitation from the school."

"Constant evaluation is the purpose of supervisory visit."

"I checked "no" since we make no formal evaluation. Of course, some requests come in to help us look at (some phase of program such as instructional materials)."

"We are maintaining a system of planned professional evaluations of one or two programs each year."

"All schools are evaluated once a year."

"Evaluation is not really a function. The staff reports items of note to the D. E. Supervisor."

"Because of the heavy student load, I have not been requested to render this service, but our department would accept the assignment if requested to do so."

"The State Supervisor and I work this out together. My evaluation is largely concerned with classroom instruction and the "educational soundness" of the total experience of the D. E. Student. The State Supervisor deals more with administrative problems, coordination problems, etc. We both are alert to-and aware of-the total program evaluation in our visits and are quick to alert the other if we see a weakness in any part of the total program."

H. PLANNED STATEWIDE EVALUATION

The respondents were almost evenly split in regard to planned periodic evaluation, twelve (52.1%) replied affirmatively while eleven (47.9%) don't have actual scheduled evaluations as such. Though a state may not have a rigid formalized plan, most all use many of the evaluative tools at their disposal with a good deal of frequency.

COMMENTS:

"School visitations are out of the State Board Office."

"This is our State Supervisor's responsibility. Regular visits and annual reports are required from the schools."

"We cooperate with the State Supervisor on this."

"Our State Supervisor does this annually."

"Each new program is evaluated at the end of the first year--after that every two years by the State Supervisor."

"Evaluations are not periodic, but held as needed."

"Not planned, but we have self-evaluations, and others if requested by the school or State Supervisor."

I. COORDINATORS CONFERENCE

Finally then, the respondents were asked to indicate their duties included with their state's coordinators conference. Again, almost an unanimous answer in the affirmative resounded with 95.6% checking "yes." The largest area of involvement is in the planning stages with twenty of the twenty-two replies indicating this function. Consultation duties ranked second with 81.8% mentioning this item, while 59.1% were frequently called upon as a resource person or guest speaker. Other areas involved general cooperation with state staff in all phases of the conference and other administration assistance.

COMMENTS

"Other duties may involve hospitality to special guests, preparation of materials, and training of those involved phases of the program."

"Duties differ each year, but always involved in planning."

"The supervisor directs--we perform staff functions."

"I cooperate with the state staff and our coordinators association in numerous ways."

"The teacher-trainers always assist in planning, but the final decisions are made by a committee of coordinators."

"This conference is held on campus every other year."

"I have full responsibility working with a committee composed of coordinators, state supervisor, and area supervisor."

"We have a two and one-half day statewide meeting in August and a one day area meeting in the spring. The state supervisor, teacher-educator, and every committee of the coordination association plan these meetings jointly."

CONCLUSION

The preceding pages confirm the fact that, on the whole, the nation's distributive teacher-educators are doing well in the needed and vital aspect of field services. Some of the figures look impressive and might even lead one to believe that little more could be done in this area. Complacency, however, is unwarranted. Although this study presents a healthy overview of the many off-campus activities performed, the critical reader will be quick to point out that there is still much to be done.

Some of the more apparent observations might well center around these items:

1. A few institutions must still be convinced that teacher-educators have a good case for reduced teaching loads. The many responsibilities that are all considered as "part of the job" attest to that.

2. As the number of teacher-coordinators increase annually, there might be need for more credit classes offered away from the main campus. Any such need, of course, can best be perceived by the teacher-educator.

3. The problem of communication is always a pressing one. The field activities of state supervisor and teacher-educator might be better coordinated. The reciprocal exchange of monthly reports to show planned visitations has much to recommend its use.

4. The further development of a meaningful in-service education program bears study. New coordinators especially need the constant help and guidance of a teacher-education staff.

5. Finally, the matter of program evaluation warrants comment. It would seem the responsibility for this should be shared by the teacher-educator and state supervisor. Joint visitations to each school would allow this evaluation team to appraise the respective parts of the program. This would be in addition to regular visitations even though evaluation is always essentially a part of these visits.

The enumeration of these few points by no means limits the items of concern. But no matter how long the list, mutual effort and mutual planning that is characteristic of most programs can easily overcome any minor problems. It is this type of cooperation that has enabled distributive education to enjoy the status it now holds.

SUMMARY

The importance of off-campus activities in teacher education work is well recognized. In their "Proposal of Minimum Standards for the Approval of Teacher Preparing Institutions," the National Association of State Directors of Teacher Education and Certification listed "Field Services" as an essential ingredient for an effective program.

The emphasis placed on off-campus activities by distributive teacher-educators is brought out in this study. In addition to instructional chores on campus, three-fourths of the group surveyed plan at least one day weekly in the field for several varied, yet related duties. In-service training either through regular extension classes, or through individual and group meetings, is offered by most institutions. Two-thirds of the nation's distributive teacher-educators visit new coordinators in their state every year. Several states provide individual visitations for experienced coordinators as well.

Other field services made available by teacher-educators include consultative and evaluative assistance for high schools and post high schools. The cooperation between the state supervisor and teacher-educator so necessary for the efficient operation of a statewide program is manifested in the close unity of purpose shared by this team.

To be sure, the high school coordinator is rightfully called the key to a strong distributive education program. It would seem to follow then, that the teacher-educator is the locksmith, for in his hands lies the responsibility for molding and holding good coordinators. These two, working together, can open any door to the ever-growing opportunities in the total program of distributive education.

Appendix #1: Sample Letter

Dr. William B. Logan
Director of Distributive Education
Ohio State University
1988 College Road
Columbus 10, Ohio

Dear Dr. Logan:

During the Council for Distributive Teacher Education meetings at the last AVA convention, several ideas were presented for the group's study and research. No doubt you are familiar with the first two of these research projects undertaken by Reno Knouse and Eugene Door published as CDTE Professional Bulletin Series Numbers 1 and 2.

Another area suggested for study concerns the off-campus activities of Distributive Teacher-Educators. It is here that we need your help. May we ask for a few minutes of your time in completing the enclosed questionnaire?

While the basic purpose of this study is of a fact-finding nature, it is quite likely that the end results would be of help to any state desiring to increase or improve their field activities. Therefore, we would especially appreciate your detailed comments and experiences on the items asked; specific case illustrations, of course, are most helpful. A stamped, self-addressed envelope is enclosed for your convenience.

Thanks very much for your assistance. We hope to have the preliminary reports of this study ready for the AVA meeting in December; we will be looking forward to meeting with you at that time.

Very truly yours,

Edward E. Scannell

Enclosures

Appendix #2: Questionnaire with summary data

CDTE Study of Off-Campus Activities
of D. E. Teacher-Educators

Please answer the following questionnaire as completely as you can. Your opinions and comments are most valuable to us and not only welcomed but heartily solicited.

I. General

A. How would you apportion your overall duties?

(18.18)% on-campus administration

(42.27)% on-campus teacher-education

(27.05)% off-campus activities

(12.50)% (other)_____

100%

B. How many class credit hours do you teach per week? _____

C. Does this number vary appreciably from semester to semester (excluding summer session)?_____If yes, please explain

_____

D. What is the average faculty credit-hour load for your department?_____

E. Comments _____

_____

II. Professional Off-campus activities

A. How much time do you typically allow for off-campus duties?

(43.5%) one day a week (21.7%) three days a week

(13.1%) two days a week

(21.7%) (other) _____

Comments: _____

_____

_____

B. Do you offer Professional D. E. Credit Courses off-campus?
(52.2%) Yes (47.8%) No (If No, Skip to Question C)

How often?

(8.3%) seldom (16.7%) every year

(8.3%) occasionally (50.0%) as need arises

(16.7%) each semester

Comments _____

_____

_____

_____

1. What credit courses have you offered off-campus in the past two years? Please list title, credit hours, approximate enrollment and one way distance from your campus.

Course Title	Cr.H.	Enroll.	Distance

2. Are you ever paid additionally for extension classes taught off-campus? (33.3%) Yes (66.7%) No

Please explain _____

3. Do students pay a higher tuition fee for off-campus classes? (25%) Yes (66.7%) No (8.3%) less

C. Do you schedule individual visits to coordinators during the year? (91.3%) Yes (8.7%) No

(66.7%) visit new coordinators each year

(28.8%) visit every coordinator each year

(57.1%) as requested by local schools

(38.1%) (other) _____

Comments: _____

D. Are you providing a planned program of in-service education for coordinators? (91.3%) Yes (8.7%) No. How? (Check items that apply)

(64.7%) Individual consultation with coordinators. How often?
(6.6%) Semi-annually, ___ Annually, (86.7%) as need arises
(6.6%) (other) _____

(90.5%) Group and area meetings. How often?
(10.5%) Semi-annually, (42.7%) Annually, (35.3%) as need arises
(15.5%) (other) _____

(80.9%) Workshop on-campus. How often?
___ Semi-annually, (64.7%) Annually, (35.3%) as need arises
___ (other) _____

___ (Other) _____

Comments: _____

E. Do you visit school districts that are considering the inauguration of a high school D. E. Program? (95.6%) Yes (4.4%) No

(82.6%) when requested by schools

(78.2%) when requested by state supervisor

_____ (other) _____

Comments: _____

F. Are you responsible for off-campus supervision of student D. E. teachers? (73.9%) Yes (26.1%) No
Please indicate your duties in this area _____

G. Do you visit D. E. high schools for purposes of program evaluation?

(69.5%) Yes (30.5%) No

(42.7%) only at request of the school concerned

(50.0%) at request of state supervisor

(6.3%) at schools of new coordinators

(12.5%) schools with new program

(12.5%) (other) _____

Comments: _____

H. Does your state have planned periodic evaluations of high school D. E. programs by yourself or state supervisor? (52.1%) Yes (47.9%) No If yes, please explain _____

I. Are you involved with your state coordinators conference?

(95.6%) Yes (4.4%) No

(90.9%) planning (81.8%) consultation

(59.1%) guest speaker

Comments: _____

III. General Comments: _____

_____

_____

_____

_____

_____

_____

_____

_____

_____

____ Check here if you would like to receive a report of preliminary findings based on these questionnaires.

Your Name _____

Position _____

School Address _____

City and State _____

Please return this questionnaire to Iowa Distributive Education Services, Department of Business Education, State College of Iowa, Cedar Falls, Iowa.

THANK YOU

*TRADE AND INDUSTRIAL EDUCATION; *COOPERATIVE EDUCATION; *ADMINISTRATOR GUIDES; *PROGRAM DESCRIPTIONS; *PROGRAM GUIDES
OHIO

The purpose of this booklet is to describe the objectives, standards, and operating policies of trade and industrial education which are applied in diversified cooperative training programs in Ohio. The text includes an explanation of the program, student eligibility, regulations, suggested fields, hints on organizing a program, advantages for the student, school and employers, school-employer relations, methods of instruction, community relations, advisory committess, community surveys, student relations, selection of the teacher-coordinators, teacher-coordinator qualifications, student placement, school facilities, scheduling, and other operating details. The appendix contains a sample student application and a suggested classroom floor plan. (EM)

THE DIVERSIFIED OCCUPATIONS PROGRAM OPENS THE PATHWAY TO ONE'S LIFE WORK

From: C. E. Rakestraw, *Training High School Youth for Employment*. p. xii

PREFACE

Part-time cooperative training is not new in vocational education; its beginnings in the United States antedates the Smith-Hughes Act by approximately twenty years. Cooperative training was contemplated by those who framed the Act and this type of training procedure has been carried on in many localities since 1917. Not until 1933, however, was the plan applied extensively to miscellaneous occupations in communities ranging from 5,000 to 25,000 in population.

Many states have had diversified cooperative programs in operation over a period of years and have given Ohio valuable help and suggestions for setting up its own program in Diversified Cooperative Training. Grateful acknowledgement is made to the State Departments of Vocational Education in Georgia, Indiana, Kentucky, Missouri, Oklahoma, South Carolina, Tennessee, and Texas for their help and cooperation.

Special acknowledgement is made to Philip R. Anderson, Assistant State Supervisor of Trade and Industrial Education for Southern Ohio, who undertook the original research necessary for the development of this manual, and promotion of the diversified cooperative program in Ohio during the past seven years.

Industrial Vocational Program In Diversified Cooperative Training

PROGRAM DEFINED: A program in **Diversified** Cooperative Training is designed to provide vocational training on a part-time basis for high school boys and girls, usually during their senior year. For one-half of the day, establishments of employers are used for training students in actual occupational activities. The other half day is divided between academic subjects and study related to work being done on-the-job. While several occupations may be included in the program, the individual student receives training in only one; thus, the term "diversified" applies to the program as a whole and not to the experiences of the student. The acquisition of occupational training in this manner does not interfere with graduation from the regular high school or subsequent enrollment in most colleges or universities.

The larger cities establish Trade and Industrial shops or vocational high schools to prepare students for entrance in trade and industrial occupations, but because of the equipment and facilities required, occupational training in smaller communities has usually been considered too costly. The Diversified Cooperative Training Program, however, enables the smaller community to offer occupational training to its youth. This type of program requires the school to furnish classroom facilities, reference materials, teaching aids, and the services of a teacher-coordinator. Local business and manufacturing establishments provide the skill or manipulative experiences for the students, while they work as employees of the establishments.

WHO IS ELIGIBLE: Any student sixteen years of age or older, who is employable and who has successfully completed a minimum of two years of high school, is eligible to enter the program. The student must have obtained approved employment, with the help and advice of the teacher-coordinator, in a satisfactory training situation. The occupations in which students are to be trained must require at least two thousand clock hours of training, including time spent in the study of related occupational information. All federal and state employment regulations must be followed in operating the program. The following is a partial list of possible fields of training:

Suggested Fields of Training

Auto Mechanics	Meat Cutting
Auto Body Painting	Metal Working Trades
Baking	Nursing Aids
Bricklaying	Painting
Carpentry	Patternmaking
Commercial Art	Photography
Cabinet Making	Plumbing
Drafting	Printing
Dress Making	Radio and Television Service
Dry Cleaning	Refrigeration Service
Electrical	Sheet Metal
Electrical Appliance	Shoe Repairing
Farm Machinery Repair	Tailoring
Furniture Repair	Upholstering
Laboratory Technician	Welding

Miscellaneous Other Trades

HOW TO ORGANIZE A DIVERSIFIED COOPERATIVE TRAINING PROGRAM

Acquainting the School Faculty with the Program. The success of the program depends a great deal on the cooperation of the entire school faculty. This cooperation is impossible unless both the school administration and faculty recognize the merits of the program and know why it has been added to the curriculum. The local superintendent of schools should call a conference of the school faculty in order to bring to its attention the needs of youth for some form of occupational training and to explain how the program will benefit both the school and the students. School faculties are generally willing to cooperate if they know the purposes and objectives of the program. Their help and guidance are essential to the teacher-coordinator in selecting and placing students in suitable training stations. A study of the employment classifications in Ohio shows that 58% of the employed people are in trade and industrial occupations. It certainly follows that a large number of graduates must find jobs within this large occupational area.

Too often teachers and administrators have regarded the Diversified Cooperative Training Program as a dumping ground for problem students who have been, to some extent, failures in other programs of study. It is, therefore, necessary to state that unless qualified students enter the program, it will fail. The business world has no place for a loafer or for one who is unfit. Every person enrolled must be able to benefit from the training. All factors must be considered in selecting students for the program. The fact that a student has constituted a problem may indicate that the school was not meeting the needs of that student.

The Diversified Cooperative Program can provide students and the school with many advantages, some of which are:

ADVANTAGES FOR STUDENTS

1. It gives them an opportunity to develop their aptitudes and interests.
2. They graduate from high school with enough fundamental training in an occupation to make them employable.
3. It gives the student who is dissatisfied with the ordinary academic or general curriculum the desire to remain in school and earn a high school diploma.
4. It assists the student who is in financial need to complete his school education.
5. Should a student decide to go to college, his occupational training may be an asset to him in earning his expenses. Furthermore, his experience as a wage earner will have helped him develop the proper attitude toward work, the ability to get along with people, and a deeper appreciation and understanding of the community in which he lives.
6. It helps the student to make adjustments to working conditions in industry while still under the supervision of the school.
7. The student is trained in the skills of his occupation under actual, rather than pseudo, working conditions.

ADVANTAGES FOR THE SCHOOL

1. It does not have to buy expensive shop equipment since the manipulative skills are acquired in the employer's establishment.
2. The program provides a means of projecting the school into the community.

3. It keeps a greater number of youth in school for a longer period of time.
4. It provides a direct avenue for meeting the community's needs for trained workers.
5. It provides a means of keeping the school abreast of business and industrial needs.

School-Employer Relations. Since this trade and industrial vocational program is a cooperative endeavor wherein the school assists business and industrial employers in training beginning employees, it is essential that both employers and employees be completely informed regarding the training program and their wholehearted support and cooperation secured. Too often an employer enters the program just to assist the school, without being aware of the real merits of the program. Training of new employees has always been a serious problem with employers, especially in establishments where the number of new employees does not justify the operation of regular training programs. The Diversified Cooperative Training Program enables an employer to benefit from systematic training for beginning employees. Many employers, never having gone through a regular training period themselves, will not be familiar with the advantages to be derived from organized training. Therefore, it will be necessary to discuss with these employers the benefits that are to be gained from such a program. They must understand that in most occupations a fully trained worker cannot be developed in a one or two year cooperative training program. Usually more time is necessary for a worker to acquire the skills and understandings essential to successful employment in a trade or occupation.

Methods of Instruction: Individual study of the trade technology pertaining to the occupation in which each student is receiving training is an essential feature of the Diversified Cooperative Training Program. Carefully planned, written assignment sheets are used in conjunction with appropriate reference materials. These lesson sheets are adopted from courses of study that have been prepared by competent persons in the various occupations. In preparing a training schedule for each beginner, the employer and the teacher-coordinator analyze the training requirements of each occupation and set up a schedule of work experiences. This schedule permits systematic and efficient training of the employee and assures the employer of an all-around trained person rather than a single skill worker.

Meeting of Selected Labor, Business and Industrial Leaders: To establish and conduct this type of educational program, the local school authorities should arrange a meeting of a selected group of business and industrial leaders, including representatives of any organized worker groups. At this meeting the need for providing vocational education opportunities for the youth of the community should be discussed, together with various ways and means of meeting such a need. The purposes and objectives of the Diversified Cooperative Training Program should be explained fully. Special effort should be made to develop within the group appreciation and understanding of the fact that it is their responsibility to aid the school in providing vocational training opportunities for the young people of the community. It should be pointed out that the majority of the youth of the community cannot, or do not, go to college; that they have to work for someone—if not in their own community, then somewhere else. Their training and ability will reflect upon the home community.

One of the most helpful means of explaining the program is the showing of the film entitled "Diversified Cooperative Training" which is available through the Trade and Industrial Education Service of the State Department of Education.

Advantages for Employers: The advantages of the Diversified Cooperative Training Program for the employer should be pointed out of this group:

1. It assists the employer in selecting qualified learners or beginners.
2. It provides his employees with a directed study of technical information essential to his occupation.
3. It provides his employees with a direct study of related information, such as job ethics, safety and first aid, and personal hygiene.
4. It insures organized training of his employees while on the job.
5. It correlates the actual work experiences of his employees with study of the necessay related technical information.
6. It allows the employer to supervise and help plan the training of his future employees.
7. It provides a full-time teacher-coordinator to assist the employer with his training problems.

8. It saves money for the employer, since an organized training program shortens the training period of new employees.

9. It gives the employer an opportunity to serve his community through the public schools.

Advisory Committee: This same meeting should pave the way for the organization of a representative advisory committee. Such a committee should be composed of representatives from the ranks of both employers and employees, and should not number more than six members. The advice and counsel of a representative advisory committee are needed many times in connection with certain problems which arise such as counseling and guidance of students, content of courses, selection of a qualified teacher-coordinator, proper and adequate equipment, and to acquaint the school authorities with the standard practices used in the trade, occupation, or business for which instruction is offered.

Survey of Community: The next step in setting up a cooperative program is to make a survey of the community in order to determine the occupational possibilities and training opportunities. Careful consideration must be given to the selection of training facilities. Working conditions in stores and plants, along with other factors, must be considered. Boys and girls should not be placed in any establishment where working conditions or environment are not conducive to their best welfare and progress in the type of training selected by them. Likewise, careful consideration must be given to the selection of students for the program. Unreliable students, those who are not interested, or who do not show sincerity of purpose will reflect upon the school and possibly make it difficult to place other students with employers.

Evaluation of Training Qualifications of Employer: The following criteria should be used in evaluating the training qualifications of the cooperating employer:

1. Opportunity for employment after training.
2. Stability of the establishment.
3. Opportunity for advancement.
4. Social value.
5. Length of training period.

6. Training carry-over.
7. Regularity of employment.
8. Pay.
9. Training facilities.
10. Hazards.

Acquainting Students with the Program: The next step is to explain the program to students who are eligible to enroll. Students who are interested should fill out an application form for admission to the program. An example of a satisfactory form will be found in the Appendix. The teacher-coordinator should have a personal interview with each student and with his parents so that the program is thoroughly understood by the parents as well as the student. In the initial interview with the student and his parents, it should be explained that the school does not make the final selection of the students for the program, but that the employer selects the student or students he wishes to employ. The student must have secured approved employment prior to being admitted to the program.

Selection of the Teacher-coordinator: After it has been determined that there is need in the community for a Diversified Cooperative Training Program, that there are sufficient number of satisfactory training situations, and that there are students wanting to enter the program, the next step is to secure a teacher-coordinator. Much depends on the teacher-coordinator; the success or failure of the program is in his hands. The qualifications of a good teacher-coordinator are difficult to outline; he is an administrator, supervisor, teacher, public relations man, and counselor all in one, especially in the small community where the Diversified Cooperative Program may be the only available type of vocational education program. He must be an individual with the ability to meet and deal with business, industrial, and labor leaders of the community. To secure and maintain their cooperation, he must be familiar with business and industrial practices. Many successful teacher-coordinators have had technical training, which is a distinct asset in the supervised and directed study phase of the program. Above all, the teacher-coordinator must like people and believe in youth.

Qualifications of the Teacher-Coordinator: To meet the certification requirements of the Certification Division of the State Department of Education, the teacher-coordinator should have the following qualifications:

1. Education — Graduation from a college or university with a major in a technical field or completion of requirements for a four-year provisional vocational trade and industrial certificate.
2. Teaching Experience — One year of teaching experience in the field of trade or industrial education or other acceptable program, or the completion of a minimum of eight semester hours of college credit including the following courses:
   a. Principles and Practices of Vocational Education or Survey of Education
   b. Educational and Industrial Coordination
   c. Developing Content of Shop and Related Courses
   d. Organizing and Operating a Diversified Cooperative Training Program
3. Occupational Experience — Two years of industrial experience. Note: Industrial experience should be interpreted as those trades listed in the **Ohio Plan of Trade and Industrial Education.**

Student Placement: After the survey of the community has been made and the students have made the necessary applications, arrangements should be made to send the student, with an introductory memorandum, to the employers for their interviews. The employers should be notifed that certain students are to be interviewed, and a definite appointment made for each interview. The employer should notify the teacher-coordinator when he has tentatively employed a student. The minimum number of students enrolled in the program should not be less than fifteen nor the maximum more than twentyfive. After the designated number of students have been accepted, the teacher-coordinator completes the steps necessary for employing the student. These steps follow:

1. Complete the Diversified Training Program Agreement (see Appendix) and have it signed by the employer, student, parent, and the superintendent of schools or the teacher-coordinator.
2. Obtain part-time working certificate for the student. Ohio: Form A-1 front, A-2 back.
3. Have employer fill out pledge card. Ohio: Form A-3.
4. Physical examination. Ohio: Form A-4 front, A-5 back.
5. Obtain age and schooling certificate for student. Ohio: Form B. Two copies signed by the superintendent of schools, one for the employer, the other to be retained by the superintendent of schools.

6. Have student secure Social Security Number.
7. Prepare in cooperation with each employer an organized Training Plan for the on-the-job phase of the training program.
8. Order the necessary study guides and reference books for each student. The Instructional Materials Laboratory, 200 Communications Building, Ohio State University, Columbus 10, Ohio, can be very helpful in advising the teacher-coordinator in the selection, source and use of instructional materials and can provide copies of occupational outlines for use in preparing training plans in a large number of occupations.
9. Present teaching certificate to the "on-the-job" instructor. Certificates may be obtained from the Instructional Materials Laboratory, 200 Communications Building, The Ohio State University, Columbus 10, Ohio. The purpose of the certificate is to encourage and emphasize training instead of part-time work in the training agency. A copy of this certificate may be found in the appendix of this monograph.

Facilities to be Furnished by the School: The school is expected to furnish adequate classroom facilities for the related technology class. See the Appendix for a floor plan of such facilities. The classroom should contain study tables, and chairs, blackboards, bulletin boards, filing cabinets, and a desk for the teacher-coordinator. A small conference space should be provided in a corner of the classroom. An adequate supply of reference materials—composed of textbooks, workbooks, manuals, bulletins, charts, correspondence course materials, etc.—for each occupation in which training is being offered, must be furnished by the school. The minimum essential equipment for such a classroom is as follows:

CLASSROOM EQUIPMENT

1. Two four-drawer, letter-size file cabinets.
2. One cabinet for student notebooks and complete assignments.
3. One bookcase for reference books.
4. One cabinet for instructional material.
5. One flat-top teachers desk.
6. One large blackboard.

7. Two cork bulletin boards.
8. One case for bulletins and trade literature.
9. A telephone for the teacher-coordinator's use.
10. Movie projector.

Scheduling and Other Operating Details: The students should be scheduled for two consecutive periods in the related technology class. There should be one period when the whole group is together so that the common problems (socio-economic) can be discussed by the entire group. For example, a student should be scheduled for related technology either the first and second or third periods so that the second period would be the group period. Where sixteen units of credit are required for graduation a minimum of three should be given for the Diversified Cooperative Training Program. In situations where seventeen or eighteen units are required, three and one half units of credit are given. One grade is issued for the program in preference to a separate grade for related technology and another for the work experience.

Limitations In Area of Occupation Chosen: Since the Diversified Cooperative Training Program is intended to be a trade and industrial nature and will be operating under the auspices of the Trade and Industrial Education Service, no occupations other than trade or industrial may be included in the program.

Precautions: This program, like any other newly organized project or program, should be begun on a conservative basis. The program, actually, may cover only one-half or even less of the community's potential employment possibilities the first year; for, during the organizational period, the teacher-coordinator must spend a large amount of his time in promoting the program and in perfecting its organization. Throughout the year new fields of training should be explored, and the program diversified over as wide a range as feasible. Likewise, students should be counseled and assisted in selecting desirable occupations, so that the superior students will be available for placement the second year. The general tendency may be that of over placement in certain occupations at first, but if a careful analysis is made of the occupational situation and adjustments made accordingly, a reasonable absorption of trainees can be obtained. There will always be a number of isolated specialty fields in which an occasional student can be placed, but there is no justification for training a student for an occupation in which there are no employment possibilities

within a reasonable distance of his home community. Handled in a proper manner, with training distributed according to the actual absorption ability of the various occupations, the program will become a permanent part of the regular school curriculum. As time goes by, the local employers will depend more and more on the program as a means of obtaining new employees, and will continue to have faith that their local public school is rendering a valuable service to a part of the student body that intends to end their formal schooling with high school graduation.

How to Secure Further Assistance: For further information relating to the organizing or the financing of the Diversified Co-operative Training Program, write or call Supervisor, Trade and Industrial Education Service, 220 S. Parsons Avenue, Columbus 15, Ohio.

Appendix

(SAMPLE STUDENT APPLICATION BLANK)

.....Public Schools

....., Ohio

STUDENT APPLICATION FOR ADMITTANCE TO THE DIVERSIFIED COOPERATIVE TRAINING PROGRAM

Name of student..... Date.....19....

Age (last birthday)..... Date of birth..... Height..... Wt.....

Explain: .....

Father's or guardian's name..... Occupation.....

Occupation or type of employment desired.....

Reason for your preference.....

What physical disabilities do you have?.....

.....

.....

Have you ever been employed?..... When?..... Where?.....

.....

Nature of work .....

Number of high school credits you now have: English.....Math.....

Science..... History..... Foreign Language..... Social Science.....

Commercial..... Ind. Arts..... Others.....

What required subjects do you need for graduation?.....

If accepted for the program, do you agree to complete the training period?.....

List three teachers with whom you have had classes for at least one school year:

1. .....
2. .....
3. .....

List one other person who knows you well.....

What are your hobbies?.....

Signed..... Approved by.....

Student — Parent or guardian

DIVERSIFIED COOPERATIVE TRAINING AGREEMENT

Date.....

1. ..... will be permitted to enter training at ..... for the purpose of gaining knowledge and experience in..... ..... (job objective)

2. The cooperative course of training is designed to extend over a (one or two) year period with a minimum of 15 hours per week, exclusive of Saturday work and a maximum of.....hours including Saturday, required for the work experience and (one or two) periods in each school day for related technical study and occupational adjustment information.

3. The coordinator shall, with the assistance of the employer, prepare an outline of the operations to be learned on the job and the related study units for the related classroom work. This outline or training plan is to be prepared before signatures are affixed to the agreement.

4. The wages to be paid the student are....., in accordance with the recommendations of the local advisory committee and are in conformance with the Wage and Hour provisions of the Fair Labor Standards Act of 1938 as amended.

5. The student will receive a variety of experiences in the training station and will not remain at any one operation, job, or phase of the occupation longer than is necessary for him to become reasonably proficient.

6. The student, while in the process of training, will have the status of student learner, neither displacing a regular worker now employed nor substituting for a worker that would be ordinarily needed by the training station.

7. All complaints shall be made to and adjusted by the coordinator.

8. The parent or guardian shall be responsible for the personal conduct of the student while in training.

9. The student will be working with or closely supervised by.... .....who will be the training instructor.

10. The employer-teacher will make a rating of the student's work each six weeks.

11. The coordinator will visit each student on the job regularly and will be acquainted with the training station personnel with whom the student works.

12. The coordinator may withdraw or transfer the student when it is mutually agreeable to all parties concerned.

13. The employment and training of the student shall be in accordance with federal, state, and local laws and regulations.

14. The student will not be employed in another part-time job which involves work beyond his Diversified Cooperative Training schedule.

AGRICULTURAL EDUCATION; BUSINESS SKILLS; CREDIT (FINANCE); *JOB SKILLS; *EDUCATIONAL NEEDS; *FARMERS; OCCUPATIONAL SURVEYS
IOWA

The purpose of the study was to determine (1) competencies in farm credit needed by farmers, (2) factors associated with competencies needed and possessed, (3) sources of training, and (4) information for educational program planning. A questionnaire including 26 understandings and 17 abilities selected by a panel of 16 specialists was returned by 117 of a random sample of 177 farmer-members of the Central Iowa Farm Business Association and from 94 of 305 farmers from 14 counties served by the Association. In all cases respondents indicated that they possessed a lower degree of competence than was needed for successful use of farm credit. Association members ranked the importance of the understandings, credit rating, net farm income, and repayment capacity highest in degree of competence needed. The greatest needs in abilities were record keeping, record analysis, management returns computation, lender confidence attainment, and need indentification. Association members possessed the least competence in the understanding of crop insurance as a means to reduce risk, sales contracts for different products, credit life insurance, and availability of government emergency loans. Comparisons showed that the wider differences between total over-all mean scores for competence needed and scores for comptenence possessed were among association members, larger operators, renters, less-educated farmers, and farmers with medium gross income. The competency rating in tabular form is included. This is an abstract of an M.S. thesis submitted to Iowa State University of Science and Technology. (JM)

This is an abstract of a thesis submitted in August of 1965 to Iowa State University of Science and Technology by Ober Jay Anderson in partial fulfillment of the requirements for the degree Master of Science.

The study is one of a series conducted by the Department of Education of Iowa State University of Science and Technology with assistance of graduate students in agricultural education in cooperation with the Iowa Agriculture and Home Economics Experiment Station and the Vocational Agriculture Section, Division of Vocational Education, State Department of Public Instruction, Des Moines, Iowa.

This abstract was prepared by Ober Jay Anderson with assistance of Alan Kohler, research assistant for the Iowa Agriculture and Home Economics Experiment Station Project 1253, under the direction of Professor C. E. Bundy.

COMPETENCIES IN FARM CREDIT NEEDED BY FARMERS

by

Ober Jay Anderson

Purpose of the Study

The purposes of the study were: (1) to determine the competencies in farm credit needed by farmers and the degree of each competency needed for successful use of farm credit; (2) to determine the factors which have relationship to competencies needed and possessed; (3) to determine sources of training for these competencies; and (4) to provide information needed in planning an educational program that will enable farmers to use farm credit efficiently.

Method of Procedure

Sixteen farm credit specialists served as a panel to select the competencies that were included in this study. Of the competencies which were selected, 26 were classified as understandings and 17 as abilities. They are listed on Table 1.

A questionnaire was developed which included directions for evaluating each competency with respect to the degree to which it is needed in order to enable the respondent to use farm credit successfully and the degree to which each is presently possessed. The questionnaire was submitted to a random sample of 177 members of the Central Iowa Farm Business Association and a random sample of 305 farmers from the 14 counties served by the Association. Usable questionnaires were received from 117 association members and from 94 farmers in the random sample of other farmers. The degree of competency needed and the degree presently possessed by respondents were indicated for each of the understandings and abilities by check marks on a scale of 1 through 5. A check in column 1 meant no competence needed or possessed and in column 5 meant very much competence needed or possessed. The responses were analyzed by the use of mean scores.

Findings

Mean scores for degree of competency needed and possessed in each of the 26 understandings and the 17 abilities are presented in Table 1. In all cases respondents indicated that they possessed a lower degree of competence than was needed for successful use of farm credit. The difference between overall mean scores for competence needed and possessed was .6 for the association members and .5 for the random sample farmers.

In 19 of the 43 understandings and abilities the mean scores of both association members and other farmers were 4.0 (much competence needed) or above for degree of competence needed in each item. The mean scores for the degree of competence needed by association members were 4.3 or higher (more than much competence needed) for the understandings: of importance of a good credit rating, of net farm income, and of repayment capacity; and for the abilities: to keep complete and accurate farm records, to analyze and interpret farm records and results, to compute management returns, to gain confidence of lenders, and to distinguish between actual needs and mere desires.

The mean scores for the degree of competence possessed by association members were highest for the competencies: of understanding the importance of a good credit rating (4.3), of keeping complete and accurate farm records (3.9), of methods of charging interest (3.8), of understanding repayment capacity (3.8), and of computing true annual interest rate (3.8).

The competencies rated lowest by the association members on the basis of need were understandings of availability of government emergency loans, of crop insurance, and of credit life insurance. The scores were from 3.1 to 3.3, just above some competence needed. Farmers in the random sample rated the same three competencies and in addition an understanding of the relationship between farm and home credit as the lowest from the standpoint of need among the 43 understandings and abilities included in the questionnaire.

The association members indicated that they possessed the least competence in the understanding of crop insurance as a means to reduce risk (2.9); of sales contracts for soybeans, beef, etc. (2.7); of credit life insurance (2.9); and of availability of government emergency loans (2.3).

Comparisons among various groups disclosed the following differences between total over-all mean scores for competence needed and possessed. (1) Association members had slightly wider differences than random sample farmers. (2) Farmers with fewer years of experience had nearly the same scores as those with more experience. (3) Operators of larger acreages had wider differences than those with smaller acreages. (4) Renters had wider differences than owners, owner-renters and members of a partnership. (5) Farmers with less education had wider differences than those with more education. (6) Farmers with medium gross farm incomes had wider differences than farmers with low or high gross farm incomes.

The product moment coefficient of correlation was used to analyze the relationship of selected controls and competency scores for the two groups. Significant correlations were found between years of farming experience and educational attainment (-), farm size and gross farm income (+), and amount of credit used and gross farm income (+) for both association and random sample farmers.

Table 1. Degree that farm credit competencies were needed and possessed by Central Iowa Farm Bureau Association (CIFBA) members and by farmers in the random sample.

Rank[a]	Competencies--Understandings needed (26 items)	Overall rank[b] (43 items)	Mean Scores--Understandings: Needed[c] (CIFBA N=117)	Possessed[c] (CIFBA N=117)	Needed[c] (Random sample N=94)	Possessed[c] (Random sample N=94)
1	Importance of a good credit rating	1	4.6	4.3	4.4	4.2
2.5	Net farm income	6	4.3	3.7	4.1	3.7
2.5	Your repayment capacity	6	4.3	3.8	4.0	3.6
4.5	Importance of adequate operating reserves	13	4.2	3.4	4.0	3.5
4.5	Priority of claims on income	13	4.2	3.4	3.8	3.2
8	Capital and its relationship to other farming resources	22	4.1	3.3	4.0	3.3
8	Your own attitude towards "being in debt"	22	4.1	3.6	4.0	3.8
8	Risk and uncertainty of using credit	22	4.1	3.6	4.0	3.6
8	Methods of charging interest	22	4.1	3.8	4.0	3.6

Pub Date - Oct65 11p.

AGRICULTURAL EDUCATION; AGRICULTURAL SKILLS; BUSINESS SKILLS; CREDIT (FINANCE); OCCUPATIONAL SURVEYS; *JOB SKILLS; *OFF FARM AGRICULTURAL OCCUPATIONS; *EDUCATIONAL NEEDS

A study was conducted to determine competencies needed by farm credit agency employees, determine the relation of certain factors to competence needed and possessed, and plan for educational needs. A panel of nine credit agency representatives listed 33 competencies, 13 agricultural and 20 of a general credit nature, which were rated as to degree needed and possessed by 100 credit agency employees. The degree of competency needed was higher than the degree possessed for 31 of the 33 competencies. The largest differences were for (1) guidelines used for loan analysis, (2) maximizing credit return, (3) cash flow and credit needs, (4) payment types and forebearance plans, and (5) business law. Those ranked highest in need included cognizing poor and good financial management, conversing with farmers, and determining repayment ability and desire. Those ranked highest as possessed included conversing with farmers, figuring net worth, and working basic arithmetic. Men with farm backgrounds possessed higher agricultural competence and those without a farm background possessed higher nonagricultural competence. Men who had attended an agricultural college possessed higher competence in both categories. Annual salaries ranged from less than $6,000 to over $15,000. Those who had vocational agriculture, had a farm background, and were older earned higher salaries. This is an abstract of an M.S. thesis submitted to Iowa State University of Science and Technology. This is an abstract of a thesis submitted in October of 1965 to Iowa State University of Science and Technology by Keith Ransom Carlson in partial fulfillment of the requirements for the degree of Master of Science.

The study is one of a series conducted by the Department of Education of Iowa State University of Science and Technology with assistance of graduate students in agricultural education in cooperation with the Iowa Agriculture and Home Economics Experiment Station and the Vocational Agriculture Section, Division of Vocational Education, State Department of Public Instruction, Des Moines, Iowa.

This abstract was prepared by Keith Ransom Carlson with the assistance of John B. McClelland of the Department of Education under the direction of Professor C. E. Bundy.

COMPETENCIES NEEDED BY FARM CREDIT AGENCY EMPLOYEES

by

Keith Ransom Carlson

Purpose of the Study

The purposes of the study were: (1) to determine the competencies needed by men engaged by farm credit agencies, (2) to determine the relation of salary, experience, number of clients, years of vocational agriculture, age, farm background, type of agency, college attendance and miles traveled to the evaluation of the degree of competence needed and possessed by farm credit employees in Iowa, and (3) to plan for educational needs of future replacement farm credit employees.

Method of Procedure

For this study the major sources of non-governmental credit were used. The basic competencies used were suggested by nine selected men employed by production credit associations, federal land bank associations and outside farm representatives of Iowa banks. The list of competencies was incorporated into questionnaires and mailed to all banks that employed outside farm representatives, all production credit association managers, and managers of the federal land bank associations in Iowa. These men were asked to determine the degree they felt the competencies were needed and to indicate the degree they possessed these competencies.

Findings

Of the 33 competencies used 13 were of a definite agricultural origin, while the remaining 20 were of a general credit nature. The farm credit agency employees evaluated the degree needed higher than the degree possessed for 31 of the 33 competencies used. The two competencies that had a higher degree possessed than degree needed rating were the understanding of different varieties of crops and the ability to figure depreciation.

The largest differences in mean needed and possessed scores were between: understanding of basic credit guidelines used for loan analysis, mean needed score 8.06 and mean possessed score 6.92; ability to use credit for maximum returns, mean needed score 7.39 and mean possessed score 6.30; ability to determine cash flow and credit needs, mean needed score 7.50 and mean possessed score 6.43; understanding of types of payments and forbearance plans mean needed score 7.53 and mean possessed score 6.46; and understanding of business law, mean needed score 5.93 and mean possessed score or 4.83.

Table 1. Relationship of ranked mean credit competency scores needed and possessed by farm credit employees

Competency	Mean needed score[a]	Rank	Mean possessed score[b]	Rank	Mean score difference
Recognize poor and good financial management	8.28	1	7.41	4	.87
Converse easily with farmers	8.26	2	7.87	1	.39
Determine repayment ability and desire	8.20	3	7.24	6	.96
Recognize ability to handle credit	8.12	4	7.19	7	.93
Set up loans so they fit the individual farms	8.10	5	7.33	5	.77
Basic credit guidelines used for loan analysis	8.06	6	6.92	12	1.14
Evaluate character	7.98	7	7.13	8-9	.85
Work basic arithmetic	7.92	8-9	7.58	3	.34
Loan security (chattel and real estate)	7.92	8-9	7.13	8-9	.79

[a]Degree competency needed: 0-1--None, 2-3--Little, 4-5--Some, 6-7--Much, 8-9--Very much

[b]Degree competency possessed: 0-1--None, 2-3--Little, 4-5--Some, 6-7--Much, 8-9--Very much

Table 1. (Continued)

Competency	Mean needed score[a]	Rank	Mean possessed score[b]	Rank	Mean score difference
Advise farmers how to use credit	7.88	10	7.11	10	.77
Figure net worth	7.84	11	7.59	2	.25
Judge a farmer's drive and character	7.78	12	6.95	11	.83
Draw effective loan documents	7.63	13	6.79	15	.84
Type of payments and forbearance plans	7.53	14	6.46	19	1.07
Determine cash flow and credit needs	7.50	15	6.43	20-21	1.07
Use credit for maximum returns	7.39	16	6.30	22	1.09
Analyze a farmer's ability to select and handle farm enterprises	7.34	17	6.43	20-21	.91
Figure livestock income and expenses	7.29	18	6.82	13	.47
Compute net income	7.12	19	6.81	14	.31
Budget expected income and expenses	7.10	20	6.70	16	.40
Figure livestock income over feed costs	7.01	21	6.68	17	.33
Reasonable production costs for crops	6.92	22	6.52	18	.40

Table 1. (Continued

Competency	Mean needed score[a]	Rank	Mean possessed score[b]	Rank	Mean score difference
Compute management returns	6.70	23-24	6.04	25	.66
Assess health and family factors	6.70	23-24	5.90	28	.80
Family living expenses	6.44	25	6.08	24	.36
Economic principles	6.43	26	5.77	30-31	.66
Short range outlook	6.40	27-28	5.91	27	.49
Bookkeeping principles	6.40	27-28	5.77	30-31	.63
Reasonable machinery investment-rotated acre	6.39	29	5.94	26	.45
Figure depreciation	6.01	30	6.10	23	-.09
Business law	5.93	31	4.83	33	1.1
Proper use of fertilizer and insecticides	5.89	32	5.84	29	.04
Different varieties of crops	5.70	33	5.73	32	-.03

The 10 competencies that ranked the highest in need were: (1) recognize poor and good financial management, (2) converse easily with farmers, (3) determine repayment ability and desire, (4) recognize ability to handle credit, (5) set up loans so that they fit the individual farm, (6) set basic credit guidelines used for loan analysis, (7) evaluate character, (8-9) work basic arithmetic, (8-9) understand loan security (chattel and real estate) and (10) advise farmers how to use credit.

The 10 competencies that had the highest ranking mean possessed scores were: (1) converse easily with farmers, (2) figure net worth, (3) work basic arithmetic, (4) recognize poor and good financial management, (5) set up loans so they fit the individual farm, (6) determine repayment ability and desire, (7) recognize ability to handle credit, (8-9) understand loan security (chattel and real estate), (8-9) evaluate character, and (10) advise farmers how to use credit.

The farm credit employees indicated the lowest need for the following competencies: compute management returns, assess health and family factors, family living expenses, economic principles, bookkeeping principles, short range outlook, reasonable machinery investment per rotated acre, figure depreciation, business law, proper use of fertilizer and insecticides, and different varieties of crops.

The competencies with the lowest mean possessed scores were: figure depreciation, family living expenses, compute management returns, reasonably machinery investment/rotated acre, short range outlook, assess health and family factors, proper use of fertilizer and insecticides, bookkeeping principles, economic principles, different varieties of crops, and business law.

Men with a farm background possessed a higher degree of competence for agricultural competencies than those men without a farm background. Men not raised on a farm, did, however, possess more competence in non-agricultural competencies. Men who attended an agricultural school possessed a higher degree of competence in both categories when compared with men who did not attend an agricultural school.

The difference between needed and possessed means was the largest for non-agricultural competencies. The smallest difference between needed and possessed means was for non-agricultural competencies by men who were not raised on a farm or by those who attended an agricultural college.

The salary varied widely for the 100 men employed by credit agencies. Five men earned less than $6000 while two men were earning in excess of $15,000 per year. One-half of the men earned between $7001 and $9000 per year. The years of experience had an effect on the salaries received by the men. The modal salary for the men who had worked from 6-10 years was $7001-$8000. Men with 11-15 years of experience had modal salaries of $9001-$10,000. After 15 years of experience it became less obvious that the years of experience affected the salary received.

Vocational agriculture in high school appeared to have had an influence on salaries. The modal range of the group which did not take vocational agriculture in high school was $7001-$8000. The modal range for those with either three or four years of vocational agriculture was $9001-$10,000.

The outside farm representatives had the most variation in salary from a low of $5000 to over $15,000. Production credit association manager's salaries ranged from $7001-$10,000, while the managers of federal land bank associations earned $6001-$10,000 per year.

Salaries were higher for those who were raised on a farm than those who were not raised on a farm. The modal group for those raised on a farm was $9001-$10,000, while the modal group for those not raised on a farm had salaries between $7001-$8000 per year.

There was a high correlation between salary and age. The modal salaries for the respective ages were as follows: 26-30 years of age, $6000-$7000; 31-35 years of age, $7001-$8000; and 36-45 years of age, $8001-$9000. After 45 years of age the age appeared to have less influence on salary, however, the two men with salaries over $15,000 were in the 46-51 years of age group.

There were several differences between the men hired for particular agencies. Most of production credit association managers and outside farm representatives were raised on a farm, 91 and 89 percent respectively. Seventy-five percent of the federal land bank association managers were raised on farms.

None of the production credit association managers traveled over 13,000 miles each year. Considering all types of credit agencies, twenty-one percent of the men traveled over 12,000 miles per year. The federal land bank association managers, however, did the most traveling each year.

Seventy-five percent of the production credit association managers had not taken vocational agriculture in high school. This compared with 56 and 55 percent for the federal land bank associations and outside farm representatives respectively.

Outside farm representatives and federal land bank association managers were closely related as to age with men from 26 to over 66 years of age. The production credit association managers ranged from 31 to 60.

Eighty-five percent of the credit employees attended college as part of their preparation for their jobs. The production credit agency men had the lowest percent attending college, as only 67 percent attended.

Of the 58 men with no high school vocational agriculture, 84 percent had attended college. Of the men with three or four years of vocational agriculture, however, 96 percent had attended college. This indicated that vocational agriculture did not interfere with college preparation and probably encouraged attendance.

Implications

The need and opportunities in the farm credit field should be shown to the high school students. The value of a farm background and training in vocational agriculture should be stressed. The encouragement to attend college and the higher salaries for those students who enrolled in vocational agriculture should not be overlooked during guidance activities of the vocational agriculture instructor. Training in the 33 competencies should begin in the high school with as much practical experience as possible. Additional training by the agricultural colleges or the banks themselves would also appear in order for the farm credit employees.

AGRICULTURAL SKILLS; AGRICULTURAL EDUCATION; OCCUPATIONAL SURVEYS; *MARKETING; *LIVESTOCK; *FARMERS; *EDUCATIONAL NEEDS; *JOB SKILLS
IOWA

The purposes of this study were to determine the marketing competencies needed by livestock producers, and the relation of personal and training background factors to the producer's evaluation of the need and possession of each competency, and to plan for the educational needs of producers. A list of 74 competencies developed by a panel of 12 livestock specialists and refined by livestock association secretaries, was evaluated as to the degree each was needed and possessed by 80 beef, 81 swine, and 79 sheep producers in Iowa. The relative need, relative possession, and difference between need and possession were computed for each competency. Beef producers needed the abilities to estimate grade and yield of cattle, to estimate cost of grain to select a market, and figure returns above costs. Sheep producers needed the abilities to determine when to sell lambs for best meat carcass, grade sheep and lambs, figure feed conversion, and determine costs and marketing methods. Swine producers needed the abilities to figure feed cost and conversion, to select profit producing practices and to have adequate loading facilities. Understandings needed by the three groups included market cycles and trends and price affecting factors. The greatest differences between competencies needed and possessed were found among younger producers, less experienced producers, more educated sheep producers, less educated beef producers, smaller operators, those with less vocational agriculture, and adult livestock production training, and those not in purebred or cross bred production. Correlations were found among control factors, between control factors and competencies, and between need and possession of competencies. This is an abstract of an M.S. thesis submitted to Iowa State University of Science and Technology. (JM)

This is an abstract of a thesis submitted in August of 1965 to Iowa State University of Science and Technology by Lindley John Hoyt in partial fulfillment of the requirements for the degree of Master of Science.

The study is one of a series conducted by the Department of Education of Iowa State University of Science and Technology with the assistance of graduate students in agricultural education in cooperation with the Iowa Agriculture and Home Economics Experiment Station and the Vocational Agriculture Section, Division of Vocational Education, State Department of Public Instruction.

This abstract was prepared by Lindley John Hoyt with the assistance of Alan Kahler, research assistant for the Iowa Agriculture and Home Economics Experiment Station Project 1253, under the direction of Professor C. E. Bundy.

COMPETENCIES IN LIVESTOCK MARKETING NEEDED BY FARMERS

by

Lindley John Hoyt

Purpose of the Study

The purposes of this study were: (1) to determine the competencies needed by beef, sheep, and swine producers in order to be successful in livestock marketing, (2) to determine the relation of certain personal factors in the background and training of a selected sample of beef, sheep, and swine producers in Iowa to their evaluation of the degree of competence needed and the degree possessed in each of the competencies, (3) to plan for educational needs of future replacement of beef, sheep, and swine producers.

Method of Procedure

The panel responsible for developing the list of competencies used in this study consisted of 12 men, who are specialists in beef, sheep, and swine production and marketing.

The competencies selected by the specialists were carefully scrutinized by the state secretaries of beef, sheep, and swine associations before they were used in a questionnaire which was submitted to a select group of 100 beef, 100 sheep, and 100 swine producers in Iowa. Those livestock producers were asked to evaluate the degree of competency that they needed to succeed in marketing livestock efficiently, and the degree that they presently possessed. The rating of degree of competency was on a five-point scale (1 to 5). Certain personal information was requested for use in stratifying the respondents. Usable questionnaires were received from 80 beef, 81 swine, and 79 sheep producers.

Findings

The competencies needed in the various areas of livestock production which were selected by the panel of specialists are listed in the tables. Of the 74 competencies, 35 were classified as abilities and 39 as understandings.

The mean scores for the degree of the competencies which beef producers indicated that they needed and possessed are shown in Table. 1. The competencies were scored on a five-point scale, with 5 indicating very much competence needed, or possessed, and 1

Table 1. Degree that beef marketing competencies were needed and possessed by selected producers by major livestock enterprise

Competencies	Mean scores					
	N=80 Beef		N=50 Sheep		N=63 Swine	
	Needed[a]	Possessed[b]	Needed[a]	Possessed[b]	Needed[a]	Possessed[b]
Ability to:						
Estimate weight of beef cattle	3.8	3.3	2.4	2.1	3.1	2.6
Sell cattle when they are ready for their grade	3.0	3.7	2.9	2.1	3.3	2.6
Estimate grade and yield of cattle	4.1	3.4	2.6	2.0	3.0	2.3
Figure pencil shrink	3.8	3.5	2.6	2.0	3.0	2.3
Estimate cost of grain at different weights	4.0	3.6	2.7	2.2	3.1	2.7
Select market for kind of cattle produced	3.9	3.7	2.7	2.2	2.8	2.7
Prepare cattle for shipment	3.6	3.8	2.4	2.3	2.7	2.6
Feed properly when moving cattle to minimize shrink	3.7	3.6	2.4	2.3	2.7	2.6
Select trucker on livestock hauling reputation	3.5	3.8	2.6	2.6	2.4	2.9
Select commission firm	3.8	3.1	2.5	2.1	2.7	2.5
Select market (local-terminal)	4.0	3.8	2.7	2.3	2.8	2.8
Figure returns above costs	4.1	3.8	2.8	2.5	2.9	2.7
Overall mean scores for abilities	3.8	3.6	2.6	2.2	2.9	2.6
Understandings of:						
Beef marketing trends and cycles	4.1	3.0	2.8	2.2	3.1	2.2
Producing cattle which meet market demands during the year	4.1	3.4	2.7	2.0	3.0	2.2
Spreading marketing throughout the year	4.0	3.4	2.6	2.2	2.8	2.4
County, state and national beef promotional organizations	4.4	2.9	3.2	2.1	2.8	2.3
Beef futures market	3.9	2.5	2.7	1.7	2.9	1.9

[a]5--very much competence needed, 4--much competency needed, 3--some competence needed, 2--little competence needed, 1--no competence needed.

[b]5--very much competence possessed, 4--much competence possessed, 3--some competence possessed, 2--little competence possessed, 1--no competence needed.

Table 1 (continued)

Competencies	Mean scores					
	N=80 Beef		N=50 Sheep		N=63 Swine	
	Needed	Possessed	Needed	Possessed	Needed	Possessed
Understanding of:						
Effect of chain stores on price of cattle	4.0	3.2	2.6	1.9	2.9	2.2
Consumer demands for beef	4.2	3.3	3.2	2.5	2.5	3.4
Long-range effect of wage contracts giving cost-of-living wage increases	4.0	2.6	2.6	2.3	3.5	2.1
Meat substitutes and overall effect on beef cattle prices	4.0	2.8	3.0	1.9	3.1	2.1
Feed additives as related to carcass quality	4.0	3.2	3.2	2.4	3.8	2.6
Livestock loss and factors causing such loss	4.2	3.5	3.1	2.9	3.1	2.5
Carcass cut-out information	3.5	3.1	3.3	3.0	3.4	2.5
Effect of holding cattle over for another year's income	4.0	3.5	2.8	2.6	2.7	2.2
Overall mean scores for understandings	4.0	3.1	2.8	2.3	3.0	2.3

indicating no competence needed, or possessed. The mean scores were 4.0 (much competence needed) or higher for the abilities: to estimate grade and yield of cattle, to estimate cost of grain at different weights, to select a market, and to figure returns above costs.

The mean scores of beef producers for understandings needed were 4.0 or higher for the understandings: of beef marketing trends and cycles; of producing cattle which meet market demands during the year; of county, state and national beef promotional organizations; of effect of chain stores on prices of cattle; of consumer demands for beef; of long-range effect of wage contracts giving cost-of-living wage increases; of meat substitutes and overall effect on beef cattle prices; of feed additives as related to carcass quality; of livestock loss and factors causing such loss; and understanding of the effect of holding cattle over for another year's income.

As shown in Table 2, the mean scores of sheep producers for the degree of competence needed were 4.0 (much competence needed) or higher for the abilities: to determine when to sell lambs to produce a desirable meat carcass, to grade sheep ready for market, to sort lambs by weight and grade, to figure feed conversion, to figure returns above costs, and to determine the marketing method giving the greatest return.

The mean scores of sheep producers for understandings needed which were scored 4.0 or above were for the understandings: of sheep market trends and cycles, of grading wool and its effect on gross income from sheep, of factors influencing the price of wool, of wool pools and their long-range effect on your wool income, of government wool support program, of livestock loss and factors causing such loss, and of importance of meat-type rams in commercial lamb programs.

In Table 3 the mean scores are shown for the degree of competencies in swine marketing needed and possessed as indicated by the livestock producers. The mean scores were 4.0 (much competence needed) or higher for the abilities: to figure feed cost of a 200# hog, to figure feed conversion of pigs above 200#, to select the market which gives the best net return, to have adequate loading facilities for safe loading, to figure returns above costs, and the ability to evaluate methods of marketing and select the one giving the greatest return. These scores are revealed in Table 3.

Understandings needed with mean scores of 4.0 or higher for swine producers included understandings: of proper weight when selling hogs, of hog market trends and cycles, of ways of marketing hogs, of influence of heritability factors on market grade or dressing percentage, of influence of heritability factors on carcass quality and quantity in pork, of consumer demand for pork, of feed conversion as an animal goes above 210#, of livestock loss and the factors causing such loss, of meat substitutes and their overall effect on hog production, and of year end marketing effect on net profile.

Table 2. Degree that sheep marketing competencies were needed and possessed by selected producers by major livestock enterprise

Competencies	Mean scores					
	N=16 Beef		N=79 Sheep		N=28 Swine	
	Needed[a]	Possessed[b]	Needed[a]	Possessed[b]	Needed[a]	Possessed[b]
Ability to:						
Do a good job of buying lambs	3.9	2.4	4.5	3.9	4.0	2.2
Determine when to sell lambs to produce a desirable meat carcass	4.0	2.4	4.3	4.0	3.8	2.5
Select market giving best return	3.9	2.7	4.3	2.5	3.8	2.5
Grade sheep ready for market	4.0	2.4	4.3	3.9	4.0	2.3
Estimate weight of lambs	3.8	2.8	4.2	3.9	3.8	2.6
Estimate shrink to marker	3.8	2.3	3.9	2.6	3.8	2.1
Sort lambs by weight and grade	4.2	2.3	4.3	3.8	3.9	2.2
Figure feed conversion	4.2	4.2	4.1	2.5	4.0	2.3
Figure feed cost per pound of gain beyond 90#	3.8	2.6	3.9	3.4	3.9	2.5
Figure returns above costs	4.2	2.9	4.3	3.9	3.8	2.5
Feed to minimize shrink	3.5	2.4	4.2	3.4	3.7	2.1
Determine marketing method giving greatest return	4.1	2.7	4.3	3.7	3.7	2.6
Overall mean scores for abilities	3.8	2.7	4.3	3.6	3.9	2.2
Understandings of:						
Sheep market trends and cycles	4.1	2.2	4.2	3.6	3.6	2.4
Natural love for sheep	3.9	2.4	3.8	4.2	4.0	2.1
Grading of wool and its effect upon gross income from sheep	4.2	2.3	3.9	2.5	3.9	2.3
Factors influencing price of wool	4.1	2.3	4.2	3.4	3.7	2.2
Wool pools and their long-range effect on your wool income	4.1	2.2	4.0	2.9	3.9	2.1
Lamb and wool promotional programs and their effect on prices	3.4	2.1	4.1	3.5	3.9	2.4

[a]5--very much competence needed, 4--much competence needed, 3--some competence needed, 2--little competence needed, 1--no competence needed.

[b]5--very much competence possessed, 4--much competence possessed, 3--some competence possessed, 2--little competence possessed, 1--no competence possessed.

Understandings of:						
Religious customs influence on lamb demand	3.8	2.1	3.8	3.2	3.7	2.1
Consumer demand for lamb	3.8	2.2	4.6	4.0	4.1	2.3
Government wool support programs	4.1	2.7	4.4	4.2	3.6	2.4
Feed additives as related to carcass quality	3.9	2.0	4.2	4.0	3.9	2.1
Livestock loss and factors effecting such loss	4.1	2.3	4.4	4.1	3.8	2.3
Carcass cut-out information	3.3	2.0	4.3	4.3	3.9	2.1
Importance of meat-type rams in commercial lamb programs	4.1	2.3	4.2	4.0	4.0	2.7
Overall mean scores for understandings	3.8	2.2	4.1	3.7	3.8	2.3

Table 3. Degree that swine marketing competencies were needed and possessed by selected producers by major livestock enterprise

Competencies	Mean scores					
	N=67 Beef		N=50 Sheep		N=81 Swine	
	Needed[a]	Possessed[b]	Needed[a]	Possessed[b]	Needed[a]	Possessed[b]
Ability to:						
Estimate market grade of a hog	3.9	3.4	2.9	1.4	4.0	1.6
Estimate backfat thickness of a market hog	3.9	2.8	4.0	2.8	3.8	3.1
Figure feed cost of a 200# hog	4.1	3.5	2.3	3.5	3.8	3.7
Figure feed conversion of pigs above 200#	4.0	3.3	4.1	3.6	4.3	3.5
Select market which gives best net return	4.1	3.7	4.5	4.0	4.1	3.8
Select a trucker for safe marketing	3.6	4.0	3.9	4.0	3.4	3.8
Have adequate loading facilities for safe loading	4.1	4.2	3.9	4.1	3.6	4.0
Prepare transporting vehicle for safe hauling of hogs	3.7	4.0	3.9	4.1	3.5	3.8
Load carefully to minimize shrink	3.8	4.0	4.0	4.2	3.6	3.8
Figure returns above costs	4.2	3.8	4.2	3.8	3.9	3.7
Evaluate methods of marketing and select one giving greatest return	4.1	3.6	4.2	3.7	4.2	3.7
Overall mean scores for abilities	3.8	3.9	3.8	3.6	3.8	3.5
Understandings of:						
Value of meatiness in a hog carcass	3.9	3.3	4.2	3.5	4.0	3.6
Proper weight when selling hogs	4.0	4.0	2.6	3.9	3.9	4.0
Hog market trends and cycles	4.0	3.1	4.2	2.6	3.9	3.4
Ways of marketing hogs (by weight, grade and yield and sort)	4.0	3.7	4.3	3.7	3.9	3.9
Carcass cut-out information	3.8	3.0	4.1	3.0	3.8	3.3

[a]5--very much competence needed, 4--much competence needed, 3--some competence needed, 2--little competence needed, 1--no competence needed.

[b]5--very much competence possessed, 4--much competence possessed, 3--some competence possessed, 2--little competence needed, 1--no competence needed.

Table 3. (continued)

Competencies	Mean scores					
	N=67 Beef		N=50 Sheep		N=81 Swine	
	Needed	Possessed	Needed	Possessed	Needed	Possessed
Understandings of:						
Influence of heritability factors on market grade or dressing percentage	4.0	2.9	3.9	3.1	4.1	3.4
Influence of heritability factors on carcass quality and quantity in pork	4.0	3.2	4.2	3.1	3.9	3.4
Consumer demands for pork	4.7	3.2	4.1	3.3	4.0	3.2
Feed conversion as an animal goes above 210#	4.1	3.3	4.1	3.4	4.0	3.5
Livestock loss and the factors causing such loss	4.1	3.5	4.2	3.6	4.0	3.5
Transportation and feeding to minimize shrink	3.6	3.6	4.0	3.6	3.6	3.2
Meat substitutes and their overall effect on hog production	4.2	2.9	4.0	3.1	3.9	2.8
Year end marketing effect on net profit	4.0	3.3	4.0	3.3	3.9	3.4
Overall mean scores for understandings	4.1	3.3	4.0	3.3	3.9	3.4

Beef producers indicated, as shown in Table 1, that they possessed more competency than needed in the abilities: to sell cattle when they are ready for their grade, to prepare cattle for shipment, and to select a trucker on livestock hauling reputation. The mean scores shown in Table 2 indicate that sheep producers did not feel that they possessed more competency than needed but did feel that they possessed as much ability as was needed to figure feed conversion. Information given in Table 3 indicates that swine producers felt that they possessed more ability than needed to select a trucker for safe marketing, to have adequate loading facilities for safe loading, to prepare transporting vehicle for safe hauling of hogs, and to load carefully to minimize shrink.

Differences between overall mean scores for abilities needed and possessed were .5 for the beef producers, 1.1 for the sheep producers, and .1 for swine producers. The differences that existed between the groups for understandings needed and possessed were .5 for the beef producers, 1.6 for the sheep producers, and .8 for the swine producers.

The differences between overall mean scores for competencies needed and possessed were .6 for the beef producers, 1.0 for the sheep producers, and .2 for the swine producers.

Comparisons among groups showed the following differences between the total overall mean scores for competency needed and possessed: (1) Younger livestock producers had wider differences than older livestock producers. (2) Livestock producers with fewer years of experience had wider differences than those with more experience. (3) Sheep producers with more formal education, had wider differences, whereas beef producers with less formal education, had wider differences. (4) Increased years of vocational agriculture tended to decrease the differences. (5) Men without training in livestock production in young farmer, adult evening class or veterans on-farm training had wider differences than those who had had such training. (6) Those with the smaller size of livestock enterprise tended to have the wider differences, except in the case of sheep producers where the reverse was true. (7) Producers who had grade and combination livestock tended to have wider differences than purebred and crossbred producers.

Correlations were found between age and years of farming experience (+) and age and years of vocational agriculture (-), years of farming experience and educational level attained (-). In beef marketing, both age and years of farming experience were correlated with scores for the degree of understanding needed of county, state, and national beef promotional organizations. One competency was found correlated with a control factor in sheep marketing; it was the age of the farmer with scores for understanding needed of livestock loss and factors effecting such loss (+). Four control factors were correlated with competencies needed in swine marketing. They were age of farmer and years of farming experience with scores for the ability needed to select the market which gives the best return.

When scores for the degree of competencies needed in 18 selected competencies were correlated with the scores for the competency possessed in the same 18 competencies, four were found to be significant at the 1 percent level and five were significant at the 5 percent level.

There seemed to be a high positive correlation between scores for the abilities needed to do a good job of buying and marketing lambs, to understand consumer demands for lambs, to evaluate the carcass of lambs, to estimate market of hogs, and to figure returns above costs with number of hogs marketed.

Implications

There were 23 competencies selected as being needed for success in beef marketing, 25 in sheep marketing and 19 in swine marketing. It is important that these 67 competencies be considered carefully in planning training programs for present and prospective beef, sheep and swine producers. They should form the basis for livestock marketing instruction in vocational agriculture classes for high school youth, for young farmers; and for adults; in the cooperative agriculture extension program; in area vocational schools; in junior colleges with post-high school programs in off-farm agricultural occupations; and in the College of Agriculture resident instructional programs.

These competencies should be emphasized in providing in-service training for present livestock producers. In-service training should be offered specifically in vocational agricultural departments, in the cooperative extension programs, in area vocational-technical schools, and in junior colleges offering training in off-farm agriculturally related occupations. This training would greatly improve the efficiency of livestock producers, improve their ability to market more efficiently, and produce the amount and quality of livestock products available to consumers.

*ON THE JOB TRAINING; *PROGRAM DESCRIPTIONS
IOWA

The Iowa State Manpower Development Council, started in July 1965, operated as an experimental and demonstration project of the United States Department of Labor. Its purpose was to coordinate a number of manpower programs and to strive for maximum development of human resources. Since December 1965, the Council has administered a statewide On-The-Job Training program (OJT). During the training period, from 8 to 26 weeks, the trainee was paid a regular salary for his position, and the employer was reimbursed up to $25 per week for teaching the new skills. In 1966, the OJT program served 600 trainees and 188 employers. Of these trainees, 411 completed training. Trainees included the young, the not-so-young, and the socially or physically handicapped from both rural and urban backgrounds. They were referred to the OJT program from public and private agencies. The 1967 OJT Program allocated $280,670 for 262 trainees. In addition, the Council, Employment Service and vocational education cooperated in initiating and planning classroom training programs for 384 of the trainees. Combining OJT and classroom programs should lower total manpower training costs and increase the quality of training and skill development. A summary of trainee characteristics and a sample training certificate are included. (EM)

ON-THE-JOB-TRAINING

The Story of

Iowa

NEW SKILL TRAINING

Since December of 1965 the Iowa State Manpower Development Council has administered a statewide On-The-Job Training program. This is one of the easiest of all federal programs to explain. In OJT a person is placed on the job for training in a new skill. At the end of the training period—from 8 to 26 weeks—the trainees who successfully learn new skills are retained by the employer as a regular employee.

During the training period the trainee is paid a regular salary for his position, and the employer is reimbursed for teaching the new skills—up to a maximum of $25 per week.

The Iowa State Manpower Development Council is an experimental and demonstration project of the United States Department of Labor. It was started in July, 1965 and was to operate for 18 months. Because of the success of the Manpower Development Council, the U. S. Labor Department has continued its contract until December, 1967. As a state agency, it operates out of the Office of the Governor.

Purpose of the Council is to cordinate the vast number of manpower programs in Iowa and to strive for the maximum development of human resources in the state.

Very little of Iowa's allocation of OJT funds were being used prior to the establishment of the Manpower Development Council. Now, all allocated funds are being put to use.

Money for OJT and other programs under the Manpower Development and Training Act comes from the Bureau of Apprenticeship and Training—part of the Manpower Administration of the federal Department of Labor.

OJT is the least expensive of all federal training programs, and the cost per trainee in Iowa during 1966 was the lowest in this region.

When OJT first was introduced as a national program, large numbers of trainees were assigned to large manufacturing concerns. The program in Iowa has focused on the needs of the individual, and only a few trainees—sometimes only one—have been placed with any particular employer. The small businessman has benefited from this aspect of the program.

The Manpower Development Council was originally granted $100,908 to place 200 trainees in four areas of Iowa during 1966. The program moved faster than anticipated, and the grant was increased to $266,319 to provide training for 500 Iowans, and extended to the entire state.

The OJT program in 1966 served a total 600 trainees, and 188 employers. Of the total number of trainees, 411 completed training successfully and are now taxpaying members of the Iowa labor force.

Mrs. Helen Thomas is training under OJT as an auto mechanic at Langwith Motors in Davenport. "I enjoy the work and making my own way," says Mrs. Thomas. Kenneth Stringer, vice president of the auto firm says, "I think this is an excellent way of helping people to enter or re-enter the labor market."

WHO ARE THE TRAINEES?

The trainees embrace a wide cross section of young men and women, and those not so young. Some are handicapped because of social barriers, some because of physical limitations. Some are from rural backgrounds. They have in common a record of unemployment or underemployment. All need new skills to enter the labor force, some need employment counseling.

Trainees are referred to the OJT project from many public and private agencies. They are referred from Employment Service, from various welfare agencies, from Vocational Rehabilitation, some have been automated out of their previous jobs.

An attempt is made to place each trainee in a position where he will do well, and one which he will like—and one which will be satisfactory to the employer.

An appendix at the end of this report shows some of the characteristics of the trainees.

These two young men received certificates of successful training completion from Don Dripps of the Vinton Concrete Crib and Silo Company. They were among the first placed on OJT in Iowa.

'67

LOOK TO THE FUTURE

The Manpower Development Council is now operating the OJT project under a new contract for 1967.

While there are some new aspects of the program, designed to get more training per dollar and to utilize other federal training programs, the emphasis is still the same: help the individual gain better marketable skills, and to help the employer meet job shortages.

> A State Manpower Coordinating Committee has been established to improve planning, coordination, and programming of all manpower programs in Iowa. Under this committee are 16 Area Manpower Coordinating Teams in 16 areas of the state. The local teams meet to make sure each trainee is given an opportunity to benefit from as many different programs as he needs to enter the labor force at his best level. A major function of the area teams and the state Committee is to avoid overlap and duplication of effort.

Team representatives include among others, men and women from Community Action Agencies, Neighborhood Youth Corps, Employment Service, Manpower Development Council, Vocational Rehabilitation, and Vocational Education and Welfare Agencies.

The 1967 OJT program allocates $280,670 for On-The-Job Training for 262 trainees. In addition, the Manpower Development Council will share with Employment Service and Vocational Education the responsibility for initiating and planning classroom training programs for 384 of the 662 allocated slots for trainees.

Classroom programs have been alloted $139,400 for instructional costs and equipment, and $86,480 for trainee allowances.

These coupled programs will enable a trainee to take some classroom work—to brush up—prior to being placed on the job for further skill development.

It has been the experience of those in manpower fields that straight classroom training costs are rather high (about $1,200 per trainee), in comparison with the average OJT cost of $504.

On the other hand, it has been also noted that some OJT trainees meet with frustration because of a lack of education and experience.

The solution, it seems, is to combine classroom and OJT programs—both to lower total manpower training costs and to increase the quality of training and skill development.

These students are supervised in classroom-type situations at the Manpower Development and Training Act facility in Des Moines. After completion of classroom and practical work, some of these students will be placed in new jobs, others will be placed in On-The-Job Training positions for further skill development before becoming regular employees. The coupled-program approach is new in Iowa.

Larry Netten gets training from Mrs. Milo Miller in the operation of a Linotype machine at the Keota Eagle newspaper office in Keota. Larry is being trained as a printer's helper in a variety of tasks. Paper is published by R. F. "Bob" Beck.

Two OJT trainees are shown working in a ward of the Soldiers Home in Marshalltown. Both had sight problems which proved a barrier to employment. At right is Linda Watson. Turning crank on hospital bed is Arthur Hays. They are orderlies. They may be trained as practical nurses later.

Two more OJT trainees who have had successful training at the Soldiers Home in Marshalltown are Kathy Harper and Hank Grapes. Age and lack of experience can be handicaps to full employment without additional training. Besides training people for new work, OJT has helped fill critical jobs—like orderlies in hospitals.

Charles Elsinger is receiving training as a Machine Operator at Mo Re C., Inc. Council Bluffs, Iowa. Mr. Elsinger is married and has five children. Lacking a saleable skill he had difficulty finding suitable employment before entering OJT.

Fred Romans of Council Bluffs is receiving training at Best O' Service in automotive repair. All OJT trainees are placed in "demand" occupations to insure future employment.

World Radio Laboratories, Inc. of Council Bluffs is training Virginia Fairchild in the growing field of electronics. Miss Fairchild is shown here explaining her work-related training to Mrs. Evelyn Villines, of The Iowa Commission for the Handicapped.

UNIQUE ASPECTS OF OJT IN IOWA

On the map on the preceding pages the shaded areas indicate the individual territories of OJT job developers and the large black circles point out the location of Area Manpower Coordinating Committee Centers.

Unlike most OJT programs throughout the Country which are confined to a particular metropolitan area, the Iowa Manpower Development Council's OJT contract covers the entire state of Iowa. Any public or private agency in Iowa concerned with the development of human resources can call on the Council to develop an OJT program for their clients who are in need of job training. The job developers can then negotiate a training sub-contract with qualified Iowa employers in any Iowa community.

In addition to their job development and training program evaluation activities, the Council's OJT staff has taken a leadership role in the development of the 16 Area Manpower Coordinating Committees. These 16 area committees, centered on the Area Vocational School, have the goals of assessing area manpower needs in order to develop coordinated planning at the state level, of informing each agency of the services available from individual agencies in the area, and of keeping all area agencies informed of future plans in order to prevent duplication of effort.

RECOGNITION

Trainees satisfactorily completing training deserve recognition. In fact, for many, the certificate awarded constitutes the first symbol of accomplishment they have ever received.

The certificate, shown on the back cover page, bears the signature of the Governor, the Director of the Manpower Council and the employer's training representative who recommends the trainee for "graduation."

INTRODUCTION

A number of significant factors led to the Department of Labor's decision to call the first conference ever held on the manpower and training needs of the food service industry. Labor, management, trade and professional associations, and several Government agencies have had a longtime concern about the continuing and increasing shortage of trained workers in the food service industry. Widespread interest was being expressed in the resources available for training food preparation and service workers under the Manpower Development and Training Act and the Area Redevelopment Act. Information was needed about the changing occupational structure and employment patterns of this industry and their implications for training. The development of sound programs to prepare and upgrade food service workers to meet the industry's changing manpower requirements called for direction and cooperative action.

The Department of Labor therefore invited representatives of education, management, unions, trade and professional associations, and Government agencies to a conference in Washington on April 22-24 to explore some new approaches to meeting present and future manpower and training requirements of the food service industry. Some 140 persons participated in the conference.

The planning committee for the conference was composed of representatives of the Office of Manpower, Automation and Training, the Bureau of Employment Security, and the Bureau of Apprenticeship and Training of the U.S. Department of Labor; the Division of Vocational and Technical Education, Office of Education, U.S. Department of Health, Education, and Welfare; the National Restaurant Association; and the Hotel and Restaurant Employees and Bartenders International Union.

This report contains highlights of conference presentations, work group discussions, and recommendations. It was prepared by Mary S. Resh, Special Assistant to the Director, Office of Manpower, Automation and Training, U.S. Department of Labor, who served as Conference Coordinator.

U.S. Department of Labor

ADDRESS OF WELCOME

The Honorable John F. Henning, Under Secretary of Labor, greeted the conferees and expressed the appreciation of the Department for their attendance at the conference. He said: "The food service industry is very important to our economy and is one with which we are greatly concerned in terms of manpower development. We are entering a period of manpower consciousness and manpower planning, and in our Manpower Report, which is an historic document of 2 years' experience with the Manpower Development and Training Act, President Johnson has called for an Active Manpower Policy that will (1) develop the talents and skills of the American people; (2) be concerned with the creation of jobs and development of employment opportunities; and (3) match workers with jobs.

"An Active Manpower Policy and the changing occupational structure of the food service industry have implications for training and employment in your critical industry.

"Under the Manpower Development and Training Act, over 130,000 unemployed and underemployed persons have enrolled for training to date. The success of the program can be measured by the extent to which it has moved unskilled persons into semiskilled and skilled jobs. More than 70 percent of those who have completed training have been placed in jobs. Training is not given for the mere sake of training but is related to the needs of the job market.

"In our history we can point to two singular acts designed to develop our manpower resources--the Vocational Education Act and the Apprenticeship Act. It is time that we give more attention to the direction of worker training so that management, labor, and the Nation might benefit by the merger of abilities of these three constituent groups. I hope we can move toward meeting the manpower needs of your industry and the training needs of those who would find employment in your industry."

"AN OVERVIEW OF THE FOOD SERVICE INDUSTRY"

Summary of Address by: Donald Greenaway
Executive Vice President, National Restaurant Association

Every political, labor, and business leader should look over the shoulders of the American people into the three panels of the good citizenship mirror. In one panel they would see the faces of 188 million American consumers. In another panel, they would find 71 million of these people who are earners in our society. These earners include management, proprietors, and 17 million members of labor unions. In the third panel, there would be reflected the 120 million Americans who are investors, including 16½ million adults who are direct stockholders in at least one corporation.

We are here to consider a problem which is essentially national and which requires the close cooperation of all American leadership, if solutions are to be found. The problem, like the mirror, also contains three panels. We are all concerned with the problem faced by the American people of increasing the total number of jobs during the balance of this decade and into the future. We are conscious of the problem of chronic unemployment, even at the level of peak prosperity in this country. We are also aware of dislocations, wherein some jobs are unfilled while pockets of unemployment continue to exist.

The food service industry, as we know it in 1964, is a vast, sprawling, beehive of businesses, private and municipal activities, and Governmental subdivisions. We in the National Restaurant Association know most about the public-for-profit restaurant segment. We know less about the non-public private food service activities which occur in private clubs, hospitals, schools, military establishments, and so on. We know least about food service in prisons, inmate establishments, publicly owned hospitals, rest homes, and a vast array of activities carried on through Government administration and ownership.

These three broad categories can provide employment for an additional 75,000 to 100,000 people who will be in new positions each year in this decade. In addition, perhaps 150,000 replacements to our industry's labor force will be needed each year, at least during the remainder of this decade. In substance, therefore, this means a minimum of 150,000 jobs and possibly a maximum of 350,00 jobs.

We can count on basically 50,000 new jobs per year in public-for-profit restaurants, provided the following circumstances prevail:

1. That the American consumer will continue to spend an additional $750 million every year for food and beverage eaten away from home.
2. That business investors can be found who will spend $2,500 for each new job created.
3. That the fine balance between wages paid and productivity are not altered disproportionately with price increases which are beyond those obtainable from the consumer.

Employment in the other two-thirds of our industry would indicate that there are about 300,000 food service employees in hotels, motels, and tourist courts. The Department of Agriculture reports that there are 70,000 school lunch programs in the United States with about 100,000 to 150,000 full-time employees and at least double the number of part-time workers. Hospitals are presently employing 250,000 to 300,000 food service workers. Schools, colleges, clubs, religious institutions, amusement installations, retail establishments, and other categories employ in excess of 150,000 full-time workers. We can therefore account for employment of some 3 million proprietors, owners, and paid workers in the food service field.

The nonpublic institutional side of the food service industry is also expanding. This segment of food service will need 25,000 to 50,000 additional workers each year if present trends continue in expansion of hospitals, colleges, private clubs, and other related areas.

Employment within restaurant units is tending to shift upward. Capital accumulation and higher volumes are necessary in order to assure success, and these trends will be a favorable factor in future employment in the industry. There is little indication that public favor will be given to restaurants which completely automate their services and eliminate personalized attention from waiters and waitresses. There is, however, a strong indication that dishwashing, work in the maintenance area, to some extent food preparation, and clerical and office functions, will be the first areas in which automation will be felt.

It is safe to predict increasing needs for highly trained business personnel and merchandising-oriented management. It is safe to predict that we will need more and better supervisors. Present and future developments in structured education will meet the demands for these people in the future.

The Labor Department has estimated that about 40 percent of the food service industry work force is made up of waiters and waitresses; 35 percent are cooks of various categories; the balance are miscellaneous workers, such as management, maintenance, and so on. Based on these figures, the big expansion in jobs will come in about the same proportion in the skilled categories. This would mean that of the 50,000 new jobs which will be created each year, we will need 20,000 to 25,000 waiters and waitresses each year and 15,000 to 20,000 cooks in various categories.

In the nonpublic segment of our industry the pattern of need is somewhat different. Here we will have a need for many more miscellaneous workers, fewer waiters and waitresses, and about the same number of cooks.

It has long been believed that our industry has extreme instability from the point of view of employee turnover. Exaggerated statements claim that anywhere from one-third to two-thirds of the total employees change jobs annually. This assumption is grossly inaccurate. About 10 percent of the

jobs in the public segment are developed because of seasonal expansion within year-round establishments. This means about 180,000 jobs cannot be supported except on a seasonal basis. Additionally, tens of thousands of jobs are less than year-round jobs because they are located in seasonal establishments. There are great numbers of students, housewives, and others who cannot work more than part time, and often only a few hours per week. If these figures are used in computing turnover, an exaggerated picture would emerge.

The service industries cannot expand and contract employment as retail and manufacturing businesses can. This is one of the reasons why productivity of restaurant employees remains relatively low. It is also one of the reasons why restaurant employers will probably demand higher levels of skill and customer orientation from their full-time employees.

Those who deal with placement for various industries often erroneously conclude that people who are unsuited for other jobs, such as in retailing and industry, can be used effectively in the service fields. Sometimes they can, but more often they cannot. A completely untrained, unindoctrinated restaurant employee accelerates into efficiency rather slowly. A waiter or waitress may take from 1 month to 1 year to train, depending on the type of service; a cook may take from 2 months to 2 years to train on the job.

A large segment of the restaurant industry is not of sufficient size to do good on-the-job training for completely new employees. Only the very large and multiunit companies have personnel and training programs. You may conclude that the Manpower Development and Training Act can assist by supplying off-the-job and on-the-job training for a large portion of the 75,000 new jobs that will be filled each year. However, future restrictions in employment opportunities for young people, female minors, and women in this industry bear examination when training programs for potential food service workers are organized.

The Manpower Development and Training Act has already demonstrated in small ways that it can serve the Nation's unemployed in a meaningful way. Likewise, with industry and labor cooperation, the Manpower Development and Training Act can serve our field of business. The job ahead is to establish many more programs in all sections of the country. We must join together to successfully accomplish this worthwhile objective.

"LABOR LOOKS AT THE INDUSTRY'S NEEDS"

Summary of Address by: Myra K. Wolfgang
Vice President, Hotel and Restaurant Employees
and Bartenders International Union

The wide variety of requests made of Government agencies for training programs, and the even greater variety of needs, have created a multitude of problems. Should the industry seek new trainees, upgrade present employees, or both? Should the training be academic in nature, on-the-job training, recognized apprenticeship programs, or all three types? How do we recruit people into the industry? What does the future hold for both employer and employee? It will take an honest and frank appraisal of these problems, if the industry's manpower needs are to be met successfully.

There are nearly one-half million organized hotel and restaurant employees in this industry. There are nearly 400,000 hotels, motels, and restaurants in this Nation, employing nearly 2 3/4 million workers. Sales are over $18 billion a year. Food purchased by the industry in 1 year cost over $460 million.

The industry is big, it continues to grow, and accompanying this growth are dislocations caused by automation and by the ever-changing living and traveling habits of the American people. The decline of the hotel and the rise of the motel, the growing disappearance of the independent operator, the growth of the automat, the vending machine, the pre-packaged meal, have been greeted with cries of disaster. The inefficient, the visionless, the timid, the under-financed, wail about our industry being a sick industry, a marginal industry, a mom and pop industry, but like everything else in dynamic 1964, the industry is changing.

Sales in the country's restaurants have increased steadily since the $16½ billion mark in 1961. Profits have been high, and profits of the chain-operated segment the highest. A study of this industry made by the Department of Labor revealed that over 52 percent of the employed are working in enterprises with sales of $1 million a year or more, and the majority of them in chain operations. The same survey showed that the larger the enterprise, the greater the net profit. The average rate of profit in the industry is 2 percent, yet establishments which gross over $1 million a year average 4.8 percent; those with assets of between $5 million and $10 million a year average 6.6 percent.

Profits have been good, and the hotel and restaurant industry pays its supervisors and executives quite handsomely! Of 51 basic industries, according to Herbert K. Whitsky & Associates, hotels ranked 11th in salaried paid executives, but employees were in forty-sixth place.

Repeated requests for Federal funds to train people for this industry have been made. The Government has manifested a willingness to provide such aid but funds are not gigantic pork-barrels available for selfish exploitation but for training to serve the needs of our total economy. The general public is already subsidizing the industry with public welfare payments. Because of low wages, many full-time workers in the service industries are receiving direct relief, Aid to Dependent Children, and surplus commodities to augment their income. There is another subsidy called "tipping". To force some employees to hustle tips and curry favors to maintain a minimum standard of living is an indignity that disgraces those who impose it and discourages others from seeking employment in the industry. Employers do not add gratuities to earnings for social security purposes: only the base wage is used for determining benefits. The retirement income for those who receive a portion of their income from gratuities is dangerously near the minimum level. Thus, the tipped employee suffers a deprivation while gainfully employed, another when retired.

We believe in training, but we feel that it is time for the industry to raise the level of wages paid to the majority of their employees before asking the Federal Government to train people for them. There is no question about the serious shortage of skilled labor in this industry, but paying substandard wages will not ease this shortage. Training programs should be denied where there is organized opposition to the payment of a living wage.

The lack of status in the food service industry is an additional reason for our labor shortage. The public incorrectly pictures the waiter and the waitress as servants rather than as people giving service. We work when others in the community are off--through meal hours, on holidays, on Sundays--this makes us seem different, affects our social lives, and discourages many from remaining in the industry.

A national triparty committee composed of management, labor, and Government should be instituted for the purpose of improving the public image of people working in our industry. The entire promotional ladder should be opened up to all, regardless of race, religion, or national background. It must be made manifestly clear to the American people that the hotel and restaurant industry is open to the native born as well as the foreign born, the Negro American as well as the white American; the only factor that counts in gaining employment is the specific job requirement; the only thing that counts in promotion is ability and seniority. The public must be taught that the industry is a place where Americans can earn a good living, in dignity and with honor.

Immigration laws have stopped the flow of foreign-born people into the hotel and restaurant industry, but hundreds of thousands of high school graduates who have no desire for college education, as well as hundreds of thousands of high school dropouts, can be induced to come into the industry.

We must establish a national comprehensive training program for all categories within the hotel and restaurant industry, making available the latest information on technical skills necessary to do the job efficiently and effectively.

Our unions feel that the most desirable type of training program is upgrading the skills of those already employed in our industry. However, we do not, and will not, take the narrow view that only this type of training is acceptable. The average age of the unskilled kitchen worker in the Detroit area, for example, is 50 years. Can we seriously consider upgrading a 50-year-old man or woman to try to teach him or her new skills and expect to be successful? How can we consider a program for upgrading bus boys when we have no bus boys to upgrade? One city may find it more feasible to recruit new people into the industry, while another may find it advisable to upgrade currently employed people. The policy must vary from city to city, depending on employment conditions. Flexibility must prevail. Our International Union, the largest union of service workers in this country, recognizes the need for intelligent, well-oriented, well-conceived training programs, whether they be on the apprenticeship level, whether they seek to upgrade people, or whether they train new people for entry jobs in the industry.

The late Mayor LaGuardia once remarked: "When I come home at night my wife never asks me what important documents I signed that day, or what statue or bridge I dedicated, or to what distinguished visitor I presented the key to our great city. No, her first question is always 'What did you have for lunch?'" Unless something is done to train cooks, and train them properly, to train waiters and waitresses, then the future Mayor LaGuardias will either be eating from vending machines or bringing their lunches with them. This will be most unfortunate. Let us then formulate, plan, and develop programs to meet the challenge of our times.

"TRAINING--THE MANPOWER CATALYST"

Summary of Address by: Edwin L. Rumpf
Assistant Director, Division of Vocational and Technical Education, U. S. Office of Education

"You won't get tomorrow's jobs with yesterday's skills." That is a hard truth faced by millions of Americans today. "Train now for tomorrow's jobs," is a timely warning and sound advice aimed at present and potential members of the labor force, but they are also highly significant words for educators.

Educators must act now to make up for past years of neglect, to help solve the manpower problems of today, and to prepare for the years ahead.

When you consider the vast forces of social, economic, and technological change at work in our society, you realize what a tremendous task we educators face.

The times have caught up with us. The cry everywhere is for training, now! Dedicated vocational educators throughout the Nation, handicapped over the years by little public support and inadequate facilities, stand ready to meet the demand for training. Through the years, our vocational education system has trained millions of workers to man the machines of industry. During times of national crisis--the depression years, World War II, and the Korean War--vocational educators stepped up their efforts, adding millions of men and women to the manpower force needed for recovery and victory. Despite handicaps and shortcomings, the record of vocational education in recent years is impressive. Intensive 2 year training programs have been turning out more than 12,000 new technicians annually in the past 3 years. In addition, about 400,000 workers in skilled trade and technical jobs have been enrolled in upgrading and refresher courses. Last year 2,009,088 students were enrolled in high school level vocational courses and 98,154 were in post-high school classes. In addition, 2,123,122 adults were participating in various kinds of vocational training courses. Under the Manpower Development and Training Act and the Area Redevelopment Act, 93,878 trainees have been enrolled in 1,684 projects to date.

Training is the catalyst that can release the potential of our human resources and speed the process of matching people to jobs. I see vocational educators as middlemen. On the one hand, they must help prepare job-seeking workers who lack the skills for economic survival in an increasingly competitive labor market. On the other hand, educators must respond to industry's continuing call for workers with higher levels of skill and training.

Of the millions of workers now in the labor force, a large percentage will need training to keep up with developments in their fields. Others will need retraining for related jobs or for new jobs. Retraining may be necessary as often as two or three times during a working lifetime. Industry needs workers who are flexible, workers who have a field of skills and basic education that will enable them to adapt rapidly to occupational changes. Workers who are adaptable make installation of new methods and equipment more economical for employers. Management needs workers ready to move into its jobs without long periods of preparation.

The capstone of our training structure is the Vocational Education Act of 1963, enacted by the Congress last December. It was hailed by President Johnson as". . . dramatic evidence of our commitment to education as the key to our social and economic and technological and moral progress . . ." The act opens a new era in vocational education, breaking down the rigid categories imposed by the earlier laws. It authorizes a direct attack upon unemployment by permitting the establishment of programs tailored to

need rather than programs geared to preset formulas which may become out of date. It enlists educators and citizens in support of a total effort to bring vocational training into harmony with economic reality. The law, in the first full year of operation, would triple the Federal financial commitment to vocational education and authorize even more support in the future. Most important to you here, it calls for cooperation on a scale never before realized. National, State, and community leaders from business, labor, and the professions, and representatives of Federal, State, and local governments are called upon to assess and plan programs to meet job needs.

We now have at our disposal the means to support vocational training anywhere and in virtually any occupation, short of the professional level, for which there is a need. In other words, we are ready to help you solve almost any of your manpower problems. But as President Johnson stated in his 1964 Manpower Report to Congress: "The Federal Government can provide leadership, information, and other assistance, but fundamentally it is action carried forward in each community that will decide how well we achieve national objectives. An Active Manpower Policy cannot be a responsibility of the Federal Government alone. Business, labor, and all private groups and institutions, along with State and local governments, have vital roles to play."

We in vocational education have the basic means to assure that the Nation's manpower training needs are fulfilled in this time of revolutionary change. But our tools and our determination to serve are nothing more than potential weapons unless you advise us of your needs, unless the request for action comes from you, and unless we have your full support.

SESSION II

SUMMARY OF PRESENTATIONS

ON

TRAINING RESOURCES

SESSION II - TRAINING RESOURCES

Chairman: Earl M. Bowler
Chief, Professional Services Section, Manpower Development and Training Program, U.S. Office of Education

"PUBLIC DISTRIBUTIVE EDUCATION PROGRAMS"

Digest of Presentation by: John Beaumont
Director, Distributive Education Branch
U.S. Office of Education

Distributive education is a program of vocational instruction in merchandising and marketing. In the past, these programs have been limited by legislation to employed persons. The Vocational Education Act of 1963 changes this requirement and beginning in Fiscal 1965 will permit enrollment of persons who are preparing for distributive occupations. This report, however, relates to training of employed persons.

Distributive education programs are conducted by State boards of vocational education in the 50 States and 4 Territories through various educational institutions. There are programs in secondary schools, in junior and community colleges, and in all kinds of public institutions offering adult education.

In regard to distributive education courses for the food service industry, States reported in fiscal 1963 enrollments of 30,332 persons employed in eating places and 7,531 in hotels. Most of these enrollments were in adult education programs. There are very few distributive education enrollments in food service programs at the secondary level, but adult courses were conducted for waitresses and waiters, cashiers, hostesses, supervisors, and managers.

The States have developed curriculum materials for use in these courses. Some States, like Washington and Georgia, have developed very useful curriculum materials for a series of merchandising courses in the food service field. The U.S. Office of Education has published a bulletin entitled, Food Service Industry Training Programs and Facilities.

In addition to offering courses in the food service industry, many States have conducted courses in various aspects of tourist training. States with the largest enrollments in food service courses are usually most aggressive in promoting the tourist industry.

"PUBLIC VOCATIONAL AND TECHNICAL EDUCATION PROGRAMS"

Digest of Presentation by: Merle Strong
Acting Director, Trade and Industrial Education
Branch, U.S. Office of Education

The National Vocational Education Acts provide funds to the States and territories on a matching basis for the promotion, development, and operation of programs of vocational education and training of less than college grade. Programs under trade and industrial education cover a wide variety of occupations, including hotel, restaurant, institutional, and related occupations. These programs are intended to fit an enrollee for employment and are sometimes referred to as "terminal" because they are designed for persons who do not expect to work toward a college degree.

Classes organized and conducted under the Vocational Acts are under public supervision and control and are operated by local school systems, area schools, junior colleges, four-year colleges, or State departments of education.

One of the older occupational groupings for which training has been provided in trade and industrial education is the food trades. While the numbers trained are not great enough to meet the demand, the program is sizeable, being offered in more than 35 States. It included, for the last year that complete figures are available, 93 preparatory courses for adults. This is in addition to upgrading or extension type courses.

ENROLLMENTS IN TRADE AND INDUSTRIAL FOOD TRAINING PROGRAMS, 1962

CLASSES	TOTAL	MALE	FEMALE
Preparatory	7,157	4,093	3,064
Evening Extension	13,057	4,522	8,535
Apprentice	1,094	1,057	37
Cooperative	2,208	1,652	556
TOTAL	23,516	11,324	12,192

A successful vocational education program has the following characteristics:

1. The program is directly related to employment opportunities which are determined by school officials in cooperation with occupationally-concerned and competent individuals and groups.
2. Course content is confirmed or changed by periodic analyses of the occupations for which the training is being given.
3. Courses for a specific occupation are set up and maintained with the advice and cooperation of the various occupational groups concerned.
4. Facilities and equipment used in instruction are comparable to those found in the particular occupation.

5. Conditions under which instruction is given duplicate as nearly as possible desirable conditions in the occupation itself and at the same time provide effective learning situations.
6. Length of training and the total hours of instruction are determined by the requirements of the occupation and the needs of the students.
7. Training is designed to develop marketable skills, abilities, understandings, attitudes, work habits, and appreciations to enable the trainee to get and hold a job in a particular occupation.
8. Day and evening classes are scheduled at hours and during seasons convenient to enrollees.
9. Instruction is offered only to persons who need, desire, and can profit from it occupationally.
10. Teachers are competent in the occupation for which they are giving instruction and possess adequate professional qualification for teaching.
11. Vocational guidance, including follow-up of students who finish or drop out of a course, is essential.
12. Continuous research is an integral part of the program.

"APPRENTICESHIP TRAINING"

Digest of Presentation by: Hugh C. Murphy
Acting Administrator, Bureau of Apprenticeship and Training, U.S. Department of Labor

During the current decade, employment is growing faster in the service industries than in the production industries. Yours is an industry of service to the public. You are in an important position to strengthen our economy by expanding your services.

Your industry has a training problem in common with other industries. The food service industry in the United States is far behind Europe in training its chefs, cooks, waiters, meat cutters, and bakers. Apprenticeship has been the basic type of training in Europe for the various occupations in your industry, and it is equally applicable in this country.

Apprenticeship prepares youth for the skilled crafts or trades which require a wide and diverse range of skills and knowledge, as well as maturity and independence of judgment. The apprentice receives instruction and experience both on and off the job in all the practical and theoretical aspects of a skilled trade. As he progresses, he acquires new skills and masters the application of those already learned, and his wages advance at regular intervals.

The Bureau of Apprenticeship and Training promotes the establishment of apprenticeship and other on-the-job training programs and the improvement of existing programs. Its chief concern is with the employed worker who is learning a trade and who will, at the conclusion of this training, reach journeyman status. The Bureau does no actual training but serves as a stimulator and assists industry in establishing apprenticeship programs.

The 1960 census showed 108,000 bakers in this Nation; at that time there were 342 baker apprentices registered with the Bureau of Apprenticeship and Training. The number of registered apprentices had dropped to 273 in June 1962. As of June 1962, there were 1,622 butcher-meat cutter registered apprentices and only 48 cook registered apprentices. With the Hotel and Restaurant Employees and Bartenders International Union alone reporting 443,000 members, it is evident that a sufficient number of persons are not in training. The Executive Board of the International Union is to be commended for the policy on apprenticeship and training which it adopted in January 1963, but inquiry shows that few additional steps have been taken since then to implement that statement of policy to encourage training and skill upgrading opportunities.

There is a tremendous job ahead if the food service industry is to have an adequate supply of trained workers for its current needs and for future planning and expansion. It is not an impossible task if all of us--management, labor, and Government--recognize the problem and put forth our best efforts to meet it.

x x x x x x x x x x x x

"INDUSTRY TRAINING PROGRAMS"

Digest of Presentation by: Edwin J. Martin
Director of Sales, Fred Harvey Restaurants

The most important responsibility of any institution today is tomorrow! Our tomorrow in this industry will be a radically different one--changing, growing, increasingly competitive and, though automated, ever more dependent on people. Tomorrow's successful institutions will require the most effective utilization of our human resources.

Economists readily agree that the service industries will provide the greatest impetus to our economic growth during the 1960's and the brightest star by far in the service industry constellation is the business of commercial hospitality--currently a $20 billion market.

Total employment in this industry approaches 1½ million people. Nearly one-third of these are engaged in the area of culinary skill, traditionally a handicraft. Change is abroad in our centers of food preparation. Cooks

and bakers are required to make judgments on temperatures, time, measurements, taste, quality, and a myriad of other factors on the basis of intricate control instruments; materials technology in such fields as paper, plastics, metals, natural and synthetic fibres are being developed; equipment design and manufacture are embodying principles of thermodynamics, including radar and infra-red cookery; unique systems of product receipt and storage as well as new means of issuing and transporting materials, supplies, and raw, semifinished, and finished products are being developed; process and product innovations are refining flash freezing and freeze drying, dehydration, fabricated meat and related lines, mixes for soup, gravy, sauce bases, bakery goods, beverages, and other items--the Utopian age of "instant everything."

If automation looms in the not-too-distant future, what does it suggest for our people--employee relations--in the years ahead? The President's Advisory Committee on Labor-Management Policy in its recently released report on the problems and opportunities posed by automation, said that technological progress, through automation, is essential to the Nation's needs. This technological progress can and must be achieved without the sacrifice of human values. Achievement of technological progress without loss of human values requires both private and public action, consonant with the tenets of a free society.

No one would dispute that sacrifice of human values is too high a price to pay for material progress. Scientists and non-scientists alike must reconcile their needs and objectives. This blend of science with humanity is our insurance for the future. The specialist of tomorrow must be attuned not only to the technical requirements of our industry but also to the needs of those employed within it. As the liaison between the sciences and humanities, we must prepare ourselves to meet not only the demands of technical competence but also the even more crucial demands of managerial competence. Our adherence to the fundamental principles of human relations will foster a climate of teamwork and engender a spirit of pride and accomplishment.

Gains in productive and technical efficiency will, if we let them, extract a toll in human relations. Automation anticipates further refinement of job methods and breakdown of job duties and responsibilities as a means to improved individual proficiency. Personal job skills will necessarily be of a higher order. Tomorrow's dramatic improvements in lighting, ventilation, climate control, functionally-engineered equipment and facilities may prove to be a pyrrhic victory if we fail of progress in effective utilization of human resources. To compete and prosper, even to just survive, we must know how we must train. Training never ceases. It is as broad as all operations and procedures which can be improved through the behavior of people.

x x x x x x x x x x x

"UNION PROGRAMS"

Digest of Presentation by: Charles Paulson
Director of Organization, Hotel and Restaurant
Employees and Bartenders International Union

Local unions have complete autonomy and approach the matter of training on the basis of labor supply and the employers concerned.

Unions have been involved in the development of apprentice training programs for cooks, usually in big cities; in on-the-job training programs for cooks; and in institutional or combination institutional and on-the-job training programs. Schools generally cooperate with unions in developing pre-employment training programs; however, some do not.

Unions favor apprentice training for cooks and are opposed to training programs for unskilled persons prior to employment except where there is a proven dire need.

Labor, management, education, and Government must have a close and cooperative working relationship in order to develop and maintain an adequate supply of skilled personnel in the industry.

"UNIVERSITIES, PRIVATE SCHOOLS, CORRESPONDENCE PROGRAMS"

Digest of Presentation by: H. B. Meek
Executive Director, Council on Hotel,
Restaurant, and Institutional Education

The Council on Hotel, Restaurant, and Institutional Education is a non-profit organization composed of schools and colleges that give instruction in hotel, restaurant, and institutional work. Its objectives are to help improve the member insititutions, their facilities, their faculties, and their students. With the assistance of the Statler Foundation it publishes and distributes studies and reports on important aspects of education for the food service field. It publishes bibliographies and lists of visual aids. It publishes a directory of all schools and institutions, whether members or not, that give instruction in this field. It maintains for loan without charge packets on training the executive housekeeper, on high school and vocational school commercial food programs, and on junior college curriculums. Its most recent publication is a list of the scholarships available to students preparing for work in the field.

Colleges and universities have trained home economics students for institutional and commercial food work for many years, The first university-

level program designed to train men for management responsibility was established at Cornell in 1922. Michigan State followed shortly after in 1928. Now there are numerous college programs.

Among the junior colleges, San Francisco City College has won excellent support from West Coast hotel and restaurant men, and New York City Community College has achieved similar success in the East. The American Culinary Institute, established at the close of the war to give culinary training to returning veterans, has become a principal source of well-trained prospective chefs. Excellent instruction in commercial foods has been given for 20 years or more at the high school level by the Chadsey High School in Detroit; the Edison Technical High School in Seattle; and the Washburne Trade School in Chicago.

College programs are each probably turning out from 15 to 125 graduates each year. Graduations from other post-high school institutions are generally smaller. The average high school graduates from 20 to 40 each year. The total product of all schools annually is estimated to be from 3,000 to 7,000 graduates.

Because training in skills bulks so large in any program of commercial food education, correspondence instruction has thus far had only a limited development. The Educational Institute of the American Hotel and Motel Association gives two correspondence courses of interest to restaurant workers: "Food and Beverage Controls" and "Food and Beverage Purchasing." Pennsylvania State University offers a correspondence course in "Commercial Food Service Management."

Cornell and Michigan State have resident courses designed to upgrade employees in the field. A number of junior colleges and local high schools offer extensive "after work" training courses.

In a study of education for the restaurant industry which I have been making for the National Restaurant Association, 98 percent of the nearly 800 graduates of resident institutions who were surveyed, reported that they are happy in their work; 88 percent feel they are doing very well compared with their former grade school friends. Salaries for graduates of strong university programs are reported to average well above $15,000 after 10 years' experience. Other salary reports are also excellent. The survey shows that commercial food service offers an interesting, attractive, and economically rewarding career.

x x x x x x x x x x x x

"PROVISIONS, RESPONSIBILITIES, ACHIEVEMENTS, AND CHALLENGES OF MDTA"

Digest of Presentation by: John P. Walsh
Deputy Director, Office of Manpower, Automation and Training, U.S. Department of Labor

Provisions of MDTA

The MDTA of 1962 provides for the training and retraining of the unemployed and underemployed in order that they may move back into the mainstream of employment in jobs that are available.

Federal funds are provided to make determinations of manpower requirements and resources as well as to make determinations of job availability through skill surveys.

Funds are made available to recruit, counsel, test, and refer eligible individuals for training, to provide such individuals with training and with allowances, and to place them in jobs on completion of training. Eligibility for training allowances, which equal the average unemployment compensation payments for the State in which the individual resides, is limited to those who are unemployed heads of households with at least two years work force experience. Out-of-school unemployed youth between the ages of 17 and 21 may receive special youth allowances while in training.

Funds are made available to cover the costs of institutional or on-the-job training including instructional salaries, equipment, supplies, and the like, for programs up to 52 weeks in length, or even to 72 weeks if special basic educational development is involved.

A program of research in the automation and manpower arenas can be conducted through the Federal establishment as well as through contracts with public and private institutions and individuals.

Responsibilities

The Manpower Administration of the U.S. Department of Labor, representing the Secretary of Labor, is charged with the responsibility of carrying out the act. However, two great Departments of Government, the U.S. Department of Health, Education, and Welfare and the U.S. Department of Labor, coordinate their efforts in the conduct of the several programs under the act. Responsibility of the several Bureaus of the Manpower Administration is as follows:

The Office of Manpower, Automation and Training (OMAT) is charged with responsibilities for planning, research, and evaluation, and for the conduct of experimental and demonstration programs.

The Bureau of Employment Security (BES) is charged with operating responsibilities that deal with skill surveys and job determinations; counseling, testing, and referral of trainees; payment of training and subsistence allowances; and placement of trainees.

The Bureau of Apprenticeship and Training (BAT) has the responsibility for the promotion and development of on-the-job training under the act. Activities involving the operation of institutional training programs, including the development of course content, training equipment and materials, instructional staffing, and the like, are the responsibility of the U.S. Department of Health, Education, and Welfare and fall under the purview of the Division of Vocational and Technical Education of the Office of Education.

Both Departments receive the counsel and advice of the National Manpower Advisory Committee, representing labor, management, education, training, agriculture, and the public. Similar committees constituted at State, regional, and local levels provide guidance to program operators throughout the Nation.

Achievements

Programs under the MDTA have helped to underscore the fact that when people have the right training at the right place at the right time, they can get jobs. Of the thousands of unemployed individuals who have completed training programs, 70 percent have found immediate employment in the occupational area for which they were trained. While most of the training to date has been carried on as institutional training, we are now seeing the emergence of on-the-job training to a greater extent. Both institutional and OJT programs have been utilized in the preparation of workers for the food service industry.

One of the gratifying achievements under the MDTA has been the outcome of experimental and demonstration projects that have been established to try out innovating, threshold-crossing ideas both in terms of the counseling of disadvantaged, unemployed individuals, as well as in the training activity itself. The real success of the program is going to be made in dealing with the hard-core unemployed--in stimulating, motivating, and training the disadvantaged, the older worker, the migrant worker, and the like. This calls for a massive thrust in revising some of our practices, not only in the selection and referral process but in the training process. It means that we must take a comprehensive look at the training needs within industry groups--the specific purpose for which this meeting was called--in order to determine how we can best utilize the manpower resources we have at hand. It means that we must make a careful scrutiny of job requirements on a realistic basis so that we can match available people with available jobs.

x x x x x x x x x x x x

"COUNSELING, TESTING, ALLOWANCES, PLACEMENT"

Digest of Presentation by: Louis Levine
Director, Bureau of Employment Security
U.S. Department of Labor

Training is undertaken not as an end in itself but is concerned with the eventual matching of people with job opportunities. Most important of all is the utilization of qualified people. There is no justification for undertaking training where racial discrimination, substandard working conditions, and substandard wages are involved. When we undertake training, we have to do it within the realities of labor market conditions and they vary widely as to type of industry, occupational structure, and volume of unemployment.

Amendments to the Manpower Development and Training Act emphasize "employability" rather than reasonable expectation of employment. Therefore, many people may now be trained who formerly could not qualify for training. We may be training in occupations or fields in which the employment opportunities are not immediately available. Under the amended act, training will be more geared to disadvantaged youth, to the culturally deprived, to the educationally deficient. We can add basic literacy training to the training time and pay training allowances for such training.

Training does not take place in a vacuum but in a real situation, where people are living, where families live, where job opportunities may develop. In actuality, the local employment office, serving as a focal point of the job market concerned with supply, capabilities, or shortages of labor, can determine need for training and the potential of the area in terms of job opportunity.

Under the new amendments, the selection of trainees will become more difficult because not only will they be unemployed but they will require more counseling and more services. Tools and techniques not used in the past will be necessary. The Employment Service is planning to reach out to areas normally not touched. Youth guidance centers are being organized in major areas to reach disadvantaged, culturally deprived youth and to provide training for these individuals.

There is a wide variety of occupations and skill levels in the food service industry. Employers must be realistic in their hiring specifications and must think in terms of performance requirements. Some jobs require little skill, and training is therefore not a prerequisite, but perhaps literacy skills and basic education are needed. Unions, too, must be objective in working with employers because local employment offices will have to look to labor and management to determine the nature of requirements that will have to be met.

You have been discussing wage levels, turnover, and growth prospects. The answers to these questions do not lie with the Government, but are yours to find. We share your concern about these problems and Government is ready to cooperate in every way possible to find solutions to them.

x x x x x x x x x x x x x

"INSTITUTIONAL TRAINING PROGRAMS"

Digest of Presentation by: Roy Dugger
Director, Manpower Development and Training
Program, U.S. Office of Education

During 1963, vocational educators taught more than 14,250 food trades workers in long term pre-employment courses. More than 1,200 persons were enrolled in hotel and restaurant management courses during this same period. Manpower Development and Training Act programs enrolled an additional 1,375 persons in training that ranged from 4 weeks for short order cooks to 50 weeks for cooks in the hotel and restaurant trades.

While there is a willingness on the part of the schools to fill the need for skilled cooks and bakers, there have been relatively few Manpower Development and Training Act programs organized to date. Of 50 programs that have operated from Los Angeles, California, to Swiftwater, Pennsylvania, 32 had but one section operating at any one time. An additional 15 programs scheduled two sections. In all programs there were fewer than 1,400 cook and baker enrollees.

Quality of the food service programs seems insured by the quality of institutions doing the training, such as: Los Angeles Trade-Technical College; Lindsey-Hopkins Education Center in Miami; Mergenthaler Vocational-Technical High School in Baltimore; Hadley Technical High School in St. Louis; Bok Technical High School in Philadelphia; and Miguel Such Metropolitan Vocational School in Puerto Rico.

These institutions have augmented their facilities with modern equipment to provide outstanding training programs. All of these schools have training staffs of unusual competence. Many of the programs feed school faculties and students, and in some instances the public, thus making the training situation comparable to conditions in the industry itself. The instructors in these schools have had teacher training, and course outlines and other suggested teaching materials and guides have been made available to them. Added effort along these lines will be forthcoming from our Professional Services Section in the immediate future. Trade associations, unions, and other groups have been most cooperative in working with us toward sound training programs to prepare workers for entry jobs in the food service industry.

x x x x x x x x x x x

"ON-THE-JOB TRAINING PROGRAMS"

Digest of Presentation by: Ansel Cleary
Deputy Administrator, Bureau of Apprenticeship
and Training, U.S. Department of Labor

The Bureau of Apprenticeship and Training has been delegated responsibility for implementing the on-the-job phase of the Manpower Development and Training Act. On-the-job training is defined as training which uses instruction combined with work to qualify a trainee for a particular occupation. A prime feature of such training is its realism--its direct connection with the actual work situation. Training may be provided to develop new skills, to upgrade present skills, and to meet the needs of those displaced by automation, technological change, the geographical relocation of industry under certain conditions, or by changes in the labor market.

In your industry the occupations for which training can be given range from kitchen workers to waiters and waitresses and to the apprenticeable occupations of cook and baker. For the latter, MDTA resources can be used to stimulate apprenticeship programs where they do not exist or to assist an employer who wants to enlarge an existing program. Another possibility under MDTA is offered through pre-apprenticeship training--a brief course of instruction in a vocational school setting which precedes a regular apprenticeship program and provides basic knowledge of the trade. This technique helps meet industry's objections to hiring completely inexperienced employees.

The sponsor of an MDTA on-the-job training program may receive Federal funds to defray the cost of consumable materials, instructional supplies, clerical expenses, instructors' salaries, and other approvable expenses. The individual trainee may be eligible for training allowances, subsistence allowances, and transportation allowances. Allowable costs vary, depending on whether the training facility trains solely for its own needs or for its own and also the needs of the labor market.

Trainees in on-the-job training programs must be paid by the employer for all hours of training spent in the production of goods and services entering commerce. Remuneration is at the entry rate prevailing in the area for the occupation. Trainees may receive allowances from MDTA funds but wages, if called for in the program or if required according to law, are paid by the sponsor.

Training programs are not to conflict with or substitute for any on-going or customary training programs. Only in exceptional cases will a project be approved for less than 160 hours of training. Any unemployed or underemployed person who needs new or improved skills in order to obtain or to continue in suitable full-time employment is eligible for selection as a trainee.

To help meet the need for skilled chefs and cooks, a joint labor-management committee in a large city is sponsoring a culinary arts upgrading training project involving 90 employees and some 70 restaurants. MDTA funds are used to reimburse the sponsor for the salary and expenses of a full-time coordinator, for stenographic help, training materials and supplies. Under an MDTA cook apprenticeship program sponsored by an association of restaurants, 19 unemployed youth are receiving job entry training for 52 weeks. After 4 weeks in a vocational-technical school taking pre-job related instruction, they will be employed and trained in the kitchens of the various cooperating restaurants and will then continue in an apprenticeship program. Other food service industry on-the-job training programs under MDTA have been developed for such occupations as butcher, meat cutter, assistant cook, roundsman, short order cook, fish filleter, baker apprentice, and waitress. In the majority of programs, the trainees are paid wages by the employer.

Many employers have ready-made training sites that can be effectively used to meet their skilled labor needs. Employees who have the potential for more skilled work can be given tailored training that will upgrade them to higher level positions. This training creates, in many instances, job openings at the bottom of the job ladder for new hires.

Since the food service industry consists mainly of small establishments, several employers can band together, pool their facilities, and inaugurate needed training programs, or an employer and a labor union may jointly sponsor a program. Labor organizations, trade associations, industrial and community groups, public and private agencies, and State and local governments are also eligible as training program sponsors. To meet skilled manpower needs, to help workers realize their full potential, and to assist in relieving unemployment, employers and others are encouraged to take stock of their respective situations and consider the help available under MDTA.

x x x x x x x x x x x x x

SESSION III

REPORTS

OF

WORK GROUP DISCUSSIONS

SESSION III

WORK GROUP SESSIONS

Conferees were divided into four work groups on the second day of the conference to explore some possible solutions to the various manpower and training needs of the food service industry and to develop recommendations for meeting these needs. In each work group were representatives of labor, management, education, trade associations, and Government, as well as selected resource persons.

REPORT OF WORK GROUP NO. 1

Discussion Leader: Merle Strong
Acting Director, Trade and Industrial
Education Branch, U. S. Office of Education

1. What research does the food service industry need?
   a. Job identification; what, where, and how many jobs are available; what are the job descriptions for these jobs.
   b. Recruitment; methods of attracting youth into the industry; how can the image of the industry be changed.
   c. Selection of workers; methods of testing.
   d. Instruction; methods of instruction; qualifications for instructors.
   e. How to motivate employees to greater productivity.
   f. Availability of training.
   g. Follow-up study of employees; job progression, tenure, mobility, etc.

2. For what jobs should pre-employment training be provided?
   a. The problems of different entry levels, different kinds of establishments, and different entry requirements must be considered in determining length of training.

Occupation	Suggested Length of Training
Chef	Not an entry job
Cook Baker Butcher	50 weeks plus
Salad and Sandwich Specialist Short Order Cook Stores Clerk	6-13 weeks
Blue Jackets	2 weeks

b. Pre-employment training is desirable for each job except that of chef which is not an entry occupation and which requires progressive experience in various job levels.

3. What kinds of upgrading programs are needed?
   a. Programs for all levels of employed persons are needed to move them up the ladder.
   b. Because of technological change in the industry, training is needed to keep persons up to date for their present jobs.
   c. Both institutional and on-the-job training have a place.
   d. Basic education should be provided in some cases as well as skill and technical training.
   e. Training in supervision is desirable; good supervision will facilitate growth in other employees.

4. How are Federal funds obtained for training?
   a. Vocational education funds are made available to State Boards of Education on a matching basis.
   b. Expanded funds under the Vocational Act of 1963 will be made available on a similar State allotment basis with the exception that 10 percent of the funds for each fiscal year which will be used for research, leadership training, and experimental, developmental, and pilot programs especially for disadvantaged youth.
   c. Under the Manpower Development and Training Act, funds are allocated to the appropriate State agencies, and the determination of training needs and the establishment of programs are functions carried out at the State and local levels with approval, only, being vested in Federal representatives.
   d. To establish an MDTA training program, contact the local employment service office or local vocational education agency.

5. How can employees be motivated to upgrade themselves?
   a. Provide promotional information.
   b. Give recognition to the individual.
   c. Make upgrading glamorous.
   d. Stimulate management to upgrade employees.
   e. Improve working conditions.
   f. Encourage membership in trade and professional organizations.
   g. Offer adequate income.
   h. Stimulate reading of professional and trade publications.
   i. Establish recognized standards for each job classification.

RECOMMENDATIONS

1. That a national advisory committee of representatives from the food service industry be established to advise on the training of personnel for the industry.

2. That an existing Federal agency be designated to assemble and disseminate information on all training programs for the food service industry and resources for such training.
3. That the Dictionary of Occupational Titles be published at the earliest possible date.

x x x x x x x x x x x

REPORT OF WORK GROUP NO. 2

Discussion Leader: Earl Klein
Deputy Assistant Director for Manpower Development, Office of Manpower, Automation and Training, U. S. Department of Labor

1. What are the industry's pre-employment training needs?
   a. Cooks, waiters and waitresses, and counter employees are most in need of pre-employment training. The group lacked common agreement as to length of training for each occupational area and as to qualifications for various kinds of cooks. The need for generally accepted and applied definitions was emphasized.
   b. Conferees felt that vocational counselors do not understand the industry and job requirements; as a result they refer for training or employment only those who have difficulty with academic work. Parents do not have a favorable attitude toward the industry and do not encourage their children to prepare for it.
   c. Child labor laws and other restrictions serve as barriers to on-the-job training as well as employment for young people.
   d. Post-high school pre-employment programs are needed so that students can prepare for careers in food service fields.
   e. Training in ladder form would enable young people to enter the industry with pre-employment training and progress to skilled jobs or management jobs.
   f. Testing methods are not adequate for selection of students for pre-employment training.
   g. Participants deplored the lack of training guides and materials for pre-employment training and the difficulty in obtaining materials from institutions which are providing training.
   h. Licensing was suggested as a way to increase respect for employment in the food service industry.

2. What upgrading programs are needed?
   a. Adult evening school upgrading programs for cooks, other food service personnel, and restaurant managers should be inaugurated.

b. The American Dietetic Association's courses for food service supervisors which are conducted in junior colleges for employed persons recommended for upgrading training by their employers are good examples of upgrading training.
c. More mid-management programs, such as those conducted in Washington State in vocational and technical schools and junior colleges, are needed.
d. More college courses are needed like the Cornell courses for experienced chefs who wish to improve and upgrade their skills or to prepare for teaching and supervising.
e. Harvey Restaurants have adapted JIT training to train supervisors within the industry.
f. More local teacher training programs and more help in getting such personnel accredited for teaching for the industry are needed.
g. Upgrading programs are of special importance to restaurant managers, middle management personnel, trainers or supervisors, and cooks (for upgrading or improvement of skills for same job level).

3. <u>What are areas of needed research?</u>
a. Occupational mobility within the industry.
b. Labor market practices; recruitment methods; sources of workers; ways in which workers locate employment in the industry.
c. Skills, abilities, and knowledges required for key or selected jobs in the industry.
d. Nature and extent of technological change in the industry.
e. Methods and techniques in selecting new entrants to the industry and in identifying persons for upgrading.
f. Job descriptions and staffing patterns for the industry.
g. Attitudes toward employment in the industry and means of improving image.
h. MDTA research that would have implications for the industry.
i. Kinds of training methods and materials needed, especially for adults.

4. <u>Need for trained teachers for the industry.</u>
a. Shortage of teachers is accentuated by replacement needs.
b. Trained teachers are needed who meet accreditation standards; some States require academic standards which are very high; most chefs are unwilling to spend required time in taking professional courses.
c. Michigan and Cornell are conducting some experimental programmed instruction courses to assist in training personnel within the industry.
d. The American Vocational Association is starting a recruitment system for occupational teachers.

RECOMMENDATIONS

1. That conferences of this kind be conducted at regional, State, and local levels.
2. That guidelines be established on the effective use of advisory committees in developing and conducting training programs. Feed-back information is needed so that advisory personnel can be informed of problems and progress of training courses. Guidelines should be developed for use of ad hoc committees of representatives from labor and industry.

x x x x x x x x x x x x

REPORT OF WORK GROUP NO. 3

Discussion Leader: Donovan Armstrong
Program Specialist, Distributive Education Branch, U.S. Office of Education

1. What are the major manpower needs of the food service industry?
   a. First, second, and short order cooks.
   b. Pastry cooks.
   c. Butchers.
   d. Waiters and Waitresses.
   e. Chefs.
   f. Stewards.
   g. Storeroom workers.
   h. Bus boys.
   i. Cook-Managers (especially for nursing homes).
   j. Mid-management personnel and supervisory personnel.

2. What priorities should be given to developing pre-employment programs?
   a. Chefs and union representatives recommended on-the-job training as the best means of training cooks. Some pre-employment or orientation training might be useful for low-level entry jobs.
   b. Aptitude test battery available through local employment offices is helpful in selecting persons for pre-employment training as cooks, bakers, waitresses and waiters, school lunch program personnel, and counter workers.
   c. Union representatives stated that pre-employment training for minimal jobs is a waste of Federal money since these jobs are being eliminated by automation.
   d. Approximate length of pre-employment training for cooks should be 18 to 24 months in school, plus some practical application on the job.

3. <u>What upgrading programs are needed?</u>
   a. Supervisory and mid-management personnel; cooks; front office people (cashiers, auditors, checkers); waiters and waitresses; and kitchen personnel need upgrading training.
   b. Food service workers who have had some experience but are unemployed because of inadequate skills should be given retraining or refresher training to get them back in employment.
   c. To do an effective job of upgrading we must identify the real training needs; set up adequate standards in training and jobs; select competent teachers for in-service training; encourage workers to want to improve; upgrade employees in terms of changing job requirements; identify the educables; and motivate people to want to work and stay in the industry.

4. <u>What are the research needs in the food service industry?</u>
   a. Recruiting techniques.
   b. What happens to graduates of food service programs.
   c. The background of disadvantaged youth in different locales and their vocational potential.
   d. How can methods of teaching be improved.
   e. Why are experienced cooks unemployed.
   f. What are the factors of mobility among the unemployed.
   g. How can people and jobs be matched effectively.
   h. New trends in the food service industry; how will automation affect various job needs in this industry.
   i. Pilot or experimental programs to test our training for clusters of occupations. What commonalities are needed and can be given in a general program before specific skills are taught.
   j. What competencies should teachers have.
   k. How can good job and work attitudes be developed, especially for those with socio-economic handicaps.

5. <u>What can Federal agencies do in regard to curriculum materials?</u>
   a. The Office of Education can collect, collate, coordinate, and disseminate information on instructional materials and courses of study; use industry committees to validate materials; prepare curriculum guides.
   b. All Federal agencies can facilitate regional conferences to implement proposals of this conference.

6. <u>What are the available sources of curriculum and instructional materials?</u>
   a. Vocational and trade schools .
   b. Universities.
   c. Commercial publishers.
   d. Department of Agriculture, Small Business Administration, etc.
   e. Trade associations.
   f. Food producers associations.
   g. Armed Forces.

7. What use should be made of advisory committees?
   a. Local advisory committees should be used to advise on training programs, criteria for selection of students, placement, training stations, instructors, and the like.
   b. A National Advisory Committee could provide management, labor, and Government with valuable counsel and direction in meeting the manpower needs of the industry.

8. What teacher training resources are available?
   a. Teacher training should be set up immediately for instructors of MDTA and ARA programs. Four or five seminars of 4 to 8 weeks in various parts of the country would be helpful.
   b. Facilities of State Boards for Vocational Education should be tapped for pre-service and in-service teacher training.
   c. On-the-job instructors should be trained in methods of teaching. Only skilled craftsmen or chefs should be used as trainers.
   d. Management and supervisory personnel need training on how to supervise, how to train, human relations, how to conduct meetings, and other supervisory development courses.

RECOMMENDATIONS

1. That a National Advisory Committee of top leaders in labor, management, and Government be established, as well as sub-committees for special purposes or for regions.
2. That a central agency, such as the U.S. Office of Education, be designated to collect, collate, and disseminate information about courses and curriculums.
3. That teacher training institutes be organized to help meet the crucial need for qualified instructors in MDTA and ARA programs.

x x x x x x x x x x x

REPORT OF WORK GROUP NO. 4

Discussion Leader: Henry Przelomski
Assistant Chief, Division of Program Development
Bureau of Apprenticeship and Training,
U.S. Department of Labor

1. What priorities should be given to developing pre-employment training?
   a. The need in each local area should determine if pre-employment training programs should be organized.
   b. Pre-employment training for cooks is desirable and should be organized as pre-apprentice training.

c. More pre-employment training for the industry should be offered on high school and post-high school technical levels.
d. Suitability of institutional or OJT programs for cooks should be determined on the local level.
e. Because of the great variance in institutional and OJT training programs, the industry, assisted by the Governmental agencies concerned, should develop guidelines and suggested training patterns for use of local groups.
f. Some conferees felt that priority should be given to upgrading those already in the industry; others felt that the overall needs of the area should determine priorities. Both groups agreed that upgrading training is needed.

2. How can curriculum guides and instructional materials be developed?
   a. A State or National Committee should be appointed to work in the area of curriculum for this industry.
   b. The U. S. Office of Education's curriculum guide, now out of print, should be reprinted.
   c. Some State and local agencies have been successful in recruiting retirees to work on curriculum.

3. In what areas should research be conducted?
   a. What the food service industry really wants and needs in the way of manpower development.
   b. Reasons why the food service industry is not attracting more desirable applicants, and methods by which the industry can.
   c. Worker traits conducive to success in food service occupations.
   d. Effect of racial discrimination on recruitment, and if this is local, regional, or national in scope.
   e. Validity of test procedures in predicting and detecting worker qualities desirable in the food service occupations.
   f. Possible effect of licensure on selection and recruitment.

RECOMMENDATIONS

1. That the Federal Government initiate, develop, and disseminate "Standard Procedure Sheets" for various operations in food preparation.
2. That the Federal Government continue to provide funds for food service training programs initiated and desired on local levels.
3. That the Federal Government prepare and make available several standard "skeleton" training program structures modeled on the "J" programs of World War II, with flexibility for adaptation to local conditions and techniques.
4. That a national steering committee, composed of representatives of labor, management, and Government, be organized for food service industry manpower matters, and if possible, a secretariat be established for the committee by the Manpower Administration.

SESSION IV

COMMENTS

ON

NEXT STEPS TO COOPERATIVE ACTION

SESSION IV

Chairman: John C. Donovan
Manpower Administrator
U. S. Department of Labor

"NEXT STEPS TO COOPERATIVE ACTION"

Comments by: Frederick B. Sweet
Managing Editor, "Catering Industry Employee",
Hotel & Restaurant Employees and Bartenders
International Union

Despite a popular image to the contrary, the labor movement shares a characteristic once ascribed to America by Walt Whitman when he said, "America is a multitude of individuals." This is also true of the labor movement. There is often a degree of unanimity in the trade union movement, but it is by no means a monolithic institution. It is an institution in which there is room for considerable variety of outlook, and this same quality is to be found in the public feeding and lodging industry in the United States. We have autonomy in our unions, which means there is a certain amount of freedom at the community level. In your industry, because of a great disparity in size of establishment and the nature of American enterprise, there is also a high degree of autonomy.

Our International Union is heavily committed to the primacy of upgrading, of skill improvement, and of on-the-job training of those already employed. While we do not rule out those cases in which classrooms, as well as kitchens and dining rooms, may be the scene of the training, we have a primary obligation to those in the shop now. In trying to solve the problems of manpower development and utilization, there are bound to be certain kinds of organizational rivalries. There are rivalries between those who favor on-the-job training and those who favor institutional training. There are rivalries between management and labor. There are rivalries in the Government between agencies competing for access to a given appropriation. There are rivalries between professional and trade associations. All of us must do our best to minimize the frictional consequences of these rivalries and bear in mind that we are earnestly engaged upon a most difficult, serious, and worthwhile task together. Labor accepts a joint responsibility with management, education, and Government in seeking viable and useful answers to our problems.

First, we have an obligation to identify the real training needs. Training programs should be organized only if there are jobs to be filled. In spite of the commonly held but erroneous view that unions are primarily interested in collecting dues, we feel our people deserve better treatment at the hand of planners than to be prepared for jobs that simply are not there.

There must be established, through appropriate machinery, adequate standards of training, as well as standards in new jobs. This is of utmost importance to the future of the industry. Every effort must be made toward standardization of job titles, job descriptions, etc., and adequate standards should be readily available, disseminated, and accepted as valid by knowledgeable people in the industry.

We must do everything we can to provide competent teaching. It is far better to find a good craftsman who is blessed with the potentialities of becoming a good teacher than it is to find a teacher and try to convert him into a craftsman. We must also work together on curriculums and teaching tools.

Management and labor share a heavy responsibility to those already employed in this industry to encourage them to seek improvement and advancement. Upgrading the worker will enrich the community, will be of material assistance to management, and will help us in our continuing efforts to raise the level of wages. Management and labor are often looked upon as implacable foes, and certainly we have our areas of disagreement. But the vitality of the industry, in which management has its investment and we have our jobs, is obviously one area where there can be common agreement.

The industry is going to see a considerable increase in the employment of Negroes, Puerto Ricans, and other minority groups. Fair employment practices under the Civil Rights Act place employers and unions alike under heavy legal injunction to see to it that the work place is as American as apple pie--a place in which each of us may stand on his own feet and be recognized as a human being, without concern for the color of his skin, the church his daddy went to, or the land he came from.

Management and labor should make music together on this business of job orientation and of motivation. We who represent the men and women in the kitchens and the dining rooms, and you who represent the management people, must work together to enchance the desirability of jobs in this industry. People must want to be cooks and waiters and waitresses. To get them to want these jobs requires a variety of techniques of motivation.

All of this reemphasizes the need for a tripartite body representing labor, management, and Government to provide leadership and guidance in meeting the manpower and training needs of the food service industry.

Comments by: Kathryn Bruce
Educational Director
National Restaurant Association

The professional staff members of trade associations function under governing bodies or boards of directors. Some of our suggestions are within our functional authority; others may be subject to approval of our respective boards of directors.

Perhaps our most significant suggestion is for greater cooperation and coordination among trade associations in support of educational activities. This would benefit the Government agencies through improved communications, application of collective knowledge, and greater resources. Steps will be taken to have a meeting of the association groups to formulate an inventory of our training resources, needs, and suggestions.

Additional steps to cooperation are:

1. Effectively communicating to our members, boards of directors, and State and local associations, the methods and importance of cooperating in the development of training programs conducted under the auspices of the Department of Labor and the Office of Education.
2. Encouraging association members to be responsive to and cooperative with research programs by supplying information when requested.
3. Providing the results or findings of any surveys or statistical research conducted by the associations or allied groups to the appropriate Government agency.
4. Participating in the establishment of a central source of information pertaining to all phases of training programs for the industry.
5. Attempting to establish standards of performance for job classifications in the industry as a guide to training and worker evaluation.
6. Cooperating in strengthening and expanding testing procedures for employee or trainee selection.
7. Assisting in developing curriculum guides and instructional materials.
8. Assisting in establishing qualifications standards for instructors and in recruiting and developing instructors.
9. Encouraging and assisting in the formation of local industry advisory committees for the food service industry.
10. Encouraging and assisting in the expansion of on-the-job training programs under MDTA.
11. Identifying and suggesting research and experimental or pilot programs for the food service industry.
12. Continuing and increasing efforts to strengthen the upgrading training of employees and improving working conditions within the industry.
13. Assisting in providing channels for placement of individuals successfully completing training programs.

Comments by: Richard S. Teranes
Personnel Relations Manager
The Prophet Company

The majority of management representatives in attendance at this conference are from national chain organizations--companies employing many thousands of persons. National chains have specialists in staff positions who continually attempt to keep current in this field of education.

I cannot presume to speak for all of management due to the nature of our many and varying types of restaurants. However, discussions with management representatives indicate a definite interest in the further development of the many programs discussed during the past few days. Serious consideration should be given to conducting surveys to determine what management's needs will be for the next 5 years. This is essential if future training is to keep pace with rapid advances taking place in the food packaging and processing industries. Some management representatives have expressed interest in continuing adult education programs for employees. The employee or new entry in the field should show a personal interest and display personal sacrifice in moving ahead as a worker and as a person.

The image of our industry can be furthered if we discontinue our "bickering" about low wages (a generally erroneous assumption) and poor working conditions (non-existent in the majority of cases).

The industry is investing $2500 for each new job and will continue to do so. This means that training will become more important and management will cooperate with all concerned, preferably at the local level, as this is where problems exist and differ by area. Local restaurant managers and owners should be informed about the various programs discussed at this conference, manpower requirements should be determined, and additional funds should be secured, if necessary, to conduct local programs.

Management is proud of its employees. Many come into the industry untrained, and after training by management have become important assets to our industry.

x x x x x x x x x x x

Comments by: Philip W. Seagren
Director of Adult Vocational Education
Lindsey Hopkins Educational Center

The manpower problems of the food service industry are of immediate concern of all of us; my comments will be based on local observations of the problems. It seems ironical in a metropolitan area such as greater Miami which is very dependent upon the tourist trade that we had to close our high school program for cooks in 1947 because of lack of students. We

have the knowhow in teaching and the training facilities in Miami, so there must be other reasons for the lack of students. We took on new hope with the passage of the Manpower Development and Training Act, but when the Employment Service recommended training in seven occupations, we were unable to open classes in two of them--cooking and waiter-waitress training--because unemployed persons were not interested in training for these occupations.

This may be due to various factors. The restaurant people in our metropolitan area are not working as a nnit in the local greater Miami Restaurant Association. Meetings are poorly attended; about 70-80 percent of those in attendance are purveyors and the same handful of owners and operators; and it is difficult to inspire this group to assist us in training. Vocational education cannot be of help to this industry until the owners and the operators begin to realize the importance of pre-employment training and to motivate their present employees to take extension classes for upgrading, which is a common practice in all other industries in our areas. We stand ready to at any time to offer preparatory, extension, and on-the-job training.

To make food service training and employment more attractive to more people, the following suggestions might be helpful:

1. Vocational education in the past had a poor image in the minds of the public but in recent years has improved its status by striving for quality education, proper selection of trainees, and better service to industry. Many fine articles have been published nationally about the importance of vocational education to the Nation's welfare. Similar efforts should be made by the food service industry.
2. Local restaurant associations should invite junior and senior high school counselors to a dinner meeting, should outline the employment and pro motional opportunities for well-trained food service workers, and should give them a behind-the-scenes picture of the food service industry in hotels as well as in restaurants. Few are aware of the good salaries that can be earned by chefs and executive chefs, as well as other skilled employees. There are also lower-level job opportunities that need to be brought to the attention of guidance people.
3. The food service industry should place special emphasis on its security and fringe benefits. It needs to clarify job classifications so that new employees can see the range of promotional opportunities and be motivated to upgrade themselves.
4. The industry should also participate in management training for supervisors and department heads in order to develop better communications on an inter-departmental basis, improve public relations, and strengthen relationships within the organization. This, in turn, will result in better orientation, supervision, and retention of employees.

x x x x x x x x x x x x

Comments by: Henry O. Barbour
Director, School of Hotel, Restaurant and
Institutional Management, Michigan State University

There are three traditional roles of the college or university: (1) Orderly assembly of present knowledge; (2) teaching of that knowledge; (3) research--actual discovery and development of new knowledge.

Universities could be more active in assembling and collating reports, curriculums, books, slides, films, video-tapes, and other materials relating to food service training. Universities could disseminate this knowledge in cooperation with various agencies, both public and private.

Hotel and restaurant schools in colleges and universities have a primary function of educating managers and mid-management supervisors. This function should be continued and expanded, offering the opportunity of either 2 or 4 years of college work to more citizens interested in the food service field. In addition, universities should be developing teachers from among young people who are working toward their baccalaureate degrees, from those who are working toward advanced degrees, and from promising workers who have had seven or more years of successful experience in the industry. Not only should these people be offered the opportunity for pre-service education, but the university should develop an academic professionalism among them through workshops, particularly in the summer; through the development of new teaching techniques; through the updating of knowledge in the field of education applied to food service training and in the field of food service operations.

In teaching the knowledge we now have, universities can best carry out their leadership role by means of demonstration programs, such as those presently conducted by Florida State University and Michigan State University. There are two ways of teaching--one, through the spoken word in the classroom; the other, through the written word pursued in some other locale than the university itself. The production of knowledge in written form is an important function of faculties of colleges and universities.

Universities have been the stronghold of research--research in basic and applied knowledge and research in teaching techniques. This has been done by most universities in a highly successful fashion for other industries; similar attention to research for the food service industry is long overdue. With the support of industry and Government, it would be possible to conduct research in such areas as teaching techniques and the learning process, particularly as related to on-the-job training; job knowledge via job analysis, job descriptions, studies of working conditions, etc. Research is needed to evaluate demonstration and experimental programs of teaching and training. Moreover, a great amount of research is needed in technology relating to the science of food production and its subsequent service.

Colleges and universities of the United States which are the creatures of the citizens of this great land, have certain capabilities, experience, and facilities which would be of value to the food service industry. Certainly every university and college represented here today is awaiting for whatever activity is deemed necessary in this area.

x x x x x x x x x x x

Comments by: Francis A. Gregory
Assistant Director, Office of Manpower, Automation and Training, U.S. Department of Labor

A keen interest has been expressed in establishing a central coordinating body responsible for the collection and dissemination of information vital to the training of qualified workers for this industry. While the development of training standards and curriculums is the responsibility of education, the Department of Labor can assist by providing a variety of services, such as determining employer needs and defining the occupational limits within which training may be provided.

We would like to see consideration given to conducting meetings, perhaps similar to this conference, on local, State, or regional levels. Out of these meetings would come specific programs to meet the needs of the particular area. The Office of Manpower, Automation and Training, through its network of regional offices, is in a position to help organize such meetings if the parties involved express the interest in and need for further investigation in their own areas. Our field directors can also help in setting up local or regional advisory committees for the purpose of assisting education, management, and labor in identifying the manpower problems of this industry and in instituting training projects to relieve such problems.

You have statistical information in your kit about the number and types of training programs already approved under MDTA and ARA. True, the number is minimal in terms of the total needs of the food service industry--funds appropriated under these acts can no more than perhaps indicate what can be accomplished through training, as well as what types of training content and methods will be most effective for various groups of occupations and workers.

In addition to basic research in various aspects of manpower development and utilization being conducted under title I of MDTA, a number of experimental and demonstration training projects and studies are being conducted under title II of the act to investigate problem areas relating to occupational training and employment. Funds have already been contracted by the Department of Labor to private and public groups and organizations, including

educational institutions, labor unions, and non-profit organizations, to carry out these special projects. Experimental and demonstration projects are designed primarily for hard-to-place persons who do not have a marketable skill and who need various supporting services in addition to job training. Programs frequently provide basic education, where needed, to complement the occupational training portion of the program. In other projects, training content and teaching techniques have been modified to meet the special needs of the group. Many of the experimental and demonstration projects have been supplemented with intensive counseling services to assist individuals in adjusting to the training program and later to the job situation. Lessons learned from the conduct of these projects will be interpreted, where appropriate, into policies and standards governing the conduct of training under MDTA.

Many problem areas in the training of qualified workers for the food service industry have been identified in your work group discussions. We invite interested persons and organizations knowledgeable in these problem areas to submit proposals for special projects to investigate these problems. The Office of Manpower, Automation and Training can provide technical assistance in the development and implementation of experimental and demonstration projects. Proposals may be sent to this Office, U.S. Department of Labor, Washington, D. C.

Because this is a growing as well as a changing industry, there is a continuing and increasingly urgent need to identify its problems in relation to manpower. During this conference you have isolated the problems and made specific recommendations. We need now to follow through on these recommendations. However, this can only be done with the fullest cooperation of all parties concerned--management, labor, education, and Government. We in OMAT will do all that we can to work with you in implementing the recommendations developed during the past few days.

x x x x x x x x x x x x

Comments by: Seymour Brandwein
Deputy Assistant Director of Research
Office of Manpower, Automation and Training
U.S. Department of Labor

A good deal of attention in your workshops has been focused on research, on the need for more information and understanding of some of the manpower needs of your industry. Many of your suggestions for research point up that MDTA training is itself a vital research tool. Although MDTA training programs are nowhere near sufficient in number to meet the training needs of this industry, they are a significant means of determining what can be accomplished through training and what training content and methods are most effective for different jobs and groups of workers.

But the Manpower Act goes beyond this type of research, this learning through doing. The act not only provides for training programs, but expressly provides for an expanded comprehensive research effort in the manpower field to develop the information and insight needed to meet our manpower requirements and put to full use our manpower resources. This is in addition to the existing research activities of the Department of Labor, such as the occupational outlook work done by the Bureau of Labor Statistics for guidance and counseling, and the area skill surveys of the Employment Service Offices of the Bureau of Employment Security.

Some of the funds provided under the Manpower Development and Training Act for broadened research activities are being used to contract with university experts and other qualified groups and individuals to conduct specific research in the manpower field. We would be glad to explore with responsible groups in your industry the possibility of jointly conducting some area of specific research in which you are interested. We would also like to learn more of what your industry has been doing in exploring your manpower needs, your changing structure, and your technological course. This conference has helped develop the acquaintanceships and groundwork for such follow-up.

The Secretary of Labor's recent report on Manpower Research and Training under MDTA describes the nature and range of the research being undertaken both under contract and by the Department's staff itself. Relatively little of our research is geared directly to the food service industry alone, nor could it be, for we are not established as the research arm for your industry. But the information developed on many subjects and in cross-industry research may offer rich returns for those who actively look beyond their own industry boundaries to determine how knowledge developed generally may have applicability in their own ranks. For example, information on worker attitudes toward training--what makes workers receptive or apathetic to training opportunities--is one area we are exploring in some of our research activity. Another significant area in which we are broadening our research efforts is on methods of developing more reliable projections of likely future need in various occupations, so as to encourage and enable more realistic planning ahead on manpower development. We are also stepping up our examination of technological developments in various industries and their implications for job content and manpower requirements.

You are urged to examine more closely what we have been doing in the research sphere and to give us your suggestions and assistance in developing additional research programs to help us all in resolving our manpower problems more knowledgeably and effectively.

Comments by: John McCauley
Director, Training Operations
Bureau of Employment Security
U. S. Department of Labor

The manpower problems facing the food service industry are numerous and complex. Many of them cannot be solved solely by the industry, by organized labor, or by Government. Solutions must be worked out cooperatively.

During this conference a suggestion was made that similar conferences be set up on a regional basis and eventually on a State basis. A more effective approach would be to initiate action at the local level. Manpower needs which can be met through training programs may vary widely among local communities and among employers in those communities.

Greater cooperation on the part of the United States Employment Service and its affiliated State agencies is a goal we can help achieve. Local employment service offices can serve as the focal point in determining labor supply and demand locally; in identifying or confirming shortages in your industry; and in planning training curriculums to assure development of well trained workers in the food service occupations.

We can put more emphasis on your personnel needs in developing information on manpower requirements. We can determine, through contacts by local office representatives, where large numbers of vacancies exist in your industry, what your employment specifications are, and suggestions about the kind of training and basic education needed.

With the cooperation of the vocational education authorities, who actually plan and conduct the training, and the local employment service offices responsible for selection of trainees and payment of training allowances, we believe the workers you need can be obtained. If management and labor are realistic in discussing manpower requirements with the local employment service and local education authorities, the facilities of those agencies can be utilized most effectively.

Comments by: Glenn Mitchell
Chief, Division of Construction and Manufacturing Industry, Bureau of Apprenticeship and Training
U. S. Department of Labor

The degree of skill possessed by the individual worker determines the quality of the job he is able to perform. When jobs require extensive trade knowledge and skill, training must be correspondingly complex.

Training for craftsmanship involves preparation, not for a simple skill, but for the many types of related practices that may be handled by a competent craftsman.

Apprenticeship and other on-the-job training programs have long been recognized as effective means of learning a skilled trade. Through its field staff, with offices in every State, the Bureau of Apprenticeship and Training works with local employers and employees in developing apprenticeship and industrial training programs to meet specific needs.

Since programs to retrain and upgrade present industry personnel is of utmost importance, employers interested in such programs should contact either the local BAT office of our national office here in Washington. Bureau representatives can assist in the development and operation of pre-apprenticeship or job entry, apprenticeship, and journeyman training programs.

We are very much interested in the formation of a National Advisory Committee for the Food Service Industry as an approach to meeting your manpower needs. I would also suggest that food service industry committees be established in local communities to investigate the type or types of training needed in the various areas of the country.

The Bureau of Apprenticeship and Training offers its cooperation and assistance in promoting sound training programs at all levels.

Comments by: Earl M. Bowler
Chief, Professional Services Section
Manpower Development and Training Program
U. S. Office of Education

The next steps to cooperative action to be taken by the Division of Vocational and Technical Education will be the development of several curriculum guides in the food trades area.

Manpower Development and Training programs will be conducted in areas where job opportunities exist. The Professional Services Section plans to provide assistance in teacher training to further the effectiveness of all programs. In addition, research and leadership activity is expected to improve the quality of foods training as knowledge gained at this and similar conferences is applied to specific situations.

There have been some excellent comments and ideas brought out during the past few days which pinpoint vital challenges for vocational educators. We need to do a better job of communicating. It appears that our "sending"

equipment is pretty good. We publish news stories, issue bulletins, and, from time to time, we get on the radio and tell our story. Our weakness seems to be in the "receiving" apparatus. Seldom do we assemble groups such as are present here to discuss in depth their problems and their plans for future action. The kind of communications we have had at this conference is many times more effective than that of the "single shot" approach used too long in our field.

A second need that must be met if vocational educators are to reap the full benefit of this conference for the food service industry is to make sure the proceedings and findings of the conference are fed back to those who do the training in institutions across the land. The Division of Vocational and Technical Education welcomes the opportunity to make available to vocational educators in the 50 States a report of this conference. In turn, I would hope that other clinics, conferences, and institutes might be held to implement the findings brought to light through our conference discussions.

Vocational educators are strong believers in and supporters of apprenticeship. These educators are charged by the Congress with the responsibility of providing related instruction for apprentices. Each year thousands of apprentices receive their science, mathematics, drafting, and related instruction in vocational evening classes. Any apprenticeship program worth its salt has built into it a program of related instruction. Many vocational schools also provide apprentices with the opportunity to acquire skills and academic knowledge not likely to be available through on-the-job experience.

Encouragement has a place in our discussion because those who work with us need to be encouraged to help improve the quality of vocational education. We need to do a better job of public relations, but more importantly, we need "feed-back" such as we have heard in this conference. We need to know the real needs of the food service industry. We need to know who in the industry does or does not understand what is being done by the vocational schools throughout the country. We want to encourage honest appraisal.

There is a need to sell training and the developing of people. The most effective selling is that which leads to the involvement of key people. All of us are interested in quality programs, and the best way to insure quality is to actively involve management and labor in these programs. Representatives from both groups should be urged to serve on advisory committees, as school board members, as instructors

(day or evening), as student counselors, as members of lay citizens groups, and on city councils.

Finally, evaluation is an important need. Programs must be evaluated periodically, and adjustment and redirection must follow. Groups such as those represented here should be involved in program evaluation if vocational education is to be kept attuned to the requirements of the food service industry.

*PROJECT FEAST; SAN FRANCISCO; CALIFORNIA

Project FEAST appeals to and offers opportunity for all high school youth regardless of color, ability, or economic status, to explore or prepare for a career in the foods industry. A high percentage of FEAST students complete high school, and those with motivations and abilities for further schooling can proceed through the articulated continuum of California Community College and the 4-year college. Team teaching interrelates laboratory experiences and basic education, so that general education requirements become meaningful. Material covered is oriented so that motivation, skills, understanding, and attitudes can be tested in actual job situations. Ten schools participated in project FEAST. Teachers spent 4 weeks in general orientation and in actual experience in industrial quantity food preparation, and had conferences and visits with industrial representatives. They developed curriculum outlines for Grade 11. During the second summer teachers revised outlines and developed the 12th grade curriculum. Teams from all schools met during the semester to air problems, brainstorm and report on developments, and introduce new materials and ideas. The project director and advisors are continuously available to individual teams for consultation. (FP)

PROJECT FEAST

(FOODS EDUCATION AND SERVICES TRAINING)

Project FEAST is a high school program developed in the San Francisco Bay Area for training students in foods preparation and service. It was originally sponsored by the Hotel and Restaurant Foundation of the City College of San Francisco under a grant from The Ford Foundation. Initiative for the development of each individual program was taken by the staffs of the local high schools and their district offices. The support and encouragement received from the California State Department of Education, Bureau of Homemaking, Vocational Education Section, has contributed extensively to the spread of the idea and was invaluable in obtaining additional federal government funding under provision of the Vocational Education Act of 1963.

Founded in 1964 by:
Ford Foundation grant, administered by
Hotel and Restaurant Foundation of the
City College of San Francisco

Funded by:
Vocational Education Act of 1963 through
California State Department of Education
Vocational Education Section
Bureau of Homemaking
Local school districts
Ford Foundation

Sponsored since 1966 by:
San Francisco State College's
Center for Technological Education

PROGRAM OBJECTIVE

The purpose of the program is to afford interested and qualified students an opportunity first to explore and then to prepare for a career in the commercial foods industries.

The high school curriculums are so designed that occupational training is conducted on a continuing basis and students leaving school at any juncture after the first semester will have employable skills. Experience to date has demonstrated that a high percentage of the FEAST students complete high school.

Project FEAST was planned so that instruction in areas other than food service and preparation reinforces the occupational training. The FEAST faculty functions as an inter-disciplinary team, planning their instruction together. Materials in English and business at the eleventh grade are closely related to the content covered in the foods laboratory. As the student recognizes the application of these subjects to success in his chosen career, he applies himself to learning the basic skills of the regular curriculum. The cafeteria manager and a counselor are also members of the team to assure meaningful on-campus laboratory and work experience and to provide informed occupational guidance.

It is expected that teachers and employers will encourage the student who goes immediately from high school to work to further develop his potentials by taking advantage of on-the-job training and apprentice programs, local adult education programs, the American Hotel and Motel Association Educational Institute

Courses, National Restaurant Association short courses and/or other available opportunities, depending on his field of interest and abilities.

The student who demonstrates the abilities and motivation necessary for further schooling is advised to continue his education in one of the California Community Colleges' specialized programs for the foods service industries. Close cooperation is maintained with institutions offering such training and the City College of San Francisco, Laney College in Oakland and John O'Connell Technical Institute in San Francisco. A student with exceptional academic ability and interest will be encouraged to aim for a four-year college program in Hotel and Restaurant Administration.

It is expected that as experience with Project FEAST graduates increases, all related post high school programs will be altered to effect such articulation. These institutions should then be able to enrich their offerings and expand their programs to better prepare these young people for their chosen career. There then will be in fact a continuum from grade eleven through an apprentice or training program, or through grade fourteen in a junior college and, in the case of certain qualified students, through the baccalaureate. The actual school experience, whatever it may be, will produce a qualified employee working at a job commensurate with his academic abilities, occupational aptitudes, and personal characteristics.

The goal of Project FEAST is to provide a program that will make school more meaningful--challenging the student's interest and developing his full potential. The graduate will have basic knowledges and skills necessary for the beginning level of employment. He should have the added incentive to continue his educational and intellectual growth after employment. He becomes an asset to his community, a strong person within himself.

HISTORY OF THE PROGRAM

The first program that was developed to satisfy the basic objectives described in the preceding was the Pre-Engineering Technology Program (Richmond Plan) sponsored by a Ford Foundation grant. The success of this program caused administrators, teachers and industry to wonder about its adaptability to other occupational fields.

Among these were the members of the City College of San Francisco staff who were convinced that it would give new meaning and incentive to the high school education of many students; it would provide effective articulation with many semi-professional programs; and it would provide sorely needed trained personnel for many industries.

After conferring with Marvin J. Feldman, Program Associate of the Ford Foundation, the architect of the Richmond Plan and Dr. Louis F. Batmale of the City College of San Francisco, it was agreed that the next logical step was to test these principles by experimenting in one additional field.

The field selected was that of foods preparation and service. The reasons for this choice were:

1. The excellent reputation and wide acceptance of the City College of San Francisco Hotel and Restaurant Program;

2. The genuine interest of the local hospitality industry in education;

3. The availability of a highly qualified Project Director, Mrs. Hilda Watson Gifford;

4. The ability of the program to serve a broad range of student abilities; and

5. The great and growing variety of employment opportunities available in this field.

Jobs may be found in the hospitality industry for the entire range of abilities, from the lower level high school trained person to top management opportunities for the college trained graduate in Hotel Administration. Many years ago, Ernie Byfield wrote, "The hotel industry uses ten professions and forty trades." These numbers may well have increased with the recent great growth of industry and demands of the government and the public.

A proposal for a grant was submitted and approved. The contracting agency on behalf of the City College of San Francisco was the Hotel and Restaurant Foundation. This non-profit organization had been founded by members of the alumni, supporters from industry, and representatives of the staff for purposes of managing gifts and grants to this department of the College.

The grant was made for a two-year experiment in three schools: Pacific High School, San Leandro; Oakland Technical High School, Oakland; and Balboa High School, San Francisco. The program was implemented in the first two schools in 1964, and in the latter in 1965. These three schools covered San Francisco and the East Bay. Interest was such that it was deemed advisable to encourage and include schools in the second year from the third Bay Area community, the Peninsula. Capuchino from the San Mateo High School District and Ravenswood from the Sequoia High School District applied and joined in during the second year of the program.

The concept had taken such hold that the Ford Foundation established at San Francisco State College the Center for Technological Education. The Center has for its purpose a broad program of developmental studies to expand and strengthen the Pre-Technological programs. It was planned that this Center would provide a resource center for schools already committed to this approach to education, helping them with their problems and in the improvement of their respective programs. The Center now provides consultancy services, a counselor and teacher "task force" to assist teams, pre-service and in-service training for teachers, and guidance in evaluating student progress and the efficacy of the program. It is also expected that the Center will spread the principles applied to Pre-Engineering Technology and Project FEAST to districts other than those now served, and will eventually apply the concepts to other occupational fields, such as business or health service.

The Center provided funds to supplement the guidance and resources needed for Capuchino and Ravenswood in 1965-66. It subsequently assumed sponsorship of the program assuring the continuance of Project FEAST by underwriting the 1966 summer workshops in cooperation with the California State Department of Education. This brought five additional schools in the program and a total of ten by September 1966.

ADMINISTRATION

Leadership of the program from its origin has been provided by its director, Hilda Watson Gifford. She is a graduate of the Cornell University School of Hotel and Restaurant Administration and has had extensive experience in operations as well as in high school and junior college training programs. Her most recent activities were in trade association work as Educational Director of the American Hotel and Motel Association. She is an accepted leader of international reputation in this field.

She has been advised by Dr. Louis F. Batmale, Coordinator of Technical-Terminal Instruction, City College of San Francisco. Members of the staff of the Hotel and Restaurant Department at the City College have served as most valuable resource people. The facilities of the College have proved to be indispensable in the conduct of the teachers' workshop and development of the curriculum. The fine foods laboratories, the Alice Statler Library, and the immediate availability of highly qualified resource people account in great measure for the success of the project.

The Director has principal responsibility for:

1. Selection and recruitment of possible high schools;
2. Planning, organization, and administration of the workshop, field trips, and conferences for teachers;
3. Development of a continuing program of training for teachers and counselors providing necessary resource persons and materials.

The Director also assists participating schools in the following way:

1. Establishment of criteria for selection of students;
2. Recruitment of students through conferences and parents' meetings;
3. Supervision of teachers;
4. Establishing liaison with advisory groups from industry, local labor, and management organizations;
5. Establishing liaison with other industry foundations, institutes, and councils.

The sponsorship of the program in June of 1966 passed from the Hotel and Restaurant Foundation to the Center for Technological Education. However, a close liaison has continued with the City College of San Francisco. Dr. Batmale continues to advise, and his staff members act as resource people. The facilities of its Hotel and Restaurant Department will be used for the teachers' workshop as well as a resource for student orientation. The Alice Statler Library strengthens teacher training and curriculum development.

STUDENTS

The program has appealed to both boys and girls. The proportion of boys to girls has ranged from all-boy programs to others having about half of each. The ability range has been broad with a heavier representation from the lower ability groups. Early evidence indicates that this latter group is now staying in school, becoming better citizens, developing employable skills, and performing quite satisfactorily in the school and industry responsibilities assigned to date. A more formal evaluation is planned, and there is reason to be optimistic as to its favorable findings.

Among the schools selected, two have a preponderance of minority group students; one is mixed with a predominantly lower middle class population; one Caucasian lower middle class; and one essentially middle class. The program, it appears, appeals to and affords opportunity for youth from the whole student population regardless of color, ability, or economic status. The primary prerequisite from the students' point of view appears to be interest and motivation.

PROGRAM OF INSTRUCTION: CLASSES AND SCHEDULING

The program does not neglect strong basic education, but supplements it with practical experiences and training. Homemaking department classrooms are used to teach the basic principles of foods preparation and service along with the application of science, math, business, and English. These latter subjects are taught by members of a team; instruction reinforces laboratory experiences and vice-versa. The material covered therein is so oriented that the motivation, skills, understandings, and attitudes learned in the laboratory and cafeteria may be used to good advantage.

It was originally planned that quantity foods preparation and service training as well as purchasing, store, control, and care of supplies and equipment would take place in the school cafeteria. Administrators and team leaders have shown intelligent initiative in meeting these requirements. Some are using their school facilities, some are using those of other schools and one, which has no adequate facilities, has worked out an agreement with nearby Veterans' Hospitals.

All teachers have used the ideas developed in the Pre-Engineering Technology Program, especially its emphasis on practical rather than theoretical concepts, team teaching, and cutting across traditional departmental lines. Teachers have emphasized the relationship between subject matter and what is important to the student in terms of his getting and holding a job.

Considerable latitude has been given to each school in the scheduling of the various subjects. As a result, there is some variation among the schools. There is little variance, however, among the eleventh grade curriculum. In the twelfth grade, adjustments are made to accommodate the more specific needs of the students, the facilities and the community. However, the following allocation of time seems quite representative of the program:

11th Grade

Foods Laboratory and Cafeteria Work.....	2 hours
Foods English.....	1 hour
Foods Business.....	1 hour
Social Studies.....	1 hour
Physical Education.....	1 hour

12th Grade

Foods Laboratory (Cafeteria)..... (1st semester)	2 hours
Outside Work Experience..... (2nd semester)	2 - 4 hours
Foods English.....	1 hour
Elective.....	1 hour
Social Studies.....	1 hour
Physical Education.....	1 hour

The science requirement is met in the home economics class; this includes materials dealing with chemistry of foods, food sanitation, some physics including heat and light, properties of metals, refrigeration, use of electronics, radiation, and steam and quick freezing equipment.

The first semester laboratory work is offered in the home economics facilities and covers the basic principles of foods preparation and science. The following two semesters of the laboratory take place in the cafeteria kitchen, faculty

dining room, or other approved facilities. Adequate laboratory space for a minimum of fifteen students and service for preferably a minimum of 50 persons is recommended. Scheduling is developed around the luncheon hour requirements. The fourth semester is usually spent in a cooperative work experience in local industry.

Success in getting this portion of the program underway has varied from fair to excellent. Critical factors in launching this aspect of the program have been:

1. Administrative -- good working relationship with the Advisory Committee;

2. Adequate time allowance for team members responsible for student placement; and

3. Imagination and initiative of team leader.

Classes in social studies and physical education are taken with the general student body, thus completing the program. Evidence of Project FEAST's unity, team spirit, and high morale are frankly visible, yet the students are not isolated. They do participate in school activities and athletics.

TEACHER TRAINING

The first two weeks of the summer vacation are spent in workshop at the City College of San Francisco. The teachers are exposed to the two-year program in capsule form, getting acclimated to the industry point of view through actual experience in quantity foods preparation and service, through conferences with industry representatives, and through visits to hotels and restaurants. Two additional weeks are spent in the development of the overall outline of curriculum and, more specifically, the course content for grade eleven. The teachers second summer in the four-week workshop is spent revising their 11th grade course outlines and developing the 12th grade curriculum. Dr. Mildred B. Barnard heads this phase of the work. She is especially well qualified due to her industry involvements in the past as well as her research and curriculum development work.

Resource materials are made available to each teaching team for the development of the curriculum outline. All the resources of the Alice Statler Library and the training materials developed in high schools throughout the country are available, The Council on Hotel, Restaurant, and Institutional Education is studying and collecting all of these materials under a U. S. Office of Education grant. The product of this task should be available in the summer of 1967.

In addition, courses and teaching guides from the American Hotel and Motel Association, Educational Institute are

made available for background instructional material. Other tested instructional materials, such as the complete set of manuals used in the Erie County Technical Institute Commercial Foods courses, the City College of San Francisco Hotel and Restaurant Department manuals, the Chadsey High School's "Quantity Cooking" and others are used.

The Alice Statler Library is always open to participating faculty members. It provides the best reference library west of the Mississippi in the field of public housing and feeding.

The teams from all the schools are brought together for a Saturday meeting once each semester. Teams report on developments in their schools; instructors in each discipline meet and exchange ideas; new resource materials are introduced and made available; and problems are aired and brainstormed.

In addition to all this, the Director and the advisors at the City College of San Francisco are available to the individual teams on a continuing basis.

A PLAN OF INDUSTRY AND LABOR INVOLVEMENT

An advisory committee from industry has been developed for each of the schools. The school administrators meet with their advisory committee prior to starting a FEAST program. They serve as resource people for instructors and counselors; they assist in the workshops and conferences, and in the development of work experience and placement programs. A sampling of their activities are outlined below.

A. Working with Counselors

1. They make career material available and participate in "Career Days".

2. They align and make available the resources of:

a. Local associations and organizations;
b. National Council on Hotel, Restaurant, and Institutional Education;
c. American Hotel and Motel Association;
d. National Restaurant Association.

B. Working with the Director and school staffs

1. They act as resource people for teachers in curriculum matters.

2. They participate in meetings, P.T.A., Business Education.

3. They develop scholarship programs and help to make available:

a. Statler Foundation Award and Grant Programs;
b. Council on Hotel, Restaurant, and Institutional Education Listing of Scholarships.

4. They participate in evaluation of programs.

C. Working with students

1. They confer with and guide in career matters.

2. They provide field trip experiences.

3. They make available work experience, part-time and full-time work opportunities.

4. They make necessary evaluation of programs and of student performance.

This brochure has been compiled by the Vocational-Technical Division to inform and assist local school administrators and staff, vocational advisory committees, and others concerned with the development of area vocational-technical programs in Rhode Island.

Since this publication is actually a collection of separate policy statements and guidelines, the pages have not been consecutively numbered.

Additions will be made from time to time to provide the latest information and guides as they are formulated.

Application for Area Vocational-Technical Educational Program	1 through 12

PLAN FOR THE ADMINISTRATION
OF
VOCATIONAL-TECHNICAL EDUCATION
AT THE
SECONDARY LEVEL
IN THE
STATE OF RHODE ISLAND

I. Policy

It is recommended that:

1.) Technical and vocational education at the secondary level in Rhode Island be established in selected regional comprehensive high schools in Grades 11 and 12. This recommendation is based on the philosophy that vocational education must be kept in the mainstream of education, that the kind of education provided in a comprehensive high school is the best preparation for the demands of living in today's society, and that industry is best served by workers whose vocational-technical training is supported by a strong and meaningful academic program. It is recognized that a proper balance must be maintained between the academic and vocational and that the objectives of the vocational-technical program must not be eroded. Controls are written into the plan to assure this. The recommendation is further based on factual information provided by the consultants, by visitations to schools by the consultants and staff and by conferences with local school administration.

2.) The Board authorizes the expenditure of funds for construction (additions to present facilities or new building) of occupational and vocational facilities at certain selected comprehensive high schools which shall be designated as area schools, for purchasing equipment, and, in certain instances (defined later in this plan) for staffing the program; such expenditure to be allowable in the vocational areas per se, or in the academic and related areas when additional space or services are required to support the vocational program.

II. Control

It is recommended that:

1.) A policy of local control be established for all area schools.

2.) The acceptance of the following State standards by both receiving and sending schools to be a prerequisite for participation and receipt of State and/or Federal subsidies.

a. Objective of Instruction

All students accepted in the receiving school will have an objective which is a matter of record. The objective may be a specific recognized occupation or a cluster of closely related occupations in an occupational field.

b. Offering of Vocational Instruction

In establishing, continuing or terminating a program of vocational-technical instruction, the interests, needs, and abilities of all persons in the State and/or area and the need and opportunity in the employment market will be considered.

c. Access to Vocational Instruction Offered

In areas that do not provide specific programs to meet individual needs, the individual may request acceptance at another area school provided facilities are reasonably available for additional enrollees in the program offered by the receiving area school.

d. Selection of Students

Individuals will be admitted for enrollment in classes and provided instruction for each type of occupation or occupational field on the basis of:

a) A standard of achievement met by students so as to meet the requirements for completing the previous grade satisfactorily.

b) A satisfactory citizenship and attendance record.

c) Consideration of aptitude, achievement and intelligence tests for acceptance and placement purposes by the coordinator of the receiving school.

d) Recommendation of the sending school.

e. Soundness and Quality of Instruction

The program of instruction will be based on a consideration of the skills and knowledge required in the occupation for which the instruction is being provided, and should include a planned course of study based upon a logical sequence of those essentials of experience and/or education deemed necessary for the individual to meet his objective.

f. Counsel and Advice

The program of instruction will be developed and conducted in consultation with the Associate Commissioner, area policy committee, the area

advisory committee, potential employers and other individuals or groups having skills and substantive knowledge of the occupation or occupational field representing the occupational objective.

g. Cooperative Work Experience

Cooperative work arrangements may be made for twelfth grade students to provide on-the-job experiences.

The program will provide for the following:

a) Employment of student-learners in conformity with Federal, State and local laws.

b) Employment in a manner which discourages and prevents exploitation of student-learners for private gain.

c) Supplemental instruction be provided by the area school.

h. Adequate Facilities, Equipment and Materials

Classrooms, libraries, shops, laboratories, and other facilities including instructional equipment, supplies, teaching aids and other materials will be adequate in supply and quality to meet the occupational objectives for which the education is intended.

i. Qualified Teachers and Supervisors

Instruction will be conducted and supervised by teachers and supervisors meeting state certification requirements. The State Board will make provision for a pre-service and in-service teacher training program to provide for a sufficient supply of qualified persons.

3) The Associate Commissioner of Vocational-Technical Education in the State Department of Education be designated as the person to determine compliance with the standards; to assist in establishing and conducting programs; to serve as liaison between the State Department of Education and the schools; and to work cooperatively with the area coordinator in all areas of the program.

4) An area liaison committee be established consisting of the superintendent and one member of the school committee, from each participating school system, such member to be appointed by the respective committee. This committee will act as the liaison agent between the sending and receiving school districts and will assist in the development of short term and long range plans for the improvement and expansion of the program.

5.) An area advisory committee be established consisting of representatives from business, industry and education in the participating communities to advise on program offerings in light of the needs of the area.

6.) An agreement be entered into between the State Board of Education and the school committee of the community where the school designated as the area school is located: both parties to agree to the designation of the area school, the school committee to agree to provide water, heat, light, janitorial services, adequate teaching staff, supplies, textbooks and any other services required to maintain standards; the State Board to agree to provide certain construction, renovating, equipment and administrative and guidance staffing. (Details of the Agreement to be worked out with legal counsel.) The school committee would also agree that the facilities be available for upgrading, retraining and similar programs approved by the State Board of Education.

When possible, workshops for persons who have socio-economic or other handicaps that prevent them from succeeding in the regular vocational programs should also be provided.

7.) The state maintain title to the building(s) constructed and the equipment purchased with State and/or Federal funds.

III. Administration

It is recommended that:

1.) The principal of the area school be directly responsible for the operation of the school, including the vocational program under the direction of the superintendent of schools.

2.) An area coordinator be appointed by the school committee of the area school with approval of the Commissioner of Education, to be responsible to the principal of the school; his salary to be set by the school committee with the approval of the Commissioner of Education and to be reimbursed 100% by the state.

3.) Vocational counselors be appointed by the school committee with the approval of the Commissioner of Education at the ratio of at least 1 to 200 vocational students; their salaries to be set by the school committee consistent with the local school pay plan and to be reimbursed 100% by the state.

4.) The area coordinator be employed as soon as possible and vocational counselors be employed at least six months prior to the opening of the school.

5.) All other teachers and school personnel be appointed by the school committee.

6. The program of studies be established by the school committee with the assistance of the Associate Commissioner, area policy committee, the area advisory committee, potential employers and other individuals or groups having skills and substantive knowledge of the occupation or occupational field representing the occupational objective.

7. Individual student scheduling be determined by the area school but with cooperative planning by the sending school.

8. Tuition be charged by the area school to the sending school in an amount not to exceed the per capita cost of operation, either in the entire school or in the vocational program, whichever is more equitable.

9. Transportation be the responsibility of the sending school committee.

10. Admission quotas for each community in the area be made on a percentage basis determined by the most recent October enrollment figures for the 10th grades in all schools; that applications for admission be screened by a committee consisting of the area coordinator and the vocational guidance counselor in conjunction with appropriate staff from the sending school; and that final responsibility for admission rest with the area coordinator.

PROCEDURES FOR APPROVAL OF VOCATIONAL-TECHNICAL EDUCATION AT THE SECONDARY LEVEL IN THE STATE OF RHODE ISLAND

Procedures for Approval
of
Vocational-Technical Program

Initiated by	Procedure
Associate Commissioner of Vocational-Technical Education	1. Meet with superintendent of school district where program will be established. (a) Explanation of administrative pattern. (b) Discussion of local conditions pertinent to development. (c) Initiation of immediate plans.
Local superintendent	2. Arrange meeting with school committee. (a) Establish willingness to become an area school. (b) Initiate proceeding of acquisition of land for State. (c) Authorize initial planning to continue.
Initiated by	Procedure
Local superintendent and/or Associate Commissioner for Vocational-Technical Education	3. Meet with all superintendents of area to be designated. (a) Review administrative pattern. (b) Discuss local problems.
Local superintendent and/or representative	4. Form a local advisory committee to consist of business, industry and other interested citizens from all communities within a designated area.
Local school representative amd Vocational-Technical Division	5. In conjunction with local advisory committee, survey designated area and initiate a proposal for a vocational program. (Includes curriculum, enrollment data, budget etc.)
Receiving School Committee	6. Review and approve preliminary proposal for the establishment of an area vocational program. (Includes recommendation for a local vocational coordinator.)

Local Superintendent	7. Submit preliminary proposal to Associate Commissioner of Vocational-Technical Education for review.
Associate Commissioner of Vocational-Technical Education	8. Review preliminary proposal and make recommendations to Commissioner.
Commissioner of Education	9. Review proposal and recommend approval by State Board of Education. (a) Approve a written agreement between local receiving school and State Board. (b) Approve local coordinator. (c) Appoint an architect. (d) Final approval and acquisition of site for school.
Area Coordinator and local school	10. Develop the educational program plan in cooperation with the professional liaison committee.
Area Coordinator	11. Review the preliminary draft of the educational program plan with the Associate Commissioner of Vocational-Technical Education.
Associate Commissioner of Vocational-Technical Education	12. Submit the educational program to the Commissioner of Education for acceptance.
Area Coordinator	13. Prepare building space allocations and submit to Associate Commissioner of Vocational-Technical Education.
Area Coordinator and Architect	14. Preliminary building plans submitted to the Associate Commissioner of Vocational-Technical Education.
Area Coordinator with assistance from advisory group	15. Submit detailed equipment layout for each shop and laboratory to Associate Commissioner of Vocational-Technical Education for review.
Area Coordinator and Architect	16. Submit final plans and specifications for building and equipment to Associate Commissioner of Vocational-Technical Education.
Associate Commissioner of Vocational-Technical Education	17. Submit final plans and specifications of building and equipment for approval to Commissioner of Education.

ADVISORY COMMITTEE BY-LAWS

BY-LAWS FOR AREA VOCATIONAL-TECHNICAL ADVISORY COMMITTEE

ARTICLE I. NAME OF ORGANIZATION

The name of the organization shall be the "_____ Advisory Committee of Vocational-Technical Education."

ARTICLE II. FUNCTIONS OF ORGANIZATION

1. To advise local school officials concerning the development of the Vocational-Technical program at _____ Area School.

2. To provide closer cooperation and better understanding of trade and industrial education in industry, business, the home and the school.

3. To advise school officials on the relative emphasis or scope of training needed in various vocational-technical occupations.

4. To recommend facility and equipment innovations and changes to meet the occupational needs of the area.

ARTICLE III. MEMBERSHIP

1. All members shall be appointed by the superintendent of the Area school upon recommendation of the superintendents of the sending communities.

   One-third of the membership of the Committee shall serve for one year, one-third for a term of two years and one-third for a term of three years.

   As the term of each incumbent appointed is to expire, the new member shall be appointed for a term of three years by the superintendent.

2. Any person appointed to membership shall remain a member of the Committee until the person either resigns or fails to attend four consecutive scheduled meetings.

ARTICLE IV. OFFICERS

1. The officers of the Area Advisory Committee shall consist of a Chairman to be elected by the Committee for a period of one year and a Secretary who shall be the Coordinator of the _____ Area School.

2. The Chairman of the Advisory Committee shall preside over the regular and special meetings.

3. The Secretary shall keep minutes of all meetings, care for all correspondence and records of the Committee, and perform all necessary clerical duties.

ARTICLE V. MEETINGS

1. Meetings shall be called as required by the Chairman of the Advisory Committee.

2. The agenda for each meeting of the Committee shall be prepared by the Chairman and the local Coordinator.

3. All meetings of the Area Advisory Committee shall be held at a location designated by the Chairman.

4. The Superintendent shall appoint a temporary chairman for meetings the Chairman is unable to attend.

ARTICLE VI. VOTING

1. Voting privileges shall be extended to all active members of the Area Advisory Committee.

2. A majority of the Advisory Committee shall constitute a quorum.

ARTICLE VII. RULES OF ORDER

1. Parliamentary authority shall be Robert's Rules of Order.

S E C T I O N III

LIST OF SERVICES

PROVIDED BY

VOCATIONAL-TECHNICAL ADVISORY COMMITTEE

LIST OF SERVICES PROVIDED BY

VOCATIONAL-TECHNICAL ADVISORY COMMITTEES

1. Assist educators in making community surveys.

2. Review past accomplishments and forecast trends affecting training and employment.

3. Help determine and verify the need for training in various occupational areas.

4. Provide tangible evidence that industry and business is supporting or will support needed vocational-technical programs.

5. Help establish standards for shop and lab planning and assist in the planning of facilities.

6. Assist in planning course content and help determine the length, scope, and sequence of courses.

7. Establish standards for selecting equipment and instructional materials.

8. Secure donations of equipment and supplies.

9. Interpret the program to the community - management personnel, labor unions and the general public.

10. Provide financial, legislative and moral support for the vocational-technical program.

11. Assist in the evaluation of the program.

12. Assist guidance counselors and other school personnel in the orientation of students to the world of work.

13. Provide accurate up-to-date occupational information.

14. Find placement opportunities for vocational-technical students.

15. Assist in the development of work experience programs for students.

16. Recommend new technical developments which require changes in the curriculum.

*VOCATIONAL AGRICULTURE; *DISTRIBUTIVE EDUCATION; ADVISORY COMMITTEES; *OFF FARM AGRICULTURAL OCCUPATIONS; *EDUCATIONAL NEEDS; *JOB SKILLS; AGRICULTURAL SKILLS; BUSINESS SKILLS
WISCONSIN

The Wisconsin State Agri-Distribution Advisory Committee determined the areas of competencies needed by present and future employees in agri-distribution occupations to be social, basic skills, marketing, agricultural technology, and economics. The Committee, all employers, expressed a growing need for trained persons in the distributive education and business education fields. It was felt that agriculture students would have more employment possibilities if they had the opportunity to have training in distributive education and business education. Some conclusions were: (1) There is a need for trained agri-business employees, (2) The agri-distributive businesses desire employees skilled in the competencies named, (3) Students preparing for employment need education in more than one discipline or vocational area to become more fully employable, and more likely to reach their potential, and (4) The State Department of Public Instruction will encourage several schools to instigate demonstration programs in agri-distribution using a team approach and on-the-job training. A list of agri-business steering committee members and their agriculture relationship is included. (WB)

Agri - Business Competencies. (Title Supplied). 1966 (ed) 4p*

ED030001

The Wisconsin State Agri-Distribution Advisory Committee determined the following competencies needed by future and present employees in agri-distribution occupations in the order of importance:

1. Social competencies. Competencies in this category that were rated the highest were human relations, attitudes, ethics, and supervisor skills.

2. Basic skills. The competencies rated the highest in this category were reading and speech.

3. There were two categories tied for third place. These were marketing and agriculture technology.

   Marketing. The highest rated competencies needed were salesmanship and service, marketing, advertising, and market research.

   Technology of agriculture. Competencies with the highest ratings by the advisory committee were plant and soil science, farm vocabulary, animal nutrition.

4. Economics. Competencies in this category rating the highest were agriculture related economics, pure economics, and the free enterprise system.

The advisory committee felt that one man could not be competent enough in both distribution and agriculture education. An exception would be possible wherein a present ag-instructor may have enough experience in the occupational field of marketing and distribution to warrant his enrollment in college courses in distribution to be certifiable in the teaching field of marketing and distribution. The Department of Public Instruction would certainly encourage such persons to submit proposals through their school district to the Department for agri-distribution programs after a sufficient planning.

Without exception, all of the advisory committee, who were employers, indicated a need for trained people. In addition, Mr. Cibarich of the Wisconsin State Employment Service reported to the committee that between 1950 and 1960 there was a 14 percent increase in all types of sales occupations. He also said we have vastly improved our ability to produce. Now, the distributive function is becoming more important in our economy.

VT003695

From the recent survey of a sampling of the agriculture programs, 10 years or older, it was determined that 37 percent of vocational agricultural graduates go back to the farm. An additional twenty-two percent go into occupations with some relationship to agriculture. Mr. Dale Aebischer, Chief of Vocational Agriculture for the State Board of Vocational Education said, "We can see more employment possibilities for the ag boys if they have an opportunity to become involved in distributive education and business education. Between 15 and 20 percent of vocational agriculture boy graduates go on to college.

OFFICE OF EDUCATION

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

CONCLUSIONS

A. There is a need for trained agri-distributive employees.

B. It is apparent that agri-distributive businesses would like to have employees skilled in human relations, basic skills, marketing and agriculture technology, as well as economics.

C. It is apparent that students who are preparing for the "world of work" need education in more than one discipline or vocational area in order to become more fully employable and more apt to reach their potential.

D. Marketing and Distribution Education should be expanded on the high school level for two reasons: (1) to provide an interdisciplinary approach to agri-distributive occupations, (2) to help the many students entering careers in marketing and distributive occupations to become more employable and successful.

In view of the above insights, the State Department of Public Instruction will encourage several schools to instigate demonstration programs in agri-distribution using a team approach. One school, Plymouth High School, is beginning in September 1966 with such a program. Students will receive one year of traditional ninth grade vocational agriculture, one year of farm mechanics and in the senior year will take cooperative distributive education wherein the students will be placed in agri-distributive occupations for on-the-job training.

*MANPOWER UTILIZATION; YOUTH EMPLOYMENT; LABOR FORCE; *UNEMPLOYMENT; *EMPLOYMENT TRENDS; AGRICULTURAL LABORERS; FEDERAL LAWS; *ADULT VOCATIONAL EDUCATION; *FEDERAL PROGRAMS; DISADVANTAGED GROUPS; YOUTH PROGRAMS; YOUTH EMPLOYMENT
MDTA PROGRAMS; *MANPOWER DEVELOPMENT AND TRAINING ACT PROGRAMS

The total number of people at work rose by 1.8 million, or 2.5 percent, during 1965. The unemployment rate dropped from an average 4.6 percent during 1965 to 3.7 by February 1966, the lowest level of joblessness in 13 years. Although pockets of unemployment remained a serious problem, personnel shortages were emerging in some occupations and geographic areas. Between 1965 and 1970, the labor force is expected to grow by over 1.5 million per year. Service-producing industries and clerical workers are expected to be the fastest growing occupational groups. Economic, human, and social costs of unemployment and underemployment are to be combated with several new and revolutionary manpower programs authorized by Congress since 1961 to help upgrade worker skills and prepare the disadvantaged for employment. Programs such as the Manpower Development and Training Act, the Neighborhood Youth Corps, the Job Corps, and Youth Opportunity Centers are training the increased youth labor force. Decreasing farm employment will require better education and training for nonfarm occupations, and economic development of rural areas to reduce the pressure on farm people to move to cities in search of work. However, job opportunities for domestic farm workers were improved by curtailing employment of foreign workers. Conclusions, recommendations, and policy implications are summarized at the end of each of six sections which correspond to those in the complete report. Ten graphs and one data table from the full-report are included. The complete report is available as VT 001 162. (ET)

HIGHLIGHTS FROM THE 1966 MANPOWER REPORT

A SUMMARY OF THE REPORT
TRANSMITTED TO THE CONGRESS

Preface

Each year, the President sends to the Congress a Manpower Report, as required by the Manpower Development and Training Act of 1962. The report is printed as one volume containing: (1) A message from the President and (2) a comprehensive report by the Secretary of Labor on the Nation's manpower requirements, resources, utilization, and training.

This booklet presents highlights of the *1966 Manpower Report.*

For information on how to obtain the complete report or reprints of the President's message and individual chapters, see inside of back cover.

Excerpts from

MANPOWER REPORT OF THE PRESIDENT

I report on a year of progress and fulfillment.

I report on a year of challenge and change.

February 1966 marked the twentieth anniversary of this Nation's 1946 commitment to provide job opportunities for every person able, willing, and seeking to work.

February 1966 also brought the fifth anniversary of our longest and soundest period of peacetime prosperity. It marked the 60th consecutive month of visible proof that the 1946 commitment can be met.

Five years of sustained economic growth have effectively demonstrated that this Nation can:

1. Pursue an economic policy which creates millions of new jobs and reduces the burdens of unemployment and poverty.

2. Provide the necessary job opportunities to convert a flood of teenagers into a valuable national resource instead of an urgent social problem.

3. Set in motion manpower programs to transform the deprived, the disadvantaged, and the despairing into effective and self-respecting members of the Great Society.

* * * * *

With all that we have accomplished so far, with all that we are doing now, it is time to ask again: What of the future?

The future can be and ought to be a time of opportunity.

I see a future where the first two decades of people's lives are spent growing up, physically and mentally fit—training for citizenship and

effective participation in their country's affairs—attaining the education for service, for a craft, for a profession—getting ready for their roles as workers, consumers, producers, and contributors to a free society.

I see a future in which education and training will be a permanent bridge between learning, employment, and human development. Even as we develop new uses of technology, we recognize that people grow stale unless there is a continuous renewal of their knowledge, enrichment of their skills, and development of their talents.

I see a future in which those seeking a station in life—whether it be the young dropout, the first offender, the older man with an outdated skill, the military rejectee—will have an opportunity to fulfill their hopes and expectations.

A manpower policy must be based on belief in the value of the individual and in the promise of welcome change.

A manpower policy should lead us to a society in which every person has full opportunity to develop his—or her—earning powers, where no willing worker lacks a job, and where no useful talent lacks an opportunity.

Lyndon B. Johnson

LYNDON B. JOHNSON

HIGHLIGHTS OF THE 1966 MANPOWER REPORT OF THE DEPARTMENT OF LABOR

Full employment is a first-priority objective for our country, and one which we are much closer to attaining now, in early 1966, than at any time since the early 1950's. A remarkable 5-year gain in employment reduced the unemployment rate to 3.7 percent in February 1966 from about 7 percent in early 1961.

This expansion in employment and reduction in unemployment was brought about largely by unprecedented Government action involving both fiscal and monetary policy and training and other manpower programs. The progress we have made toward full employment is very heartening.

Nevertheless, the country faces two serious manpower problems. Unemployment is still much too high among young, nonwhite, unskilled, and otherwise disadvantaged workers. At the same time, shortages of trained workers are emerging in a good many occupations and geographic areas.

The challenge is to solve both these problems. We must give disadvantaged workers the training and other help they need to qualify for productive jobs. We must also enlarge our training programs in occupations with labor shortages and take steps to insure that workers with scarce skills are used as effectively as possible. This is essential in order to meet the country's manpower needs, and thus increase production and help to prevent inflation.

Review of Current Developments

The United States Enters Sixth Year of Continuous Economic Expansion

The current expansion in business and employment in the United States entered on its 6th year in 1966. This is the longest period of uninterrupted economic growth in more than half a century, with the single exception of the World War II period.

In the 5 years since the last recession, the Nation's annual output of goods and services has increased by 30 percent. Most of this gain was achieved through greater output per worker, brought about by new technological developments and other factors. However, there was also some increase in the number of workers—about 9 percent over the 5-year period.

Employment grew much faster in 1965 than in any of the 4 preceding years. The total number of people at work rose by 1.8 million, or 2½ percent, during 1965. Greater civilian demand for goods and services chiefly accounted for this employment expansion, although increased military demand also contributed to it toward the end of the year.

The large increases in output and employment provided a happy resolution to a problem that had been foreseen many years before—that the great number of postwar babies reaching working age in the midsixties might not find enough new jobs to provide employment for all. However, direct action by the Government to keep the economy growing at a rapid pace proved successful. An employment rise of 1.8 million in 1965 exceeded the growth in the labor force to the extent that 400,000 of the additional jobs were filled by the unemployed.

The result was a substantial drop in the unemployment rate—to an average of 4.6 percent during 1965 as a whole, compared to 5.2 percent during 1964. By February 1966, the rate had dropped to 3.7 percent, the lowest level of joblessness in 13 years.

Jobs Increased in Almost All Industries and Occupations in 1965

Almost all major nonfarm industries and occupations made gains in employment in 1965. The exceptions were mining, transportation, and the Federal Government. And agricultural employment continued to drop.

221-349 O-66-2

More than half the additional jobs were in service-producing industries. The employment gains were largest in trade, State and local governments, and business, professional, and personal services. (See chart 1.)

Chart 1 **Recent job growth has been spurred by the goods-producing and related industries, especially manufacturing and construction.**

Employment in the service-related sector — except Federal Government — continued its sharp rise.

Source: U.S. Department of Labor.

Chart 2 **Turnabout in trend of blue-collar employment has been feature of current expansion.**

Source: U.S. Department of Labor.

Employment rose also in the goods-producing industries, especially manufacturing and construction. This was a striking development because of the generally downward trend of employment in these industries during the postwar period; their upsurge provided an especially welcome relief for some of the knottiest unemployment problems. Manufacturing and construction accounted for two-fifths of the rise in the number of jobs during 1965, with total employment in manufacturing exceeding the peak reached during World War II for the first time. The gains in manufacturing employment reflected, in large part, strong consumer demand for durable goods, particularly automobiles.

Greater manufacturing employment meant more jobs for blue-collar workers. (See chart 2.) Semiskilled operative jobs rose by more than

460,000 last year, skilled craftsman and foreman jobs by 235,000. Employment of industrial laborers increased by 230,000 after remaining at about the same level for more than a decade.

The increase in operative and laborer jobs benefitted the less skilled and more disadvantaged groups of workers with high rates of unemployment, including many Negroes. More opportunities were also created for teenagers entering the labor force without experience or skill, although this age group continues to be particularly vulnerable to unemployment.

Employment in white-collar jobs continued to rise even more than blue-collar employment, though the difference was much less than in most previous postwar years. Altogether, the number of people in professional, managerial, clerical, and sales jobs rose by almost a million between 1964 and 1965. Among white-collar as among blue-collar workers, the less skilled groups—clerical and sales—showed the sharpest gains in the past year. Thus, as the current economic expansion has lengthened and accelerated and as the job market has tightened, the rising demand for labor has been especially reflected in expanding job opportunities for less skilled workers. This represents a marked change from earlier postwar years, when employment opportunities for these workers have generally been much less favorable.

Government Policy Had a Key Role in Stimulating and Sustaining Economic Growth

These gains in output and employment resulted from Government policies aimed at sustaining economic growth and using fully the Nation's manpower and other productive resources. Many of these policies have broken new ground.

Beginning in 1961, the Federal Government took action to stimulate recovery from the recession that had begun in early 1960. Social security benefits were increased, unemployment insurance benefits were extended, and Federal expenditures for highway construction and other programs were increased. However, it soon became clear that the economy was still not growing fast enough to generate jobs for the rapidly increasing labor force—much less to reduce the unemployment rate, then 5½ percent.

The Government accordingly undertook a number of related actions all designed to stimulate economic growth. The most important was the cut in individual and corporate taxes which became effective in 1964. The tax cut and other fiscal measures, including greater tax credit for investment, stimulated expenditures by consumers and businessmen. They were largely responsible for the continued expansion in production and employment of the past 2 years.

In addition to these broad monetary and fiscal measures, the Government moved in other ways to reduce the social and economic waste which results from unemployment and underemployment. New training and other manpower programs were undertaken to equip jobless workers with needed skills and otherwise aid in matching workers and jobs. Training of jobless workers became part of the program for redevelopment of depressed areas under the Area Redevelopment Act of 1961. A considerably larger system of training was launched under the Manpower Development and Training Act of 1962, and intensive research was undertaken to develop manpower programs aimed at achieving full employment. The War on Poverty inaugurated in 1964 has also involved a variety of programs aimed at improving the employability of the most disadvantaged groups.

These manpower programs have already helped to reduce unemployment, especially among young people, and they are expected to have even greater impact as time goes on. It is estimated that in December 1965 at least 90,000 young persons in on-the-job training under the MDTA and in War-on-Poverty programs would otherwise have been unemployed.

Pockets of Unemployment Remain a Serious Problem

Nevertheless, unemployment remains much too high among particular groups of workers and in particular parts of the country.

The rate of unemployment among teenagers is about three times the overall average rate. In 1965, it was 13 percent for boys and 14 percent for girls. For nonwhite teenagers, the rates were very much higher—23 percent for the boys and 30 percent for the girls. Negroes as a group have an unemployment rate about twice the general average. Also, although long-term unemployment has dropped notably, about 1 of every 5 unemployed workers has been jobless for 15 weeks or longer.

Seventeen of the 150 major labor areas in the country—1 out of every 8—have an unemployment rate of 6 percent or more. Most of these areas have been struggling with problems of chronic high unemployment for many years, as a result of declining industries or lack of economic development. In many rural areas surplus labor is a serious problem because of the long-continued drop in farm employment.

Eliminating these tragic and wasteful pockets of unemployment is one of the chief goals of our manpower programs and policies. In our democracy, the objective must be to insure that every citizen has opportunity to develop his abilities fully and to use them fully in his own and the Nation's interest.

Manpower Shortages Are Emerging in Some Areas and Occupations

Although there are still close to 3 million unemployed, personnel shortages are emerging in some occupations and areas. These shortages may become more acute as the economy continues to grow and the pool of unemployed becomes smaller. In a third of the 150 major labor areas no more than 3 percent of the workers are unemployed. Some areas even have an unemployment rate below 2½ percent—indicating generally full employment and allowing only for job changing. Professional and technical workers and craftsmen—particularly engineers, teachers, scientists, tool and die makers, machinists, other skilled metal workers, and repairmen of some types—are in short supply in a good many areas.

The increased military buildup may be a factor in further tightening of the manpower situation. Stepped-up American activity in Vietnam led to a 10-percent expansion in employment in major defense-related industries during 1965. Larger defense expenditures this year would certainly lead to further expansion in these industries and would also have an impact on the economy generally. At the same time the increase in the Armed Forces proposed by the President in January would considerably reduce the number of young men entering the civilian labor force this year.

Nevertheless, the country has large manpower resources which can be drawn on to meet its manpower needs. The largest of these resources is the expected increase in the labor force; the number of people added to the work force annually is expected to average 1½ million for the next few years. In addition, there are still some people among the unemployed who have skills needed by employers and many more who could be trained. A third resource consists of the great numbers of underemployed workers—those who are currently working only part time or who are in jobs not using their abilities fully.

The country also has a great many adult women who might be drawn into the work force if offered suitable jobs. Despite current labor shortages, many firms are not hiring women workers at all, or are relegating them to only a few traditional "women's jobs." The Negro work force is also greatly underutilized; in many areas Negroes are still barred from advancement in the skilled trades.

Labor shortages can be relieved also by more efficient use of the current supply of professional and skilled workers. By redesign of their jobs, these highly trained people can be relieved of tasks not demanding a high level of skill, and these tasks can be assigned instead to less skilled workers. The progress which can be made along this line is illustrated by developments in the health professions, where personnel shortages have been acute for a long time. In nursing, for example, many tasks have been taken over by nurse aides, orderlies, and other assistants, so that the professional nurses are free to devote their full time to the responsibilities only they can handle.

The likelihood of growing personnel shortages in some occupations and geographic areas as the country approaches full employment presents a challenge to manpower policy. Efforts must be made to foresee emerging shortages, to train workers to meet current and prospective occupational requirements, and to otherwise improve the matching of workers and jobs.

The training programs conducted under the Manpower Development and Training Act of 1962 are one means of helping to meet the economy's immediate need for trained workers, while enabling unemployed people to qualify for jobs. About 35 percent of the MDTA training in fiscal 1967 will be directed specifically toward meeting skill shortages. The rest of the training will be directed toward disadvantaged youth and adults, who generally need not only skill training but basic education and other services to become productive members of the work force.

The Federal-State employment service system has a central role in carrying out the country's manpower policies and programs. A strengthened Employment Service, separated from the unemployment compensation system and under a new legislative mandate, would do much to insure effective manpower programs. Legislation which would make possible the needed strengthening of the service has therefore been recommended to the Congress.

Another approach to meeting skill shortages is through the pilot programs now underway to encourage and assist the movement of unemployed workers to places where their skills are needed. Efforts are also being made to break down bias against hiring particular groups—older people, women, people of limited education, and members of minority groups—who may have needed skills.

The efforts of the Government in all these areas must be supplemented by private action to increase training and upgrading of workers and to overcome the discriminatory and other barriers which now prevent full use of the country's workers and potential workers.

The Manpower Outlook

Rapid Growth in the Labor Force Expected Through 1970

The United States will have about 86 million workers by 1970, almost a fifth more than in 1960. Between 1965 and 1970, the labor force is expected to grow by over 1½ million per year. This would be an average annual increase half again as large as occurred during the past 5 years and almost double the average increase in number of workers during the 1950's.

Teenage and young adult workers—born since World War II, when birth rates have been high—will increase especially fast. The number aged 14 to 24 will rise by almost 700,000 a year between 1965 and 1970—making up about 45 percent of the expected total increase in the labor force.

Women will continue to enter the labor force in growing numbers—partly because of the expanding employment opportunities expected in part-time jobs and in service and office occupations. Between 1965 and 1970, the number of women workers aged 25 and over may rise by 430,000 per year.

About 4 out of every 5 of these additional women workers will be 45 years of age or older. More and more women are entering or returning to work at this point in their lives, when they no longer have young children to care for.

The total number of men workers past 25 will also rise significantly, after remaining about the same for many years. There will be more men aged 25 to 34, and more aged 45 and over. On the other hand, men workers aged 35 to 44 will decrease by about 115,000 per year up to 1970, reflecting the low birth rates of the early 1930's. Men of this age normally fill many middle-management positions and other highly responsible and skilled jobs. So the reduction in their number could lead to shortages of key personnel, open new opportunities for the growing numbers of younger and older workers, and require major training efforts.

Sharp Economic and Employment Growth Required for Full Employment

Employment will have to rise to about 81 million by 1970 if we are to employ these additional workers, while reducing the unemployment rate further (to 3 percent). This total would represent a rise of about 2½ percent in civilian employment over the next 5 years.

221-349 O-66-3

Chart 3

Percent change in employment, by industry, 1960-65, and projected 1965-70

Source: U.S. Department of Labor.

A rapid increase in real gross national product will go hand in hand with this increase in employment. GNP would have to grow at an average rate of 4½ percent over the next 5 years to meet our full employment goal.

This 4½-percent rate of GNP growth would be well above the average growth rate achieved during the post-World War II period as a whole (3¾ percent). On the other hand, it would be substantially less than the GNP growth rate in the last 2 years.

If a 4½-percent rate of GNP growth is attained during the next 5 years, the Nation's total output of goods and services will be one-fourth higher in 1970 than in 1965. This would make possible a further rise in our average standard of living, besides helping to meet the needs of national defense and the country's international commitments.

Employment Growth Expected to Speed Up in Most Industries and Occupations

Employment is expected to grow faster between now and 1970 than in the past 5 years in most major industries (assuming unemployment is reduced to 3 percent).[1] In manufacturing and in finance, insurance, and real estate, however, employment will probably increase at about the same or a slower rate than in the last several years. And in agriculture and mining, where employment has been dropping, the decrease is expected to continue at a slower pace. (See chart 3.)

In nonfarm industries generally, wage and salary employment is expected to rise to nearly 69 million by 1970 from 60.4 million in 1965, or by 14 percent.

Construction is the only major goods-producing industry in which employment is likely to rise as fast as nonfarm employment as a whole. A gain of 15 percent in construction jobs is projected between 1965 and 1970—because of expected increases in construction by State and local governments, growing needs for residential housing, and expanding business investment in new and improved plants.

Service-producing industries offer the brightest prospects for employment growth. Between now and 1970, employment in these industries as a group is expected to increase by 18 percent, with the most rapid rise (33 percent) in State and local government employment.

[1] The following represent a few key findings from a new study of manpower requirements in major industries conducted cooperatively by the Department of Labor and several other Federal agencies. The figures are preliminary findings from this comprehensive study, which has utilized the input-output technique to derive industry employment estimates from patterns of final demand for goods and services. See *1966 Manpower Report*, p. 39.

Chart 4

Employment growth in most occupations will speed up over next half decade.

1/ 1965-70 employment of nonfarm laborers is projected at about the absolute level of the past decade.

Source: U.S. Department of Labor.

Employment growth will also speed up in most occupations over the next half decade. However, professional, technical, and kindred occupations will continue to be the most rapidly growing group. By 1970, about 11 million workers may be needed in these occupations—about one-fourth more than in 1965. (See chart 4.)

Clerical workers are expected to be the second fastest growing occupational group and to number 13 million in 1970. Service workers—who include people in such varied occupations as policeman, barber, waiter, and hospital orderly—will increase almost as fast as clerical workers. In 1970, there may be about 11 million service jobs, over a sixth more than in 1965.

Among manual workers, skilled craftsmen are expected to have the most rapid increases in employment over the next 5 years. Their number may rise from 9.2 million to 10.4 million between 1965 and 1970—with the fastest employment growth expected for mechanics and repairmen, building trades craftsmen, and foremen. In contrast, only modest employment increases are expected in semiskilled operative jobs, and no rise in the number of nonfarm laborers.

Farmworkers are the only major occupational group expected to decrease significantly over the next 5 years—pointing to the special need for retraining and other aid to farm people in preparing for and adjusting to nonfarm jobs.

Manpower Requirements to Achieve National Goals

Great improvements in the pattern of American life will be possible by 1975 if the country's manpower is fully employed. This is indicated by a study of the manpower requirements for achievement of an illustrative set of national goals now being conducted for the Department of Labor. The study suggests goals to which the country might aspire in 16 major areas, including agriculture, education, health, housing, national defense, space exploration, transportation, and urban development.

Full achievement of all the illustrative goals by 1975 would require a work force of more than 100 million—over 10 million above the number of workers expected 10 years hence with full employment. This means that our manpower resources will not be great enough for attainment of all the suggested aspiration goals within the next 10 years, though they will enable us to make great social progress. So long as goals such as these are seriously pursued as national objectives, the problem for our economy is likely to be an insufficiency rather than a surplus of manpower.

The Hidden Costs of Unemployment

Economic Costs Can Be Heavy

Though recent progress toward full employment is very encouraging, the continuing failure to fully attain this goal imposes heavy costs on workers, their families, and the country generally.

Part of the cost is economic: in the last quarter of 1965, when unemployment was down to 4.2 percent, the loss in gross national product from unemployment above 4 percent was still at an annual rate of $7 billion (according to estimates by the Council of Economic Advisers).

In early 1966, with unemployment well below 4 percent, we are still failing to use all our manpower.

Besides the nearly 3 million totally unemployed, close to 2 million workers are employed part time involuntarily. In addition, sizable numbers of men and women now outside the labor force would be available for jobs if they could be given the required incentives and skills.

Human and Social Costs May Be Even Greater

The human and social costs of unemployment remain largely unmeasured but may be even greater than these economic costs.

Prolonged or repeated unemployment has frequently forced families into poverty and dependency. It often means poor nutrition, poor health, and inadequate medical care.

Prolonged unemployment also has very destructive personal consequences. It destroys the fabric of a man's life. It may erode his skills and motivation to become self-supporting again, and is likely to lessen his civic participation and community ties. It may also contribute to family disintegration. As the Governor's Commission on the Los Angeles riots reported:

> ". . . A family whose breadwinner is chronically out of work is almost invariably a disintegrating family. Crime rates soar and welfare rolls increase, even faster than the population." [2]

Unemployment and family poverty have highly adverse effects on children's education. To quote the Governor's Commission again:

> "In examining the sickness in the center of our city, what has depressed and stunned us most is the dull, devastating spiral of

[2] *Violence in the City—An End or a Beginning?* (Los Angeles: Governor's Commission on the Los Angeles Riots, Dec. 2, 1965), p. 6.

failure that awaits the average disadvantaged child in the urban core. His home life all too often fails to give him the incentive and the elementary experience with words and ideas which prepares most children for school. Unprepared and unready, he may not learn to read or write at all. . . .

Frustrated and disillusioned, the child becomes a discipline problem. Often he leaves school, sometimes before the end of junior high school. . . . He slips into the ranks of the permanent jobless, illiterate and untrained, unemployed and unemployable. . . .

Reflecting this spiral of failure, unemployment in the disadvantaged areas runs two or three times the county average, and the employment available is too often intermittent." [3]

The situation is different, but no less desperate, for the rural poor. Thus, a Kentucky miner called to court by the truant officer said:

"Judge, I'm not the only man in this fix on the creek where I live. They's at least a dozen other men who ain't sent their children to school for the same reasons mine ain't a'goin'. They can't send 'em 'cause they can't get hold of any money to send 'em with. . . . If the county attorney or the truant officer will find me a job where I can work out something for my kids to wear, I'll be much obliged to 'em as long as I live." [4]

Some Implications

Altogether, the costs of unemployment and underemployment to our economy and to individual Americans are so high as to compel attention and action. In this time of emerging skill shortages and possible inflationary pressures, our economy can ill afford the waste involved in unused or underutilized human resources. And still less can our democracy tolerate the consequences of joblessness and poverty for individuals.

Further progress towards full employment may not be easy. Most workers who can find jobs readily are now at work (or unemployed for short periods while moving from one job to another). To achieve full employment of the hard-to-employ will require intensive efforts to overcome barriers and handicaps of many kinds—geographic mismatching of workers and jobs, lack of education and training, physical and mental handicaps, and discrimination in many forms.

Manpower programs are being designed to reduce these barriers. We have been learning how to make a full employment economy work. It is now possible to say with confidence that we can provide full employment for all Americans.

Unused Manpower Resources and Their Development

Several new and revolutionary manpower programs authorized by the Congress since 1961 are helping to upgrade workers' skills and prepare disadvantaged people for employment. These programs were made possible by the Area Redevelopment Act of 1961, the Manpower Development and Training Act of 1962 and its subsequent amendments, the Economic Opportunity Act of 1964, and other legislation.

A Variety of Programs Are Needed for Disadvantaged Groups

The new manpower programs had forerunners in the measures undertaken by the Federal Government years ago to aid groups with special handicaps. The program for disabled veterans was one of the earliest of these measures. It paved the way for rehabilitation services for physically and mentally handicapped civilians. Other programs begun long ago give reservation Indians education, training, and other help they need to become self-supporting.

The War on Poverty has extended our national concern for aiding disadvantaged people to all who live in poverty. However, the country's poor people include so many different groups that varied programs have had to be set up in order to help them effectively. Thus there are, for example, several War-on-Poverty programs for youth and also for farmworkers (discussed later in this booklet).

The Work-Experience Program is the part of the War on Poverty chiefly concerned with helping the adult poor. More than 100,000 unemployed persons on public assistance, as well as some other needy people, will get work experience and job training under this program during fiscal year 1966. Since each enrollee has, on the average, three dependents, several hundred thousand people will be helped this year.

A program like this one, which aims to equip welfare recipients for employment, can be an extremely good investment in strictly dollar terms. Nearly 12,000 enrollees in work-experience projects who had previously received public assistance became self-supporting between October 1963 and December 1964, either immediately after participating in one of these projects or after another period of federally-aided training. The public

assistance payments to these workers and their dependents (who numbered close to 60,000 altogether) had amounted to nearly $1.3 million per month.

Job Development and Training Programs Make Steady Progress

Besides programs for particular disadvantaged groups, a Nationwide Job Development Program has been conducted since early 1965 by the direction of the President. The major focus of the program has been on developing on-the-job and other training opportunities in service and related fields, through projects conducted under the Manpower Development and Training Act. By the end of 1965, training for about 112,000 individuals in service and related areas had been authorized.

The basic purpose of MDTA training programs is to equip unemployed workers with marketable skills—and thus help to meet the country's need for trained manpower as well as the workers' need for jobs. Altogether, training will be authorized for about 275,000 such workers in MDTA programs during fiscal 1966, as compared with 215,000 last year. These figures cover all fields of training, including technical, clerical, industrial, service, and agricultural occupations.

The Small Business Administration program of loans and management assistance to small businesses operated by people now below the poverty line is making steady progress. During the first 10 months of operation, loans were made to nearly 900 needy individuals, to help them set up or expand a small business. About 40 percent of those who have received loans are Negroes; a few are Indians living on reservations.

A Human Resources Development Program was also launched by the Department of Labor in late 1965, with the cooperation of the Department of Health, Education, and Welfare and the Office of Economic Opportunity. This community-based program will strive to reach jobless and disadvantaged workers and potential workers in localities with heavy unemployment, to analyze their individual problems and abilities, and to develop training projects and other services which will help them qualify for, obtain, and hold jobs. First begun in three Chicago slum areas in late 1965 as an experiment, this program is now being expanded to five more cities.

These programs add up to a pioneering national effort to help disadvantaged people become productive workers. They are still too small, however, to serve all those needing aid [illegible] preparing for and finding jobs. To meet these people's needs fully will [illegible] and enlarged and coordinated efforts by government at all levels and also by employers, unions, community agencies, and educational and training institutions.

Many improvements are needed also in services to particular disadvantaged groups. To cite a few examples:

- Physically and mentally handicapped people are still greatly underutilized, despite much progress already made in their rehabilitation. An expansion in the Federal-State vocational rehabilitation program has been authorized. It is important that this expansion take place as rapidly as possible, especially in those States now lagging behind the country generally in the extent of rehabilitation services provided for their people.

- Older workers need much more help. They should be among the groups given priority in work and training programs. More experimentation should be undertaken to place older workers in new kinds of jobs—for example, as aides in a Senior Health Corps.

- American Indians, the country's most disadvantaged minority group, also need expanded training, job development, and regional development programs to achieve economic self-sufficiency.

- Expanded training and job adjustment programs for prisoners and parolees are another urgent need. Steps which would be helpful include the establishment of more halfway houses for both young and adult prisoners scheduled for release, increases in counseling and placement staffs available for work with them, and further development of citizens' committees to promote community cooperation in opening job opportunities to former prisoners.

Young Workers

Employment Problems of Young Workers Require Continued National Attention

A record number of young workers aged 16 to 21 entered the labor force last year, but the expanding economy provided an even greater number of jobs. Both the number and proportion of youth who were unemployed actually fell, as pointed out in the Review of Current Developments. Nevertheless, the rate of unemployment for young workers is still almost three times the rate for all workers. Among nonwhite youth, 1 in every 5 is jobless.

More and more young people will be working or seeking work in the years ahead, because the number of 18 year olds in the population will grow by at least 3½ million yearly during the rest of the decade. Many of these young workers will lack the education and training they need to compete successfully for available jobs. Although the proportion of boys and girls graduating from high school will probably continue to rise substantially, the increase in the youth population will mean an increase also in the total number of school dropouts. Furthermore, the number of young workers will grow most rapidly among nonwhites—especially among those whose parents are poorly educated—the groups most likely to drop out of school. (See chart 5.)

This projection of an increase in the number of school dropouts poses a challenge to our education system. In view of the mounting number of young workers and the rise in average levels of education, undereducated youth will be competing for jobs in future years with more and better educated young men and women. The handicap imposed by a poor education today is but a pale indication of what it will be in the future. We need, therefore, to develop more effective measures for motivating young people to stay in school.

Most Young Workers Are Not in School

The majority of young workers aged 16 to 21 have left school behind them; students predominate only among the 16- and 17-year-old workers. While students as well as other young people work primarily because they need money, jobs are most important for those who are out of school. Yet the unemployment rate is higher for out-of-school youth than for student workers (13 percent, compared with 10 percent in October 1964).

Chart 5 **Nonwhite population 18 years old—though smaller than the white—will grow at much faster rate in next decade.**

Source: U.S. Department of Labor, based on data from U.S. Department of Health, Education, and Welfare.

In addition to the unemployed, there are large numbers of young people who are out of school but not in the work force. (See chart 6.) In 1964, 1 out of every 12 young white men and 1 out of every 8 nonwhite men were in this situation. These young people were not seeking jobs for a variety of reasons. Some were ill, awaiting induction into the Armed Forces, or taking job training. But a considerable proportion were out of the work force because they did not think they could find jobs.

Dropouts Have Heavy Handicaps

Almost half the young workers who are out of school do not have a high school diploma. The ratio is even higher among nonwhite youth. More-

Chart 6 **Proportion of young men out of school and not working is especially high among nonwhites.**

Source: U.S. Department of Labor.

over, about a fourth of the dropouts have not even completed the eighth grade.

Those who have not graduated from high school are at a serious disadvantage in the job market. Their unemployment rate is double that of graduates; they have to look much longer to find a job; and they have to take less skilled, lower paid work. Their handicap tends to become more severe with time.

Financial pressures are an important factor in dropping out, but the educational level of the family is even more important. The dropout rate is much lower among poor families where the father had at least a high school education than among families with more adequate income where the

father had less than 8 years of schooling. The fact that education is so closely related to socioeconomic background implies that the generation-to-generation pattern of low educational levels can be broken only by programs aimed at their complex origins.

New Youth Programs Have Helped Mitigate Unemployment

In the past 4 years a number of Federal programs tailored to the varying needs of young people have helped to relieve unemployment among youth and increased their preparation for the job market. These programs include the training provided jobless youth under the Manpower Development and Training Act, the Neighborhood Youth Corps (NYC), the Job Corps, and the Youth Opportunity Centers (YOC) of the Federal-State employment service system.

Almost 50,000 youth—close to half of whom had quit school before high school graduation—were given occupational training under the MDTA during 1965. (See chart 7.) Many received basic education, intensive counseling, placement, and other supportive services in addition to job training and more than half of them received allowances while in training.

The job placement record for young people who have completed training is very good. As of mid-October 1965, the employment rate was about 80 percent for youth aged 16 to 21 who had completed institutional training projects. It was even higher—over 85 percent—for "graduates" of on-the-job training programs, most of whom have stayed on with the same employer who provided the training.

The Neighborhood Youth Corps provides paid work experience for disadvantaged youth from low-income families, so that they can afford to stay in school or college, or return to their schooling if they have dropped out. NYC projects are operated by State and local governments and private nonprofit agencies on contract with the Federal Government. They employ youth aged 16 to 21 in a wide variety of jobs where they will help to meet unmet public needs and will not displace present workers.

For boys and girls who are still in school but who might otherwise drop out, the NYC's in-school program provides part-time work which will give them financial aid and motivation to continue their education. The projects for out-of-school youth stress work experience which will help these youth develop the attitudes and behavior required for regular jobs.

In fiscal 1965, 278,000 jobs were made available under this program. In 1966, the number of jobs provided will rise to 356,000.

The Job Corps, a residential training program for jobless out-of-school youth, is aimed at young people who have little chance of becoming productive citizens without a complete change in environment. By mid-January 1966, the Job Corps had 17,500 enrollees. Plans call for an enrollment of 30,000 by the end of fiscal year 1966, and of 45,000 by the end of fiscal 1967.

Chart 7

MDTA courses are training young workers for a wide range of occupations.

1/ Excludes "other" occupations which account for about 11 percent of total.

Note: Data refer to trainees 16-21 years old enrolled in MDTA institutional courses during period August 1962-August 1965.

Source: U.S. Department of Labor.

Corpsmen in the conservation centers spend about half their time in needed conservation work; they have, for example, built trails, dug ditches, planted seedlings, and fought forest fires. Those in the urban centers receive training for various kinds of jobs—for example, in repair work, office work, selling, cooking, or health-service occupations. In both types of centers, corpsmen spend considerable time in basic education, physical training, health education, and recreation. They also receive intensive counseling.

The youth services of the Federal-State employment services have been greatly strengthened in the past 2 years. A major development has been the Youth Opportunity Centers, a source of services specifically designed for young jobseekers. At the end of 1965, 120 Youth Opportunity Centers

had been established in large metropolitan areas in 50 States. By July 1, 1966, 200 centers are expected to be in operation in 139 areas, where half the country's young people live.

The basic aim of the centers is to increase the employability of young people by counseling, testing, and job referral. When needed, the young applicant may be referred to vocational training, to work-training programs, or to other services. The centers make great efforts to reach disadvantaged young people by seeking them out in their neighborhoods and through their schools. From February through October 1965, 300,000 new job applicants were served by the centers and 73,000 were placed in jobs.

Education and Training Offer Long-Run Solution

The new youth programs aim to help disadvantaged young people overcome handicaps they acquired early in life, because they grew up in slums or poor rural communities and did not have adequate schooling. These are remedial programs, aimed at easing the potentially explosive problem of jobless youth. But stopgaps of this kind are not enough. We must seek also to prevent more children from growing up undereducated and underprivileged, and thus break the cycle of poverty now passed on, all too often, from one generation to the next.

TABLE I. MAJOR PROGRAMS SERVING DISADVANTAGED YOUTH, FISCAL YEARS 1965–67

[Enrollments or jobs]

Program	Out-of-school programs	In-school programs	Summer programs[1]
1965			
Total	126,741	117,000	114,000
Neighborhood Youth Corps	62,000	102,000	114,000
Job Corps	10,241	----------	----------
MDTA training	54,500	----------	----------
Vocational education work-study program	----------	15,000	----------
1966[2]			
Total	159,000	185,000	196,000
Neighborhood Youth Corps	60,000	100,000	[3] 196,000
Job Corps	30,000	----------	----------
MDTA training	69,000	----------	----------
Vocational education work-study program	----------	85,000	----------
1967[2]			
Total	172,000	160,000	165,000
Neighborhood Youth Corps	64,000	125,000	165,000
Job Corps	45,000	----------	----------
MDTA training	63,000	----------	----------
Vocational education work-study program	----------	35,000	----------

[1] Many summer program enrollees are also served by the in-school program.
[2] Estimated.
[3] Includes 31,000 jobs provided during the summer of 1965.

The best hope of progress toward a long-run solution of the interrelated problems of poverty, lack of education, and inability to qualify for current jobs lies in strengthening of education at all levels from preschool onward. In recognition of this fact, the Congress has enacted two dozen educational measures in the past 4 years. Only a few of the most important of these measures can be mentioned here.

The Elementary and Secondary Education Act of 1965 is landmark legislation in the promotion of educational opportunity. Among other purposes, it seeks to strengthen elementary and secondary school programs for educationally deprived children in low-income areas and makes funds available for services such as counseling, remedial instruction, and preschool training for disadvantaged children.

Passage of the Higher Education Act of 1965 also opened up a number of new pathways to educational opportunity. Funds were made available to help colleges and universities provide community services, to improve libraries, to strengthen young or weak colleges, to give financial assistance to students, to strengthen teaching and improve undergraduate instruction, and to aid construction of needed facilities.

A major overhaul of the country's vocational education system, to bring the training more into line with current needs, was made possible by the Vocational Education Act of 1963. The new area vocational-technical schools now being constructed with funds authorized by the act are one of the innovations which will be particularly helpful to underprivileged youth. Each of these schools will provide a broad vocational education program for a group of communities which could not by themselves have afforded such a program for their young people and adults in need of training. About 125 area schools in 41 States were authorized in fiscal year 1965. This number will have to be multiplied many times to meet the total need.

A number of States are also setting up or expanding vocational education programs tailored to the needs of special groups—for example, immigrants or young people from minority groups in slum areas of large cities and disadvantaged youth in isolated rural, mountain, or border areas.

Project Head Start, a major experiment in preparing young children for school, and thus preventing educational failure, was launched in the summer of 1965 as part of the War on Poverty. Under Project Head Start, more than half a million preschool children in every State attended classes for 6 to 8 weeks last summer. At least 85 percent of the children in the projects came from poor families. Small teaching groups, remedial medical care, and other related services were features of the program; substantial improvements were noted in the children's originally low performance levels. In 1966, the summer program will be repeated for another 500,000 children. In addition, about 100,000 children were enrolled in full-time Head Start projects during the 1965-66 school year.

The national goal in education must be to give all the American people—children, youth, and adults at all levels of ability and from all kinds of backgrounds—the opportunity to develop their abilities fully. Because of the great lag in the education of the underprivileged, special efforts are called for to speedily improve educational opportunities for the poor, especially nonwhites. In particular, the provisions for Federal aid to poor school districts under the Elementary and Secondary Education Act should be put into effect as rapidly and fully as possible.

Still greater opportunities for both preschool and post-high school education are much needed. Specifically:

- Project Head Start should be continued and broadened. Local school systems should also move ahead in establishing and strengthening nursery school and kindergarten programs.

- Free public education for 2 years past high school should be more widely available. This would prepare more young people for rapidly expanding technical occupations and, in so doing, would help to meet the economy's demand for trained workers. Full advantage should be taken of Federal financial aid to extend and improve the network of community colleges and other public post-high school institutions.

The new training, work-training, and other remedial programs for jobless youth need to be strengthened. These new youth programs have helped great numbers of young people (as shown in table 1). They still reach only a fraction of the total number needing their services, however. Roughly 3 million young people are estimated to be in need of special youth programs, more than five times the total number that will be served by all these programs during 1966. This 3 million includes 1.8 million out-of-school youth and 1.2 million who are still students.

Another need is more effective coordination of the new programs and strengthening of the counseling, health, and other supportive services provided. The programs should also be extended to small towns and rural areas, where special youth services are now almost entirely lacking.

Farmworkers

Simultaneous Abundance and Poverty Characterize American Agriculture

American agriculture has been the source of some of the Nation's greatest economic and social achievements. The country's farms not only supply most of the food and fiber needed by our rapidly expanding population but help to feed people in other countries as well.

Nevertheless, farm people face severe problems of underemployment and poverty. Though the average per capita income of farm residents has been rising, it is still less than two-thirds that of the nonfarm population. Farmers have a lower average income than any other occupational group except farm laborers (chart 8). The very abundance of farm production has tended to lower farm prices and incomes, requiring Government action to stabilize prices and production of some crops.

The working conditions of hired farmworkers are also much inferior to those of nonfarm workers. Farmworkers are usually excluded from the social insurance and labor standards legislation which help to protect the nonagricultural work force. Many farmworkers, able to get only temporary seasonal jobs, migrate from area to area in an effort to piece together enough work to earn a living. But even so, they are likely to have frequent periods of unemployment.

Farm Employment Is Declining

Farm manpower requirements have been declining for many years, even as farm output has risen. Annual average employment on farms—including farm operators, unpaid family workers, and hired workers—fell from 10 million in 1945 to 5.6 million in 1965, or by about 45 percent. (See chart 9.) The number of farm operators and unpaid family workers dropped by nearly 50 percent—from 7.9 million in 1945 to 4.1 million last year. Average employment of hired workers decreased more slowly—from 2.1 million to less than 1.5 million, or by 30 percent. But hired workers now have fewer days of work per year, on the average, than they did years ago. Most of them are seasonal workers; only about 300,000 have regular year-round jobs.

Chart 8

Farmers and farm laborers have lower average incomes than any other occupational group.

1/ Excludes workers in private households.

Note: Data refer to median income from employment, including self-employment, of men in civilian labor force in 1964.

Source: U.S. Department of Labor, based on data from U.S. Department of Commerce.

Chart 9 **Farm employment has shown steady decline, especially for family workers.**

Source: U.S. Department of Labor, based on data from U.S. Department of Agriculture.

The main cause of the decline in farm employment has been new technology, particularly mechanization. The number of tractors and motor trucks on farms has doubled since World War II. Ingenious new machines to cultivate and harvest corps, such as the cotton harvester, have come into general use. Manpower requirements per unit of output have been further reduced by the use of modern fertilizers and of chemicals to kill weeds and pests, and by the development of new varieties of plants.

There has also been a trend toward combining farms into fewer and larger units, better able to afford the new, expensive machinery. This has been one of the chief reasons for the sharp decrease in farm operators during the past two decades.

Since continuing advances in farm technology are expected, farm manpower requirements will go on declining. According to projections by the Department of Agriculture, man-hours of farm labor in 1980 will be at least a third lower than in 1964. (See chart 10.)

This means that a continuing stream of farm people will have to move to nonfarm jobs and localities in search of a livelihood. There is therefore great need to give rural youth, the group most likely to move, better education and training for nonfarm occupations. Unless this is done, the movement of farmworkers into cities will have the same effect as it has often had in the past. It will intensify unemployment and other problems in slum areas overcrowded with uneducated, ill-prepared people attempting to adjust to city life and work.

Chart 10 **Farm manpower needs will continue to decline as productivity gains exceed rise in output.**

Source: U.S. Department of Labor, based on data from U.S. Department of Agriculture.

Employment of Foreign Workers on U.S. Farms Sharply Reduced

Job opportunities for domestic farmworkers were improved dramatically in 1965 by curtailing the employment of foreign workers on U.S. farms.

Workers from outside the United States—primarily from Mexico, Canada, and the West Indies—have been recruited in past years to meet labor shortages during the harvest and other peak seasons. However, use of these workers restricted job opportunities for domestic farmhands and reduced pressures on farmers to improve wages and working conditions in order to attract more American workers. For these reasons, Public Law 78 of the 82nd Congress, under which Mexican workers were brought into this country for temporary farm jobs on a contract basis, was permitted to expire at the end of 1964. Foreign farmworkers can still be admitted under the Immigration and Nationality Act. But regulations issued by the Secretary of Labor in December 1964 insure that foreigners will not be admitted when unemployed Americans are available for farm jobs, and that the wages paid will be high enough so as not to have an adverse effect on domestic wage levels.

Altogether, less than 36,000 foreign farmhands were admitted to the United States in 1965, as compared with 200,000 the previous year. Mexican "braceros," who worked in 17 States in 1964, were employed only in California last year.

Most employers who had formerly used foreign workers were able to adjust to the use of domestic manpower without undue difficulty, though there were some transitional problems. The Department of Labor and cooperating State Employment Service agencies intensified their efforts to help recruit an adequate domestic farm labor force. Several new programs aimed at increasing the employment of students in summer farm jobs were set up. Greater efforts were made also to recruit American Indians for farmwork and to expand the recruitment of Puerto Ricans.

As many as 100,000 U.S. workers took farm jobs in 1965 that were formerly held by foreign farmhands. And farm wage rates rose sharply in areas formerly using foreign workers. In the country as a whole, the average wage rate for farmworkers rose from $1.08 to $1.14 between 1964 and 1965—the largest year-to-year increase since the early 1950's. Even so, the gain was less than the gain in hourly earnings of nonfarm workers during the same period.

New Educational, Training, and Other Programs Aid Farm People

Real progress in improving educational and training opportunities in rural areas is being made under legislation enacted during the past 4 years.

This is very important because rural schools have, as a rule, been greatly inferior to urban ones.

The Elementary and Secondary Education Act of 1965 offers the chief hope of improving elementary and secondary schools for rural youth. The financial aid it provides for poor school districts and its other provisions for enriching educational services can do much to strengthen schools in rural areas as well as urban slums.

Much broader vocational training for rural youth has been made possible by the Vocational Education Act of 1963. The new area vocational-technical schools will be of particular help to rural people. They will give both youth and adults opportunities for training in a broad range of nonfarm occupations as well as vocational agriculture.

The training programs for unemployed workers conducted under the Manpower Development and Training Act are also aiding farmworkers to keep abreast of the changing skill demands of modern agriculture and providing retraining for those who need to prepare for nonfarm occupations. By the end of 1965, training had been authorized for an estimated 100,000 rural workers—about one-fourth of the total number of trainees authorized in MDTA programs.

Special recognition is given in the MDTA to the needs of small farm operators who have low incomes. Members of farm families with less than $1,200 annual income are considered unemployed under the act and are therefore eligible for training allowances (provided they meet other requirements applied to all unemployed workers).

Opening more employment opportunities in impoverished rural communities and other depressed areas has been the goal of another series of programs. The Area Redevelopment Act of 1961 (ARA) provided financial aid to "redevelopment areas" with high unemployment, to help them build up their sewer and water systems, transportation, and other physical facilities. Loans were also made under the ARA to aid new or expanding industries. The employment and income these new industries provided in rural areas were expected to cut down the rate of out-migration and help farm families escape from poverty.

A similar but much broader redevelopment program is now being conducted under the Public Works and Economic Development Act of 1965, which superseded the ARA. In addition, the Rural Areas Development program of the Department of Agriculture is helping to relieve rural manpower problems by stimulating new job opportunities and helping communities in other ways. The achievements under this program show that when rural people are given technical and financial assistance, they can do a great deal to solve their communities' economic and social problems.

The poverty of farmers and farmworkers is also being attacked through several War-on-Poverty programs. The Neighborhood Youth Corps, for example, has made particular efforts to include rural youth in its work-training programs for disadvantaged youth. During 1965, a fourth of all NYC enrollees were in rural projects.

Special War-on-Poverty projects provide better housing, sanitation, education, and child-care programs for migrants and other seasonal farmworkers. These projects are operated both in the home areas from which migrant farmworkers come and in the places where they do seasonal farmwork. By the end of 1965, an estimated 157,000 workers and their dependents had been served in 27 States.

Community Action Projects have served the poor in 650 rural counties. They give farmworkers and other rural people help in obtaining employment and training, health and vocational rehabilitation, remedial education, counseling, and other services.

Another War-on-Poverty program provides loans to poor rural families and rural cooperatives. These loans help farmers and other small businessmen now below the poverty line to improve their operations. Rural people have been helped also by the basic education program for adult illiterates and by the Work-Experience Program for public assistance recipients. This latter program can be of special help to the many seasonal farmworkers who are supported by public assistance part of the year.

Conclusions and Recommendations

Though much progress in helping rural people has been made under recent programs, a great deal remains to be done.

- Further improvement of educational and training opportunities in rural areas is a first essential, to give farm people the preparation they need to compete in the present-day economic world.

- More progress must be made in the economic development of rural areas. Additional nonfarm job opportunities in such areas would help to offset the continuing decline in farm employment and reduce the pressure on farm people to move to cities in search of work.

- Steadier employment of hired farmworkers is another pressing need. The Department of Labor's Annual Worker Plan, under which efforts are made to arrange successive jobs for migratory workers, should be greatly expanded. But new ways of stimulating and assisting the systematic transfer of workers among seasonal jobs also need to be worked out. And new efforts are needed to develop more nonfarm work in rural areas in the seasons of the year when there is little demand for farm labor.

- The dramatic success in cutting back employment of foreign workers on U.S. farms in 1965 should be followed up in 1966 and hereafter. Use of foreign workers should be limited to severe labor-shortage situations, where employers who offer adequate wages and working conditions and conduct intensive recruitment activities are nevertheless unable to attract enough domestic workers. The experience gained in domestic-worker recruitment programs in 1965 should also be utilized to improve recruitment efforts in coming seasons.

- Unemployment insurance should be extended to farm wage workers, beginning with those on large farms.

- Protection of farmworkers under State workmen's compensation laws should receive active consideration.

- Careful consideration should be given to the need for amending the Fair Labor Standards Act to provide minimum-wage protection for farmworkers and to prohibit the hiring of young children in agriculture outside of school hours.

- Consideration should also be given to legislation for protecting the rights of farmworkers to form and join unions and to bargain collectively with their employers.

- The public employment services available in rural areas should be greatly increased. The aim should be to give farmworkers who need to migrate information on job opportunities, housing, and other conditions in the places to which they may move, and also to help them make advance job arrangements.

*PROGRAM GUIDES; *VOCATIONAL AGRICULTURE; *COOPERATIVE EDUCATION; *OFF FARM AGRICULTURAL OCCUPATIONS; *AGRICULTURAL ENGINEERING; PROGRAM DEVELOPMENT

The organization and operation of a cooperative education program in agriculture mechanics as an integral part of a vocational agriculture program are explained. The advantages of a cooperative education program to the student, school, cooperating employer and the community are cited and responsibilities of the school for organizing the program are detailed. An example is provided of policies regarding students, related instruction, training plans, and training center supervision. Legal activities which affect the program in Indiana are summarized and procedures are outlined for meeting the legal requirements. The purposes, advantages functions, qualification, size, organization, appointment, and operation of a consultant committee are outlined. Other major sections of the handbook presents information relating to trainee selection, training center selection, training plans, training agreements, trainee placement, related instruction, program coordination, program evaluation, trainee evaluation, records, reports, course of study, teaching aids, awards, Indiana child labor laws, U.S. Fair Labor Standards Act, and student followup. Included are examples of forms used in enrollment application, surveys, training agreements, visitations, student evaluation, awards, and followup. (JM)

Glossary

Section I

Description of The Agricultural Mechanics Occupations Program

The primary purpose of the program is to enable the young men to gain those competencies that are needed in the field of agricultural mechanics. The program is designed as a cooperative educational program between the secondary schools and local agricultural businesses.

Students should be able to receive instruction in specific areas of agriculture machinery occupations, that would enable them to become proficient as a set-up man; mechanics helper; mechanic; service department manager or a parts man, at the same time meeting the requirements for a high school diploma.

The student is to spend part of the day in the cooperating center under the direction of a supervisor selected from the firm or business in which the student is working. The remainder of the time is to be spent in the local school.

The agricultural mechanics course is not to be a separate entity but is to be an integral part of the total vocational agriculture program with the vocational agriculture teacher providing the related instruction and coordinating the program.

Section II

Advantages of The Agricultural Mechanics Occupations Program

To the student:

1. Develops the highest degree of competency possible in the understandings of basic functions of machines and machine parts.
2. Prepares the student for job-entry and advancement in agricultural mechanics while still attending school.
3. Provides supervised training on the job under actual job conditions.
4. Provides the student an opportunity to select a possible occupation for his future.
5. Gives encouragement to student to stay in school.
6. Develops work habits, attitudes and responsibilities.
7. Provides students with opportunity to cooperate with others.
8. Provides students with opportunity to see the need for further education.
9. Gives student opportunity to establish a desirable reputation on-the-job.
10. Establishes a self-sufficient attitude in student.

To the school:

1. Provides opportunity to meet more fully the educational needs of the community.
2. Provides a more complete program for the non-academic curriculum.
3. Increases community interest in school activities.
4. Promotes good public relations between school and community.
5. Broaden the total program of vocational agriculture in the school.
6. Improve attitudes of students towards school.

To the cooperator:

1. Opportunity to train employees while they are still in school.
2. Opportunity to develop a vocational program with the local schools.
3. Develop a strong community profile for the business.
4. Provide incentive for young men in the community.
5. Reduce training problems and expenses.
6. Increases efficiency of regular employees.
7. Receive more direct benefits from local school.

To the community:

1. Improve local economy.
2. Improve work habits and citizenship.
3. Increases available labor force.
4. Promotes closer cooperation between school and community.
5. Increase the desire of individuals to live in the community.

Section III

Procedure for Organizing An Agriculture Mechanics Occupations Program

RESPONSIBILITIES OF THE SCHOOL

"Agricultural Mechanics Program"

The following are suggested as responsibilities of the local school in developing an agricultural mechanics program.

1. The vocational agriculture instructor, school administrators, guidance personnel, superintendent, and the school board should discuss the program and agree that one or more of the following steps of the organizational procedure should be carried out.

2. A local survey should be made to determine the number and kinds of agricultural mechanics, businesses, or firms in the surrounding area.

3. The vocational agriculture instructor and the guidance personnel should make a preliminary survey of the high school student body to determine the number of prospective students.

4. The Vocational Agriculture Division of the State Board for Vocational Education should be contacted for any assistance they may be able to offer.

A member of the State Staff will meet with the local school officials to explain the state's reimbursement policies and standards and provide any other available services which the local school may desire.

5. The legal aspects of the Agricultural Mechanics program should be explored. (See legal activities sec.)

6. A consultant committee should be appointed.

7. The public relations program should be planned and implemented.

8. The school should develop and adopt a policy statement which will serve as an operational guide for the Administration of the program.

9. Arrangements for providing necessry school facilities and equipment should be made.

10. Trainees should be selected based upon the minimum qualifications specified by the school.

11. Training Centers should be selected.

12. The training plan should be developed.

13. The required forms and certificates should be completed.

14. The necessary reference and instructional materials should be purchased or secured.

15. Arrangements should be made with the school administration concerning class schedules, travel allowance, etc. so that an adequate job of coordination, evaluation, and follow-up can be accomplished.

16. Trainees should be placed in training centers.

17. The program should be evaluated.

SURVEY OF THE COMMUNITY

One of the first steps in initiating an agricultural mechanics occupations program is a survey of the community. The purpose of this preliminary survey is to determine the employment opportunity in agricultural businesses within the community. This survey will also identify possible training centers.

Most vocational agriculture instructors are familiar with the community in which they are located so they can list most of the agricultural businesses, However, in most communities it would be impossible to list all the agricultural businesses or firms without assistance. There are numerous ways to get assistance in locating all these businesses for firms. Most of them will be listed in the yellow pages of the telephone book. Other sources such as the consultant committee, local Chamber of Commerce, local labor office, civic clubs, and other professional organizations will also be a valuable help in making the list complete.

Section IV

An Example of Policies For
The Agricultural Mechanics
Occupations Program

Students

1. Age
The trainee must be 16 years of age or older to meet the requirements of labor laws. Trainees who will be 16 during the first 6 weeks after the beginning of school may be enrolled. They cannot, however, be employed under a student-learner certificate until they are 16 years of age.

2. Hours of Training
Trainees employed in occupations governed by the U.S. Fair Labor Standards Act may spend as many hours at the training center as approved, provided these hours, plus the hours spent in regular classes in school do not exceed 40 hours per week. Sufficient time in training on the job is needed for instruction, observation time in training on the job is needed for instruction, observation, and practice to learn the various phases of the job. Normally, the trainees will spend five hours per day in school and two or three hours per day at the training center. When school is not in session on any school day, the trainee may work more hours than the student-learner's certificate authorizes, provided, however, the total hours shall not exceed 8 hours per day. During the school term when school is not in session the entire week, the trainee may work additional hours, not to exceed 40 hours.

Trainees employed in occupations which do not fall under the jurisdiction of the U.S. Fair Labor Standards Act will be governed by the Indiana Child Labor Laws - See the appendix for a summary of the Indiana and U.S. Labor Laws.

3. Selection
Trainees should be selected who are interested in preparing for training in occupations which require knowledge and skills in agriculture. Trainees must be employable, therefore it is essential that selection be based on a carefully designed procedure which takes into consideration such things as aptitude, interest, personality, work habits, etc.

4. Wages
Trainees must be paid for the time spent on the job at the training center. The local consultant committee should recommend a standard beginning wage for trainees. Increases in wages will be determined by the trainees performance. See the appendix for more information concerning Student-Learners Certificates and minimum wage laws.

5. Length of Training Period
Trainees must be employed in a training center for at least six months and a minimum of 250 hours during any one year. Trainees should be employed no later than six weeks after the opening of school.

6. Travel
The trainee must be responsible for his own travel to and from the training center. Any approved training center should be within a reasonable distance from the school and the home of the trainee in order to reduce travel.

7. Individual Training Plan
An individual training plan must be developed for each trainee. Both a course of-study for his classroom related instruction and a training outline for his occupational on the job training at the training center is necessary.

8. F.F.A.
Trainees enrolled in the agricultural mechanics occupations program should receive additional experience through membership in the Future Farmers of America.

RELATED CLASS ROOM INSTRUCTION IN AGRICULTURAL OCCUPATIONS

1. Length of time
A minimum of one hour (55 minutes in the clear) per day for related classroo instruction is required.

2. Course of Study
Instruction applicable to all agricultural and occupations will be provided Such instruction will include such areas as:

(1) Applying for a job
(2) Human Relations
(3) Labor Laws
(4) Workmen's compensation laws
(5) Social Security
(6) Other

b. Instruction will also be provided which is applicable to the individual trainees occupation. This instruction will be primarily individual study under the teacher-coordinator.

3. Size of Classes
The maximum enrollment for one full-time teacher-coordinator shall not exceed 25 students.

4. Facilities and Instructional Material
a. The school must provide satisfactory classroom facilities for this prog In most cases, the vocational agriculture department will be adaptable to provide the necessary facilities.
b. The school must provide sufficient instructional materials for the stud

TRAINING PLAN

1. The Training Plan should be developed cooperatively by the person directly responsible for training the student (supervisor) and the teacher-coordinat

2. The Training Plan should contain the basic knowledge, manipulative skills, abilities that the trainee should learn on the job, in the classroom, and i the laboratory.

SUPERVISION OF TRAINEES AT THE TRAINING CENTER

1. By the Supervisor
   The cooperator, or a person designated by the cooperator, will be responsible for training the student at his place of business. He should assist in developing the training plan in order that no step, job, operation or procedure is omitted. He is to provide instruction at the center which will prepare the trainee for entry into that occupation.

2. By the Teacher-Coordinator
   The primary role of the teacher-coordinator will be to work closely with the cooperator and/or the supervisor. He will make periodic visits to the training center to check with the business personnel and observe the student in training. The local school district should provide ample time and travel allowances for the coordination of the program.

Section V

SUMMARY OF LEGAL ACTIVITIES AFFECTING ENROLLMENT IN RELATED OCCUPATIONS OF AGRICULTURE MECHANICS

Procedural Steps to be Followed:

1. File form No. 35-0, Application to organize and conduct a program. File form No. 30-0 for state approval before program is instituted.

2. File form No. A-1 (Intent to Employ) before student starts to work.

3. Students must show proof of age (Birth Certificate)

4. Students must apply for social security card.

5. Request for Inspection report must be filed with the Division of Labor.

6. File form V-80-0 by December 1.

Legal Guides To Agriculture Mechanics Program

A. Agricultural Mechanics programs should be restricted to students sixteen years of age or older.

B. Requirements regarding employment and age certificates
   1. Every employer must secure an employment certificate before he permits any boy or girl under 18 years of age, including high school graduates and married youth, to work for him at any time. This certificate must be kept on file as long as the youth is employed.

   2. At the termination of employment, the employer must mail the termination notice to the issuing office.

   3. Kinds of certificates are issued:

      a. General employmnnt certificates are required for youth 16 and 17 years of age.

b. Age certificates are issued upon request for minors 18 to 21 years of age. This certificate should be kept on file while the minor is employed and returned to the minor at termination of employment.

4. An employment certificates is not transferable from one job to another. An age certificate is transferable from one job to another or one employer to another.

5. An employment certificate is needed in addition to a social security card.

C. Where to obtain certificates.

1. Employment and age certificates may be obtained at the office of the City or County Superintendent of Schools.

D. How to obtain certificates.

1. The employer fills out completely and signs the Intention to Employ Form A-1. (No Intention to Employ is required for an age certificate.) Intention to Employ forms may be obtained from the office of the City or County Superintendent of Schools.

2. The youth presents the completed Intention to Employ form, together with a birth certificate, to the employment certification office.

3. As soon as all requirements are met the issuing officer mails the employment or age certificate to the employer. If for some reason the certificate cannot be issued, the employer is notified.

E. Posting requirement.

1. When boys under 16 or girls under 18 are employed, the employer must post and keep posted in a conspicuous place where minors are employed, a printed notice stating the maximum number of hours such minors are permitted to work.

F. Maximum hours of work for youth.

1. Boys 14 and 15 and girls 14 through 17 may not work more than:
   a. 8 hours a day.
   b. 48 hours a week when school is not in session (40 hours for boys and girls in interstate commerce).
   c. Six days a week.
2. During school term boys and girls in interstate commerce may not work more than:
   a. 3 hours on school days, 8 hours on Saturday.
   b. 18 hours a week.
   c. 6 days a week.

3. Night work:
   a. Boys and girls 14 and 15 may not work before 6 a.m. nor after 7 p.m.
   b. Girls 16 and 17 may not work before 6 a.m. nor after 9 p.m.
   c. Boys 16 and 17 may not work before 6 a.m. nor after 10 p.m. as a public messenger.

G. Legal minimum ages for employment.

16 years of age--during school hours and in manufacturing and in certain others jobs at any time.

18 years of age--in a number of hazardous occupations.

COOPERATIVE VOCATIONAL PROGRAMS --STANDARDS.--Sec. 4a. Any public school corporation may through its appropriate officials enter into cooperative programs with employers of labor wherein said employers agree to provide employment for students, enrolled in school-directed vocational education programs, to learn the manipulative skills or manual processes of an occupation and such employers are hereby authorized to employ such students in otherwise restricted occupations for the purpose of vocational education training under the following conditions:

(1) That training in the occupation is approved by an authorized school authority and is school supervised.

(2) That the training station of the occupation is jointly approved as to conditions of work, including safety factors, by the safety inspectors of the Indiana Division of Labor and the proper school authorities.

(3) That the student in training is assigned to competent adults delegated by the employer for instruction and supervision in the manual processes or manipulative skills of the occupation according to a written training schedule jointly developed by the employer and a representative of the school. (Acts of 1957, Chap. 269, Sec. 1, Burns 28-4904a.

Section VI

THE AGRICULTURAL MECHANICS OCCUPATIONS CONSULTANT COMMITTEE

A local consultant committee can be of valuable assistance in the development and operation of an Agricultural Mechanics Occupations Program. The committee provides a link between the school and community. The function of the consultant committee is to advise and counsel the school in improving the vocational program.

In every community the needs and objectives of the program will vary. It is the purpose of the consultant committee to assist in guiding the program so that it will meet the needs of the local community.

PURPOSES OF THE CONSULTANT COMMITTEE OF AGRICULTURAL MECHANICS PROGRAM.

1. To secure ideas and advice of representative key people in agricultural mechanics businesses in the area.
2. To study community situations and determine community needs of agriculture mechanics businesses.

3. To clarify the relationship of the vocational agriculture department and agricultural mechanics program with the community.

4. To explain the program to the public and aid in promoting public relations.
5. To assist the teacher by giving him encouragement and support, and aid in relating the instruction in agricultural mechanics to the particular needs of the community.

6. To help evaluate the agricultural mechanics program phase of the vocational agriculture department.

ADVANTAGES OF THE CONSULTANT COMMITTEE

1. Promotes the school, community and vocational program in agricultural mechanics.

2. Brings about a closer relationship between the school and the community.

3. Provides an opportunity to study the real training needs of the agricultural mechanics businesses.

4. Provides a sounding board for new ideas.

FUNCTIONS OF THE CONSULTANT COMMITTEE

1. Assist in the selection of training centers.

2. Render service in identifying employment opportunities.

3. Assist in setting standards for trainee selection.

4. Advise on the development of instructional material.

5. Provide guidance in establishing wages and hours of training.

6. Help publicize and promote the program.

7. Advise on the selection of references and other instructional aids.

8. Assist in setting local training standards.

9. Assist in conducting the community survey.

10. Assist in the selection of subjects, course content, and special emphasis that should be included in the training plan.

11. Assist in evaluating the program.

QUALIFICATIONS OF COMMITTEE MEMBERS

1. Members should express an interest in the problems of the school system.

2. They should indicate a specific interest in agricultural mechanics programs.

3. They are willing to devote the necessary time to committee work.

4. They should not be persons who will exploit the committee for their own personal benefit.

SIZE OF THE COMMITTEE

The size of the agricultural mechanics program and the geographic area served are factors that tend to affect the number of members of the consultant committee. The committee should be large enough to be representative of the community but small enough to permit active participation in the discussion of problems and the formulation of recommendations. It is recommended that representatives of the Implement Dealers, local school officals and a member of the over-all vocational agriculture committee should be members of this committee.

ORGANIZATION

1. The local board of education should authorize the superintendent of the school, the principal and the teacher-coordinator to organize the consultant committee.

2. The superintendent and principal should be ex-officio members of the committee.

3. The committee should select a chairman and a secretary from its membership. They are responsible for the work of the committee.

4. The teacher-coordinator should participate in all meetings.

5. A constitution and by-laws should be adopted by the committee.

HOW TO APPOINT

1. The superintendent, principal and teacher-coordinator should compile a list of persons to be considered for appointment.

2. Go over the list of prospects and make the selection of committee members.

3. The superintendent can then send out a letter of appointment and explain the purposes of the committee. He also can give the time and place of the first meeting.

4. Shortly after the letters have been received, it would be advisable to visit and briefly explain the purposes of the committee, and at the same time remind the members of the first meeting date. Many times it may be advisable to contact prospective members and determine if they are willing to serve before presenting their names to the school board for approval.

TERM OF APPOINTMENT

1. It is best to stagger the replacements so that there are always experienced members on the committee.

WORKING WITH THE CONSULTANT COMMITTEES

In working with consultant committees, you will find it practical to keep certain guiding principles and methods in mind.

1. The members serve on a voluntary basis; therefore, they should not be expected to carry out long, detailed work assignments.

2. School officials should acquaint committee members with the total vocational offerings of the school.

3. Informational material should be put into the hands of committee members. This material should include pertinent releases and publications of the local Board of Education, State Board for Vocational Education, and the U.S. Office of Education.

4. Meetings should be scheduled regulary. Policies should be established whereby special meetings may be called.

5. If possible, committee meetings should be conducted in the same building in which the training program is held.

6. All members should be advised on existing and pending vocational legislation.

7. Copies of minutes of meetings should be sent to all committee members. School officials should have a complete file of minutes of committee meetings.

8. An agenda should be prepared and distributed prior to each meeting.

EXAMPLE OF AN AGENDA OF THE FIRST MEETING OF THE CONSULTANT COMMITTEE

1. Introduction of all members.

2. Explanation of Agricultural Mechanics Program and the need for a consultant committee.

3. Functions of the consultant committee.

4. Responsibility of the consultant committee

5. Term of appointment

6. Election of a permanent chairman

7. Election of a secretary

8. Selection of time and place of meetings

91 Business

ITEMS ON THE AGENDA SHOULD MEET MOST, IF NOT ALL, OF THE FOLLOWING TEST:

1. Is this a real problem?

2. Is this a problem which the school earnestly desires to solve?

3. Will the school use the committees recommendations?

4. Is this a question in which the committee is interested or in which it can become interested?

5. Is the committee competent to discuss and make recommendations on this type of problem?

6. Do members have sufficient knowledge of facts and background information to make worthwhile suggestions.

PITFALLS TO AVOID IN WORKING WITH CONSULTANT COMMITTEES

The skill with which the organization and work of the consultant committee is managed by local school authorities will, in a large measure, determine the benefits that may be derived from their use. In this connection, it may be well to keep in mind possible pitfalls that may be encountered.

School Authorites Should not:

1. Permit the committee to become administrative in its function.

2. Conceal facts pertaining to the program.

3. Enter into labor-management controversies.

4. Fail to keep a copy of minutes of each meeting on file.

5. Take action within the realm of the committees advisory function without first consulting with the committee.

6. Fail to recognize the value of the consultant committee through news releases and other means.

SECTION VII

SELECTION OF TRAINEES

Much of the success of an agricultural occupations program depends upon the calibre of the students enrolled. Students of high calibre do not necessarily mean those in the upper quartile, but refer to those students who possess the aptitude and qualifications required for success in a given occupation. The training in many occupations requires students with desirable personal traits and above average aptitudes. The objectives of a program of this type can only be attained when the trainee enrolled is capable and desirous of receiving training.

The following steps are suggested as a guide to follow in selecting trainees:

1. Make a general announcement concerning the program to all eligible students at least two months before the pre-registration for the next school year.

2. Have all interested students fill out an "Application for Enrollment" form. See examples at the end of this section.

3. Make arrangements with the school counselor to obtain various test scores and other confidential information which will not be reported on the application form. Record this information plus the information taken from the "Application for Enrollment" form on the "Student Information Sheet." See examples at the end of this section.

4. Review the "Student Information Sheets" to determine those students who meet the minimum qualifications.

5. Before a final selection is made, each student should be interviewed personally. This will help obtain information that has not been listed on the student information sheet.

6. After completing the preceding steps, sufficient information should be available to make the final selection of trainees. The following criteria should be kept in mind when selecting trainees:

    a. Select students who have a definite occupational objective.

    b. Select students whose parents approve of their participation in the program.

    c. Select students who possess the ability and willingness to work.

d. Select students who will be at least 16 years of age when on-the-job training period begins.

e. Select students who will work to their fullest capabilities.

f. Select students who will maintain a good school attendance record.

g. Select students who will be able to work the minimum required hours per week.

h. Select students who will be able to get to and from their training stations.

i. Select students who are interested in occupations in which adequate training stations are available.

j. Select students who possess the physical ability to complete training and find gainful employment.

k. Select students who possess high moral character.

l. Select students who possess a basic knowledge and interest in agriculture.

SELECTION OF TRAINING CENTERS IN AGRICULTURE MECHANICS

The selection of adequate training stations is an important key to successful training. The following steps are listed as a quide in the selection of training centers.

1. Compile a list of all possible training centers.

2. Arrange for a personal interview in the firms which might serve as training centers.

3. Complete the information required on the form entitled "Occupational Survey of Job Opportunities and Training Possibilities". See example at the end of this section.

4. From the information obtained on the survey form and with the assistance of the consultant committee, use the following criteria in selecting training centers.

   a. The training center must be an approved agricultural business.

   b. The training center must offer opportunities for advancement within the establishment or should aid in developing the trainees potential ability to the point he would be occupationallly competent to make progress in other similar establishments.

   c. The job should require training -- not just routine work experience of a repetitive nature.

   d. The training center should provide a wide variety of experiences in the occupation.

   e. The training center should provide the trainee with adequate supervision.

   f. The working conditions should be satisfactory.

   g. The training center should have a good reputation and be accepted by the community as a reliable, respected business establishment.

   h. The morale climate of the training center should be high.

   i. The cooperator should have an interest in training the student.

   j. The personnel should understand and appreciate the importance of the training program.

   k. The training center personnel should be capable and willing to provide an adequate number of training hours.

   l. The training center should have adequate facilities, equipment and use up-to-date methods.

m. No regular employee should be laid off in order to train students.

n. The training center should be within a reasonable distance from school.

o. The training center should do a reasonable volume of business.

OCCUPATIONAL SURVEY OF JOB OPPORTUNITIES
AND TRAINING POSSIBILITIES

Interviewer_____ Date_____

1. THE STUDENT AGREES TO:

____Do an honest day's work, understand that the cooperator must profit from his labor in order to justify hiring him and providing him with cooperative training experience
____Do all jobs assigned to him to the best of his ability
____Be punctual, dependable and loyal
____Follow instructions, avoid unsafe acts, and be alert to unsafe conditions
____Be courteous and considerate of the cooperator, his family, customers and others.
____Keep the records of cooperative training program and make the reports the teacher and employer require.
____Be alert to perform unassigned tasks which promote the welfare of the business.
____Notify the employer and teacher-coordinator if he is unable to be on the job as scheduled.

---

2. THE PARENT AGREES TO:

___The cooperative training program in the place of business.
___Allow student to work in the store during hours and days shown in Sec. 5.
___Provide a method of getting to and from work according to the work schedule.
___Assist in promoting the value of the student's experience by cooperating with the cooperator and teacher when needed.
___Assume full responsibility for any action or happening pertaining to student trainee from the time he leaves school until he reports to his training station.

3. THE TEACHER-COORDINATOR IN BEHALF OF THE SCHOOL AGREES TO:

___Give systematic instruction at the school enabling the student to better understand and carry out his duties and responsibilities in the training station.
___Visit the student on the job for the purpose of supervising him to insure that he gets the most out of his cooperative training experience.
___Work with the cooperator, student, and parents to provide the best possible training for the student.
___Use discretion on the time and circumstances chosen for visits.

4. THE COOPERATOR AGREES TO:

___Provide the student with opportunities to learn how to do well in jobs in the occupation.
___Assign the student new responsibilities only when he is judged able to handle them.
___Train the student, when and where possible, in the ways which he has found desirable in doing his work.
___Assist the teacher in making an honest appraisal of the student's performance.
___Inform the student of safety procedures and avoid subjecting him to unnecessary hazards.
___Refuse employment to any trainee for at least 90 days if he drops out of school.

---

5. ALL PARTIES AGREE TO:

___A period of the cooperative training program which will
Start in_____
(month)
End in _____
(month)
___Working hours during the cooperative training program will include:

Days during week_____
Hours during week days_____to_____
Hours on weekend _____to_____

___Discuss misunderstanding on termination of employment before ending employment.
___A beginning wage of_____per hour.

We, the undersigned, indicate by the affixing of our signatures that we have read and understand the purpose and intent of this training agreement.

Section X

PLACEMENT OF TRAINEES IN TRAINING CENTERS

The placement of qualified trainees in suitable training centers is a rewarding climax to the efforts expended in making surveys of the community and school, canvassing employers, publicizing the program and selecting qualified students for training.

After the list of qualified trainees and suitable training centers has been completed, the teacher-coordinator has a big job in insuring that the proper trainee is placed in the right training center. However, the final selection of the trainee to work in a particular training center should be made by the cooperator.

Following is a list of activities that the coordinator can perform to help place the proper trainee in a desirable training center.

1. If possible, before a student applies for a job, give instruction on job classifications, human relations and methods in applying for a job.

2. From the list of eligible students select those that are most interested and qualified for each particular occupation.

3. Give the list to the proper cooperator and let him select the students he wants to interview.

4. If some jobs require an application form, guide the student in completing this form, but let the student gain the experience of actually completing such a form.

5. In some cases, the teacher-coordinator may wish to go with the student and introduce him to the cooperator. The teacher-coordinator from his knowledge of the student, should know whether to use this procedure or not.

6. After the cooperator has had an opportunity to interview the students, the teacher-coordinator should assist him in his selection by furnishing all the information available about each student. This can best be done by letting him review the "Student Information Sheet". The teacher-coordinator should refrain from giving his personal recommendations or arbitrarily assigning a trainee to a training center. Remember, the final selection of the final selection of the trainee should be made by the cooperator.

Section XI

TEACHING RELATED INSTRUCTION

Related instruction will be of two types: A core of common and specific related instructions.

The common related instruction will be presented to all students regardless of the occupation in which they are working. In the teaching of common related instruction, all the various methods and techniques of regular vocational agriculture may be used. Following is a list of possible topics to be included in the related instruction. In most instances additional topics will be needed.

1. Becoming familiar with the Agricultural Implement. Occupations Program.
2. Determining the importance of agriculture in the community.
3. Chosing a career.
4. Applying for a job.
5. Developing desirable personal traits.
6. Budgeting your income.
7. Saving and investing
8. Taxes
9. Labor Unions
10. Employer-employee relations
11. Your personality
12. Business forms and documents.
13. Social and business etiquette
14. Business ethics
15. Social Security, income tax, withholding, fringe benefits, etc.

The specific related instruction has to do with the information and knowledge needed for competency in a skilled occupation. The material which a trainee studies during the specific related instructional period will be determined from the training plan and should be correlated with his work experience. A trainee study guide should be developed for each occupation in which training is offered.

SECTION XII

COORDINATION OF THE PROGRAM

The objective of coordination in the agricultural mechanics occupations program is to correlate all the helpful agencies and factors that contribute to the successful training of students. Many people are confused concerning the actual duties of coordination. An adequate job at coordination involves many duties. Some of the duties associated with coordination are:

1. Placement of trainees in suitable training centers.
2. Follow-up of trainees after placement.
3. Contacts with cooperators to establish working relationships.
4. Assist in making analysis of various occupations.
5. Assist in developing training plans.
6. Conferences with students.
7. Contacts with consultant committees.
8. Evaluating student progress in relation to training plan.
9. Contacts with employers, labor groups, school administrators and vocational counselors regarding the functioning of the program.

COORDINATORS SCHEDULE OF CLASSES

The amount of time a teacher-coordinator should devote to the program during the regular school day would depend on many factors. Sufficient time should be allotted during regular school hours for coordination. At least one hour per day should be scheduled for the related instruction. Since the teacher-coordinator has a vital role in student guidance, at least one period per day should be scheduled for student conferences.

TEACHER SUPERVISION OF TRAINEE ON THE JOB

Periodic visits to the training centers are necessary for efficient program operation. They are valuable in correlating related classroom instruction with on-the-job training; in making comparisons between actual work accomplished with the training plan content; and in evaluating student progress on the job.

It is not practical to specify an exact number of visits to each training establishment. Each training situation differs. It is necessary to make more frequent visits in some situations than at others. On the average, however, the teacher-coordinator should visit each center once a week.

Following is a list of information to gather when a coordinator makes a supervisory visit.

1. Is the cooperator satisfied with the trainee?

2. What is the trainees attitude toward his job, employer and fellow workers?

3. Is the trainee progressing according to the training plan?

4. The trainees have friends who visit them while on the job.

5. The cooperator fails to provide adequate training.

6. The cooperator expects work from the trainee at irregular hours.

When supervising trainees, it is appropriate that the cooperator be made aware of the visit. It is a simple courtesy to clear the visit through the person in charge. If the cooperator wishes to discuss something personally about the trainee, it is best to hold the conference away from the trainee and his work area.

Following is a list of "Do's" and Dont's" to follow while visiting training centers.

DO

1. Be alert. Observe what is going on without appearing to "snoop".

2. Be friendly with everyone without fraternizing with them.

3. Show an interest in the work in progress. Be curious; ask questions if the opportunity presents itself.

4. Make notes (after leaving) on items which may be used for a conference with the trainee or for his study assignments.

5. Be quick to sense the cooperators desire to terminate a conference.

DON'T

1. Don't call attention to errors, bad practices, unsafe conditions, and the like while visiting the trainee. Do so in private conference.

2. Don't try to demonstrate to a trainee how to do a job to which he is assigned.

3. Don't pose as an expert or authority on any matter concerning the work going on.

4. Don't request a conference with the cooperator when he is obviously too busy.

5. Don't engage in so-called "friendly" arguments on controversial questions.

6. Don't interrupt or interfere with the trainee's work.

7. Don't permit a visit to degenerate into a "bull" session with the cooperator or employees.

8. Don't appear to be loafing or just "passing the time."

9. Don't handle tools, machines, or equipment unless invited to do so.

Some other general points in connection with supervision of the trainees at the training center are:

1. Plan a weekly schedule in advance so that the most benefit can be derived from the time available. This also enables persons to contact the teacher-coordinator when he is not at school.

2. Check out with the school office each day before leaving the school. Indicate when you will return to the office.

3. Keep a record of your observations on each visit to the training center. An example of a visitation form is found on the following page.

TEACHER-COORDINATOR'S VISITATION RECORD

TRAINING CENTER _____ OFFICIAL CONTACT _____

TRAINEE _____

DATE _____ TIME OF VISIT _____

Points to observe	Comments
1. Conditions surrounding the business	
2. Attitude of workers toward teacher-coordinator and trainee	
3. Specific operations in which trainee is engaged.	
4. Immediate related subject matter needed.	
5. Personal appearance of the trainee.	
6. Apparent interest of trainee in his work.	
7. Apparent interest of cooperator in the trainee.	
8. On-the-job instruction being given.

EVALUATION

EMPLOYER-TEACHER EVALUATION

Instructions: Please rate the trainee on each of the competencies (abilities) listed below. Rate by placing a check mark in the appropriate column to the right of each competency. Use the following as a basis for rating.

x -- No chance to observe
1 -- Below average
2 -- Average
3 -- Above average
4 -- Excellent
5 -- Superior

GENERAL COMPETENCIES (Abilities)	x	1	2	3	4	5
Accepts and carries out responsibilities						
Attitude toward work; use of work time						
Adaptability; ability to work under pressure						
Speed and accuracy of work						
Attentiveness to work being done						
Promptness in reporting for work						
Care of work space						
Care of materials and equipment						
Observing, imagination						
Attitude toward customers						
Attitude toward fellow worker, supervisors						
Personal appearance, grooming, fitness						
Initiative						
Enthusiasm						
Cheerfulness, friendliness						
Courtesy, tact, diplomacy, manners						
Helpfulness						
Honesty, fairness, loyalty						
Maturity, poise, self-confidence						
Patience, self-control						
Sense of humor						
Selling ability, personality for selling						
TOTAL						

JOB SKILLS	x	1	2	3	4	5
Knowledge of Job						
Mechanical ability						
Penmanship						
Speech, ability to convey ideas						
Care of tools, orderliness						
Use of good English						
Desire to serve farm people						
Like people, not a fear of people						
Complete job						
Check parts orders						
Determine sale price						
Use an adding machine						
Write up parts orders						
Write up service order						
Total						

Rating for liabilities:

x - No opportunity to observe
1 - Not noticeable
2 - Seldom noticed
3 - Frequently noticed
4 - Highly noticed
5 - Pronounced

LIABILITIES	x	1	2	3	4	5
Annoying mannerisms						
Familiarity						
Making excuses						
Tendency to argue						
Tendency to bluff or "know it all"						
Tendency to complain						
Total

TRAINING MEMORANDUM FOR AGRICULTURAL MECHANICS OCCUPATIONS

This establishes an agreement between _____
(School)
and _____ regarding the employment of _____
(Training Center)
_____ in _____
(Trainee) (Occupation)

1. The on-the-job training will be supervised by _____ ,
(Teacher-Coordinator)
_____ for a period of _____ weeks.
(Cooperator)

2. The student will begin training on _____ at a beginning wage of
(date)
_____

3. The school will provide the student one hour per day for related classroom study and two hours per day for on-the-job training. The school will be responsible for providing technical and related instruction.

4. The trainee shall gain experience in all phases of the occupation listed in the Training Plan.

5. The schedule of compensation shall be fixed by the consultant committee.

6. The Vocational Agriculture Instructor will visit the training station at frequent intervals to observe the student on the job and to discuss and evaluate his progress with his employer.

7. The trainee agrees to perform his duties at the training center and in school diligently and faithfully.

8. The training relation may be dissolved by any of the parties directly involved, but should be preceded by consultation with the teacher-coordinator.

9. No regular employee shall be laid off to train students.

10. If the trainee drops out of school, he will not be employed by the training center for a period of at least 90 days.

We the undersigned are familiar with, and agree to the above provisions.

Instruction in Agricultural Mechanics Occupations Program

Specific agricultural skills, abilities, and understandings are needed by managers and employees in retail farm machinery distribution in order to carry out their functions efficiently. Educational programs should be developed at the high school level to provide training in these competencies.

It is suggested that the enclosed type of instructional program may be followed in a high school offering this type of training.

<u>Ninth Grade</u>

Production Agriculture
Development of S.F.P.
Encouragement in FFA
Farm Mechanics
1. Beginning Welding
2. Adjustment, Maintenance, and Repair of Small Gasoline Engines
3. Tool Identification

<u>Tenth Grade</u>

INDIANA ASSOCIATION OF FFA

Agriculture Occupations Awards Program

Purpose

To encourage good agriculture occupations programs and help develop programs where there is a need in the community.

Eligibility

1. The Agriculture Occupations activity is for students in FFA who are enrolled in state approved agriculture occupations programs, which includes students placed in agriculture businesses or farms.

2. To be eligible a member must, at the time of application, be regularly enrolled in all-day classes in vocational agriculture or have been out of school for not more than one year.

3. All applicants must be either juniors, seniors, or in their first year out of school to apply for this award.

General Instructions

1. All applications are due in the state FFA office by May 15.

2. Complete the application as of May 1 of the year in which the award is sought. Report no achievements or income after May 1.

Awards

The following awards are made available to the Indiana FFA Association by the National FFA Foundation.

1. Chapter level

   a. Award medals similar to the National Foundation medals will be made available to all chapters desiring to present a local chapter award in agriculture occupations.
   b. Estimated cost $75.

2. District level

   a. An awards plaque for the individual and one for his chapter will be presented at the district FFA contest meeting.
   b. Estimated cost $25 for each district.
   c. Total cost $300.

3. State level

   a. All district FFA winners will participate in the state contest to be held at the state convention.
   b. State awards:

First Place-	$100 to individual, a plaque for the chapter and the student, plus $25 for state fair display.
Second Place-	$25 plus $25 for a state fair exhibit
Third place-	$15 plus $25 for a state fair exhibit. (Display funds will be payable after the state fair).

APPLICATION FOR AGRICULTURAL OCCUPATION ACTIVITY

Eligibility Rules

1. This FFA activity sponsored by the National FFA Foundation is for students in FFA who are in State approved agricultural occupations programs which includes students placed in agricultural businesses or farms.

2. To be eligible, a member must, at the time of application, be regularly enrolled in all-day classes in vocational agriculture or have been out of high school for not more than one year.

3. All applicants must be either juniors, seniors, or in their first year out of school to apply for this award.

General Instructions

1. All applications are due in the state FFA office by May 15.

2. Complete the application as of May 1 of the year in which the award is sought. Report no achievements or income after May 1.

SUMMARY OF INDIANA CHILD LABOR LAWS

Cooperative Vocational Programs-Standards

Any public school corporation may through its appropriate officials enter into cooperative programs with employers of labor wherein said employers agree to provide employment for students, enrolled in school-directed vocational education programs, to learn the manipulative skills or manual processes of an occupation and such employers are hereby authorized to employ such students in otherwise restricted occupations for the purpose of vocational education training under the following conditions:

(1) That training in the occupation is approved by an authorized school authority and is school supervised.

(2) That the training station of the occupation is jointly approved as to conditions of work, including safety factors, by the safety inspectors of the Indiana Division of Labor and the proper school authorities.

(3) That the student in training is assigned to competent adults delegated by the employer for instruction and supervision in the manual processes or manipulative skills of the occupation according to a written training schedule jointly developed by the employer and a representative of the school. (Acts of 1957, Chap. 269, Sec. 1; Burns 28-4904a.)

Workmen's Compensation and Occupational Diseases-Right of Recovery

A student participating in a vocational education program and employed under the conditions of Section 4a hereof shall be entitled to the rights of recovery of an adult worker under the Indiana Workmen's Compensation and Occupational Diseases laws and there shall be no right to recover any additional benefit otherwise payable as a result of his being a minor and he shall be deemed the employee of the employer while performing services for the employer under the provisions of and in accordance with Section 4a hereof. (Acts of 1957, Chap. 269, Sec. 2; Burns 28-4904b.)

Restricted Occupations-Exemption From

Employers and students while complying with the provisions of Section 4a hereof shall be exempt from the provisions of Sections 22 and 23 of Chapter 132, Acts of 1921. (Acts of 1957, Chap. 269, Sec. 3; Burns 28-4904c.)

Employment of Minors-Proof of Qualifications-Issuing Officer

It shall be unlawful for any person, firm or corporation to hire or employ or permit any minor between the ages of fourteen (14) and eighteen (18) years to work in any gainful occupation until such person firm or corporation shall have secured and placed on file in the office of such person, firm or corporation a certificate issued by the issuing officer of the school corporation in which said minor resides. The issuing officer in all cities and incorporated towns having boards of school trustees shall be the superintendent of the schools of such city or such incorporated town or some person designated by him in writing so to act, and in all other school corporations the issuing officer shall be the county superintendent of school or some person or persons designated by him in writing so to act: Provided, That no school superintendent shall designate an issuing officer without the approval of the state attendance officer. The issuing officer of such school corporation or the person authorized by him in writing so to act shall issue such certificate only to a minor whose employment is necessary and not prohibited by law, and only upon receipt of the following four documents herein referred to as proof of age, proof of physical fitness, proof of schooling, and proof of prospective employment.

SECTION XIX

U. S. FAIR LABOR STANDARDS ACT

The Fair Labor Standards Act applies to employees (including student-learners) engaged in interstate commerce or in the production of goods for interstate commerce, including any closely related process or occupation directly essential to such production, unless specifically exempt by some provision of the act. The act also applies to employees (including student-learners) who are not themselves engaged in or producing goods for commerce but who are employed in certain large enterprises engaged in commerce or in the production of goods for commerce. Popularly known as the Federal Wage and Hour Law, this act establishes minimum wage, child-labor, and maximum hours and overtime standards for employment subject to its provisions.

Some of the occupations which these students will pursue will be those occupations that come under the U. S. Fair Labor Standards Act. It should be determined without any doubt if any occupation chosen by the student is affected by this act. This should be done in order that no student, school or employer violates any of the provisions of this act, either willfully or unintentional. The following material deals with the provisions of the act as it relates to the employment of students in agricultural occupations.

1. Hours

The number of hours at work and in school shall not exceed 40 hours per week. When school is not in session on any school day, the student-learner may work a number of hours in addition to the weekly hours of employment training, provided the total hours worked shall not exceed 8 hours on any such day. A notation should be made in the employer's records to the effect that school not being in session was the reason additional hours were worked on such a day.

During the school term when school is not in session for the entire week, the student-learner may work at his employment training a number of hours in the week in addition to those authorized provided the total hours shall not exceed 40 hours in any such week.

2. Wages

Students may be paid at a lower rate than the minimum set by law. This can be done only by making application for a student-learner certificate and receiving approval. This certificate allows the employer to pay the student-learner at a wage rate per hour of 75 per cent of the minimum wage. It is suggested that a progressive wage schedule be proposed. If this is done the starting rate must not be less than 75 per cent of the minimum wage.

If the occupation in which the student is employed is not covered by the minimum wage law, the appropriate wage shall be determined by the employer and the advisory committee .

SECTION XX

FOLLOW-UP OF STUDENTS

Schools offering training in Agricultural Mechanics Occupations should provide some method of "following-up" or system of determining what has happened to the students that took the training. This should include such activities as helping students locate permanent positions, keeping a record of students employment, and other pertinent information on all former students.

One way of evaluating a program of this type would be to determine how many of the students became gainfully employed in the occupation for which they received training. The following form may be used as a means of getting the information needed for this evaluation. This form can become a part of the permanent record of each student.

GLOSSARY

1. Consultant Committee - A group of persons usually outside the educational profession, selected for the purpose of offering advice and counsel to the school regarding the vocational program. Members are representatives of the people who are interested in the activities with which the vocational program is concerned.

2. Cooperator - The businessman who provides a training center for use by the school.

3. Evaluation - A term used in education indicating the procedure for determining the effectiveness of instruction.

4. On-the-job Training - Instruction in the performance of a job given to an employed worker by the employer during the usual working hours of the occupation. Usually the minimum or beginning wage is paid.

5. Related Instruction - Classroom and laboratory instruction designed to increase knowledge, understanding, and ability to solve technical and theoretical problems concerned with a particular occupation.

6. Service Occupations - Those occupations which have as their primary purpose the rendering of personal service to the customer or maintenance of existing equipment.

7. Student Learner Certificate - A certificate which will enable students enrolled in a training program to be exempt from certain provisions of the Fair Labor Standards Act.

8. Study Guide - The study guide should contain key questions, problems, and other assignments to enable the trainee to become familiar with the information which the training plan lists as being pertinent to the on-the-job training. The study guide should also list the reference and, in some cases, present basis information so that the trainee may comprehend the material by working on an individual basis.

9. Supervisor - The person directly responsible for training the student at the training center.

10. Teacher-Coordinator - A member of the school staff who teaches the related and technical subject matter involved in work experience programs and coordinates classroom instruction with on-the-job training.

11. Technical Agriculture - An inclusive term which embraces a cluster of agricultural occupations engaged in the science, mechanical, and technical phases of production, distribution, manufacturing, use, processing, and marketing of farm products.

12. Trainee - A member of a high school cooperative education program legally employed as a part-time worker and so classified by the Wage and Hour and Public Contracts Divisions of the U. S. Department of Labor for wage and hour regulation purposes.

13. Training Agreement - An outline of learning experience an employer agrees to provide for a student-learner enrolled in the various co-op education programs.

14. Training Plan - A listing of the activities in which the trainee will be engaged at the training center. In addition, it contains a listing of the information to be taught in the related instruction class.

15. Training Center - The agricultural business or firm in which the trainee will work while participating in the agricultural sales and service occupations program.

16. Work Experience Education - Employment undertaken as part of the requirements of a school course and designed to provide planned experience, in the chosen occupation, which are supervised by a teacher-coordinator and the employer.

Title 45—PUBLIC WELFARE

Chapter I—Office of Education, Department of Health, Education, and Welfare

PART 104—ADMINISTRATION OF VOCATIONAL EDUCATION; FEDERAL ALLOTMENTS TO STATES

Miscellaneous Amendments

Part 104 of Title 45 of the Code of Federal Regulations, dealing with programs of vocational education administered by State boards for vocational education under the Smith-Hughes, George-Barden, and supplementary Acts as amended and under the Vocational Educational Act of 1963, is amended by the provisions contained in the following paragraphs. These amendments are effective as of August 21, 1964, the date on which Part 104 was approved. State plan amendments in conformity with these amendments to the regulations may, at the option of the State, be made effective as of the effective date of the State plan, or any other date thereafter.

1. Subparagraph (1) of § 104.13(a) is amended to read as follows:

§ 104.13 Programs for vocational instruction.

* * * * *

(a) *Arrangements for instruction.*

(1) Such instruction will be provided either (i) with respect to funds provided under all the acts, by the State board or local educational agency in schools and classes conducted under public supervision and control meeting the criteria of subparagraph (2) of this paragraph, or (ii) with respect to funds provided under the 1963 Act, under contract with the State board or a local educational agency.

* * * * *

2. Paragraph (e) of § 104.25 is amended to read as follows:

§ 104.25 Requirements of work-study program.

The State plan shall provide that a work-study program meet the following requirements:

* * * * *

(e) *Maintenance of effort.* In each fiscal year during which a work-study program remains in effect, the local educational agency will expend for employment of its students an amount in State or local funds that is at least equal to the average annual expenditure for work-study programs of a similar nature during the 3 fiscal years preceding the fiscal year in which the work-study program of such local educational agency was approved.

* * * * *

3. Section 104.29 is amended to read as follows:

§ 104.29 Date of allowable expenditures.

Since the Federal Government participates only in amounts expended under the State plan, Federal financial participation shall be available only for expenditures which are made after the effective date of the State plan (as defined in § 104.2(a)), except as provided with respect to work-study programs in § 104.45(b).

4. Section 104.30 is revised to read as follows:

§ 104.30 Allotment availability.

Federal funds allotted or reallotted to a State under the acts shall be available only for expenditures for program activities or construction projects which are carried on under the plan and which are attributable to the fiscal year for which such allotments or reallotments are made. (See § 104.33.)

5. Section 104.33 is amended to read as follows:

§ 104.33 Determination of fiscal year's allotment to which expenditure is chargeable.

(a) Each allotment or reallotment to a State under the acts is made with respect to a fiscal year commencing on July 1 and ending the following June 30.

(b) For the purpose of earning the Federal allotments under the acts, State and local laws and regulations shall be followed by the State in determining to which Federal fiscal year an expenditure by the State board, local educational agency, or other participating agency or institution is chargeable, except as provided in paragraphs (c), (d), and the last sentence in this paragraph. Each State shall therefore use the accounting basis applicable to its State or local accounting. The State plan shall specify for State and local expenditures the particular accounting basis to be so used indicating precisely the acts or occurrences necessary to charge an expenditure to a particular time period for States or local purposes, and cite the authority under State law for such a basis. If the State or local educational agencies utilize a basis other than a cash accounting basis, the State plan shall indicate the time period or other factors governing the liquidation of obligations. In order for the State or local educational agencies to be on an obligation basis, an obligation shall mean only a bona fide commitment which is supported by a contract or other evidence of legal liability consistant with State purchasing procedures.

(c) For the purpose of the regulations of this part, an "expenditure" shall not include administrative approval of a program or project by the State board or local educational agency, or the advance or reimbursement by the State board of funds which are or will be expended by a local educational agency or other participating agency or institution under the State plan. None of such actions may be used as a basis for determining to which Federal fiscal year an expenditure by such board, agency, or institution is chargeable for the purpose of earning the Federal allotment, except as provided in paragraph (d) with respect to construction projects and paragraph (e) with respect to work-study programs.

(d) Notwithstanding the provisions of paragraphs (b) and (c) of this section, the State plan shall specify the basis for charging costs of construction to a Federal fiscal year which indicates precisely the acts or occurrences necessary to charge such costs to a particular time or time period and which is not in conflict with State and local laws, rules, regulations, and standards. (See § 104.31.) If such a basis results in charging the costs of construction to a date prior to that of entering into a construction contract, the State plan shall also indicate within what reasonable period of time after the date of charging the Federal allotment such construction contract must be entered into.

(e) Notwithstanding the provisions of paragraphs (b) and (c) of this section, expenditures for special summer work-study projects shall be charged to the allotment under section 13 of the Act for the fiscal year in which such projects have been approved for expenditure during the months of July and August immediately following such fiscal year.

6. Subparagraph (3) of § 104.42(c) is amended to read as follows:

§ 104.42 Matching purposes within specific allotments of Federal funds.

* * * * *

(c) *Allotments under Smith-Hughes and George-Barden Acts.* * * *

(3) Funds allocated by the States under the Smith-Hughes Act for salaries of teachers of home economics subjects pursuant to subparagraph (1)(i) of this paragraph, and funds allotted to the States under section 3(b) of the George-Barden Act for vocational education in home economics may be allocated by the States to each of the matching purposes specified in § 104.41(d) (2) and (3) and (e) (3) and (4), provided that in each fiscal year beginning after June 30, 1965, at least 10 percent of such allocations or allotments may be used only for home economics for gainful employment as specified in § 104.41(d) (2) and (e) (3).

Dated: June 17, 1965.

[SEAL] HENRY LOOMIS,
Acting U.S. Commissioner of Education.

Approved: June 23, 1965.

ANTHONY J. CELEBREZZE,
Secretary of Health, Education, and Welfare.

*SERVICE OCCUPATIONS; *HOMEMAKING SKILLS; HOME MANAGEMENT; MAIDS; WORKING WOMEN; OCCUPATIONAL HOME ECONOMICS; *ACTION PROGRAMS (COMMUNITY); *JOB DEVELOPMENT

Materials have been compiled to assist local leaders of Community Committees on Households Employment in gaining community support for job development and training programs designed for household services to meet community needs to upgrade the skills and status of household workers. Such a Committee program introduces a new concept whereby community groups sponsor training programs with the ultimate goal of forming non-profit organizations, business enterprises, or employer cooperatives to insure satisfactory employment conditions. Workers gain status, fringe benefits, and wage stability. Employers can expect trained employees, dependable service with replacements for illness, and the convenience of monthly billing. Training programs can be funded under the Manpower Development and Training Act of 1962. The materials are categorized under (1) How to Organize a Community Committee, (2) What Some Communities Are Doing-Specialized Services, (3) New Concepts in Training and Job Development, (4) Community Resources for Training, Placement, and Job Development, (5) Recruitment Techniques for Household Workers Training Programs, (6) Suggested Topics for Group Discussion and Study, (7) An Outline for Publicity Programs, and (8) Guidelines for a Survey to Determine Existing Working Conditions, Demand for Workers, and Employer-Employee Attitudes. Reference materials for leaders include historical highlights, charts giving household worker data, and recommended reading. (FP)

FOREWORD

The National Committee on Household Employment is a non-profit organization with headquarters in Washington, D. C., incorporated October, 1965 to provide leadership in promoting and establishing standards for private household work; to improve the economic and social status of household workers; to stimulate job development and training programs for household and related service workers; and to serve as the liaison with government, private and community agencies interested in this field.

Under a contract with the U. S. Labor Department, the National Committee is currently sponsoring a developmental demonstration project to promote, coordinate and evaluate six to eight pilot training programs for household and related service workers which will demonstrate innovative methods and techniques of recruiting, counseling, training and placing trainees.

To assure the success of these programs and to stimulate the development of similar projects throughout the United States, the NCHE has assumed a second responsibility to establish Community Committees on Household Employment. Such committees will be comprised of the local counterparts of the organizations represented on the NCHE, representatives of public and private employment agencies, vocational education agencies, service organizations, women's groups and interested individuals. They can be a powerful force in achieving the goals of the NCHE and are essential to the success of the program.

The materials which follow have been prepared to assist local leaders in marshaling community support to revitalize and bring a new image to the occupation of household services.

THE CHALLENGE

ACTION at the local level must begin with community committees. Only local residents know the household employment problems in their community. Are there mature women who are looking for satisfying jobs? Are there families in need of help who can afford to hire a trained person? Are there training opportunities for young people who want to stay in the community to earn money for further education? Is a large amount of entertaining done in the homes of the community? Are there skilled workers available to help with this entertaining? Are there many couples living in apartments who would be helped by a daily light cleaning service? Are there young children, or elderly persons in need of daily care in their homes? Are any of these problems in your community?

Leaders who are concerned with upgrading the skills and status of household workers and meeting the community needs for household services must find the answers to these questions and strive for solutions of the problems existing in their areas.

Perhaps the challenge is best stated in the words of Mrs. W. Willard Wirtz, wife of the Secretary of Labor, as she accepted the Honorary Chairmanship of the National Committee on Household Employment that "here is an opportunity to prove by deeds the sincerity of what we have all been saying about the importance of this group of services to our society."

GUIDELINES TO COMMUNITY ACTION

Leaders who are concerned with upgrading the skills and status of household workers and meeting community needs for household services, drawing upon many community resources, can take an active part in:

- Organizing a Community Committee on Household Employment;
- Conducting surveys to determine working conditions, demand for workers and employer-employee attitudes;
- Stimulating the development of training programs;
- Recruiting trainees;
- Recruiting employers to provide working experience opportunities and supervision for trainees;
- Encouraging new concepts in job development;
- Establishing standards for workers;
- Conducting discussion groups and alerting the community to problems and the need for action to relieve them.

This kit contains some specific suggestions for accomplishing a number of these tasks. The others are in areas where there has been little action. The NCHE is looking to your communities for innovative approaches to their solutions.

I. HOW TO ORGANIZE A COMMUNITY COMMITTEE

Contact other local units of the national organizations affiliated with the NCHE to enlist their cooperation.

Enlist representatives of other service organizations, professional associations, women's groups, public and private agencies and *The Governor's Commission on the Status of Women.

Invite household employers and employees to be members of the Committee.

Invite a local representative of your State Employment Service, Director of Vocational Education, Coordinator of Manpower Programs and *the Regional Representative of the Women's Bureau of the U. S. Department of Labor.

Plan a meeting to formulate an action plan.

II. WHAT SOME COMMUNITIES ARE DOING – SPECIALIZED SERVICES

The following projects are examples of what can be accomplished by community cooperation. As in the development of most successful ideas, a creative person has seen a need and stimulated others to work on the solution. Frequently resources to fill a need are at hand but someone must take the lead in bringing these resources together. Although these projects answer different community needs, they have several factors in common. In each project . . .

. . . Training was structured to develop wage earning skills for which employers are willing to provide payment commensurate to the quality of work performed.

. . . Workers were helped to understand their roles in the working world and have an opportunity to develop personal characteristics and job attitudes as well as occupational skills.

. . . The staff and volunteers of a local organization or agency provided the leadership.

. . . All planning for the training was done by professionals, either volunteers or agency staff.

. . . Persons skilled in each particular area conducted the training.

. . . Equipment and supplies of the quality and types used in the homes in which the workers would be employed were used in the training.

. . . The cooperation of the state employment service was enlisted in setting up procedures for placing graduates.

The Need: Temporary Help for Parties

The Answer: Cleveland, Ohio — PARTY AND DINNER AIDES

Six years ago a homemaker wanted to employ extra help for a family Christmas party and found no one available. Spurred on by other homemakers with similar problems, she went to the principal of a vocational high school. In response to her request, the public schools' Adult Education Program teamed up with the Vocational Guidance and Rehabilitation Services to offer a one semester 40-hour course for party and dinner aides. This program, still in operation, not only gives needed help to local party-givers, but also provides training for unskilled workers in evening classes. Although there is a fee for the course, a women's service club or the welfare department pays for those unable to do so. Each graduate is fitted with a uniform and two aprons. A placement service helps the graduates find a job at no cost to employee or employer. During training the students learn how to do the last minute jobs for a party such as preparing hors d'oeuvres, salads, gravy, coffee, and setting the table. They are trained in serving and in cleaning up the kitchen and dining area after the party. They learn how to handle fine table appointments and family treasures.

Graduates are given cards of introduction to inform the employer of expected wages, hours, and arrangements for transportation. There is a procedure for evaluating the work of the party aide. A memorandum to the employer from the sponsors of the class outlines exactly what the aide can and cannot do, and some of the suggestions for ways for the employer to make the job satisfactory for both the employer and employee.

In operation since 1960 this training program has many graduates who have more work than they can handle.

The Need: Jobs For High School Girls

The Answer: Sikeston, Missouri — OCCUPATIONAL HOME ECONOMICS

A Missouri high school home economics instructor used imagination in helping her students become wage earners. With full cooperation of the

high school guidance department, the administration, and of the community, an occupational home economics course was established in Sikeston High School. The full-year course trains high school seniors in all aspects of housekeeping, from meeting people in the home, through cleaning, laundry, meal planning, preparation and serving, care of equipment, household emergencies, care for the sick or for children and adults during absence of the homemaker. In addition to classroom instruction, each student works in a home under the supervision of a homemaker associated closely with the teacher.

Community cooperation was evidenced by the striped denim wrap-around uniforms given to the students by a Sikeston bank. Several of the graduates of the first class are presently employed either full or part time and one plans to earn her way through college with this type of part-time employment.

The Need: Part-time Work For Mature Women.

The Answer: California -- FAMILY AIDES

The California State Department of Employment became aware of the large number of mature workers who desired part-time or temporary employment in the Los Angeles metropolitan area. Joining local volunteer agencies the employment service sponsors a much-needed Family Aide Service utilizing the talents of these women with backgrounds in social work, teaching or various other fields. The graduates, trained in cooperation with the American Red Cross and the city or county health departments, are prepared to perform those functions which would make it possible for the old or infirm to remain in their own homes. The aides are not primarily household workers nor are they trained to perform medical duties. The training program includes nutrition, food management, psychology of the aging, environmental health and non-nursing skills related to their work. The twelve-hour training course is free. Typical duties of the Family Aides include grocery shopping, driving to medical appointments, reading aloud, writing letters and preparing lunch.

The Need: Emergency Help For Families

The Answer: Nevada Indian Reservations — HOME HEALTH AIDES

A chaotic family life for Indians has often resulted from the lack of competent help in time of emergencies. Inadequate nutrition, too, has been a perennial Indian problem. Recognizing these problems, the Nevada Cooperative Extension Service conducted home health aide training courses for women from three reservations in Nevada. The Bureau of Indian Affairs, Public Health Service, local health and welfare department personnel as well as the tribal council and the local area development committee cooperated in enrollment efforts. Students were trained for part-time work as household helpers and also learned skills to help them give their own families better care and nutrition. The extension home economists taught sessions on food, nutrition, and housekeeping and called on local resource people to conduct classes on working with people, prenatal care, understanding the elderly, home health care, first aid and emergency treatment. The Nevada Employment Service discussed employment possibilities and the use of the local employment service office. As an indication of the acceptance of this program, the tribal council on a neighboring reservation has requested a similar course for their people. Many of the graduates of the first courses are employed as home health aides, relieving Indian families in times of real need.

The Need: Care For The Elderly At Home

The Answer: Lorraine, Ohio — CERTIFIED HOUSEHOLD ASSISTANTS

"Almost every community today has a few elderly people who cannot quite manage by themselves, yet hesitate to enter a nursing home." So began an article in the JOURNAL, Lorraine, Ohio, October 10, 1962, to announce a demonstration program in Lorraine.

The YWCA had called on the city welfare department, the state employment service and local volunteer agencies to help plan a training program to equip women workers to care for these older people living at home. The program was designed to meet two community needs: provide trained workers to meet this demand, and provide an occupation for women who are seeking

employment. The YWCA coordinated the 40-hour course, which was given without cost to the trainees. Expenses of training were paid by the Lorraine Business and Professional Women's Club and the Red Cross. The employment service tested and screened applicants, the American Red Cross and YWCA staff and volunteers were the instructors. Graduates received a Certified Household Assistant certificate as well as a Red Cross Home Nursing Certificate.

These are examples of WHAT SOME COMMUNITIES ARE DOING . . . . .
to solve their particular household problem.
Each demonstrates one method of approaching a solution.
There are other ways.

Your community committee can find the best method of bringing living wages and a new stability and status to the occupation of household worker, and, at the same time, produce skilled persons to fill a pressing demand for labor.

III. NEW CONCEPTS IN TRAINING AND JOB DEVELOPMENT

As the work of the National Committee on Household Employment progresses, a new concept in training and placing household workers is emerging. Under this new concept, the sponsor assumes the multiple responsibilities of training, placement, and offering the graduate the opportunity to become a full-time employee of the sponsoring group.

The latter responsibility introduces an element never before present in such programs — that of giving the graduate a multitude of advantages not available in the present one-to-one relationship of household worker to household employer.

This new concept is being received with enthusiasm by those dedicated to raising the status of household employment as an occupation. These include community groups who wish to sponsor training programs with the ultimate goal of forming non-profit corporations, business enterprises or employee cooperatives as a means of insuring satisfactory conditions of employment. (See reprint following this section.)

As employees of these corporate bodies workers will enjoy the wages, fringe benefits and status offered by other occupations. They may look to their corporate employer for proper wages and working conditions, vacations, participation in low cost hospitalization, workmen's compensation, job titles, further training and advancement. Workers will also benefit through the protection of unemployment insurance, elimination of intermittent employment and increased credit standing. In addition, they can rely on the corporate employer to eliminate many of the frictions and misunderstandings which contribute to the irregularity of existing employment relationships between household workers and household employers.

This approach can also offer numerous benefits to those in need of household assistance. They will receive the services of a trained employee; will

have no responsibility for bookkeeping and tax withholding; will have the convenience of a monthly billing; will be assured of dependable service at times agreed upon as substitutes will be provided in cases of illness or emergencies; and will have an opportunity to work with a competent counselor of the agency.

The training programs now being developed are geared toward full-time employment and will give graduates a fully-rounded knowledge of basic principles of household cleaning, laundry, food preparation and service, safety, child care and care of the elderly. Much attention will be given to personal matters such as grooming, health and cleanliness. Many programs will offer post-graduate training for people wishing to become specialists.

The training itself will be a combination of professionally conducted classroom instruction and on-the-job experience under the supervision of competent household employers.

In addition to their own staff specialists, these groups will have the cooperation of vocational and adult education departments of public schools, Extension Service home economists, private agencies such as the Red Cross, the American Nursing Association and the state employment services.

Vital to the success of such programs is the assistance of advisory committees comprised of community leaders in recruiting trainees, seeking out understanding employers and developing public education programs.

Such training programs can be funded under the Manpower Development and Training Act of 1962 which, as amended, provides for training for the vital function of matching the shortage of trained personnel in many occupations with the urgent need for better job opportunities on the part of those suffering from unemployment or underemployment.

Interested parties can write to the National Committee on Household Employment to obtain guidelines for preparing proposals for such projects.

THE SUNDAY STAR
Washington, D. C., July 17, 1966

Housewives Start Small Business

By RUTH DEAN
Star Staff Writer

Ever wish when you got home from work at night that some genie had been there to wash the breakfast dishes and pick up the place?

Has the thought of an untidy apartment kept you from extending that spur-of-the-moment invite to drop in for a minute?

Or panicked you, if you're the other half of a working couple, when hubby called to say there'll be company for dinner?

Fortunately for some lucky area apartment dwellers this nightmare no longer threatens their pursuit of happiness. A genie has really come to their house to stay—five days a week.

This "genie" is a new kind of domestic help business called Maid-a-Day, which its owners label "daily apartment grooming service."

It was organized a year and a half ago by two local housewives, Mrs. Alice Ann Halverson, a former Kansas City secretary, and Mrs. Yvonne Hess, a former Washington Star reporter.

So far as both know, it is the only venture of its kind—not in the United States; there are a few others—but in the Washington area, and one that the Small Business Administration had faith enough in to grant them a loan when quick expansion all but threatened to swamp them before they'd gotten started.

Two To Start

They began with two maids—their own—and now have 17. The maids work in pairs, one pair each to an apartment house. Because they must have enough work to keep the maids busy eight hours a day, five days a week, the service is limited to apartment houses where Maid-a-Day has established itself.

A pair of maids can cover 15 or 16 apartments in a day, doing such light housekeeping as bed making, tidying up the kitchen, dusting and vacuuming. They do no heavy work.

The client pays a flat weekly fee, varying from $12 for an efficiency to $18 for a three-bedroom apartment. The fee eliminates a stack of worries for the client too, for it includes carfare, social security with Medicare and Federal withholding taxes, for which Maid-a-Day assumes full bookkeeping responsibility and payment. Each maid earns a weekly minimum of $55, paid by the service.

Jokingly identifying themselves, Alice Ann said "I'm the chief cook, bottle washer and bookkeeper and Yvonne the chief chauffeur." They both know the business so well, however, either can take over in an emergency.

They laughed when asked "what is a typical day?" For they run the business with one hand, and keep the home fires burning with the other. Alice has four children, Yvonne two, and both have understanding husbands who approve their venture.

They manage the business from home. This includes answering a phone that rings day and night. "We get them as early as 6 a.m.—both clients and maids," said Alice. "And as late as 11 p.m.," added Yvonne.

Home Training

They also do all the interviewing and training at home. Most of their new help is either a relative or friend of the original two. Often "the girls are more particular than we are," reveals Alice in speaking of a perfectionist or two they have in the ranks.

One candidate they were going to turn down "because she was so slow," said Yvonne, "so we paired her with a fast one. Now everytime we see her, she's running."

Maids who pass the Halverson-Hess training course are issued a portable vacuum, yellow uniform and work basket supplied by the service and are assigned to an apartment house and a working partner.

Most Maid-a-Day clients are bachelors, career women and working couples. Once though they got some clients who didn't quite measure up. Most of the maids expect to find things a little messier on Monday mornings, but weren't prepared for what they saw in an apartment shared by three traveling salesmen.

As Mrs. Hess recounted it: "They must have had a fight with a feather pillow. The feathers were all over the place. The TV set was broken in half, and it looked like they'd used chair arms for clubs."

Mrs. Halverson said her husband was so concerned on hearing this, he told her the maids should be escorted into the apartment, "but that he didn't want me escorting them, and couldn't take time from work to escort me."

Another time, in the early days of the business, the two partners got a nasty letter from a client charging the maids had watered her Scotch. "We knew this couldn't be true because as many apartments as the girls have to do they can't afford to get loopy," Mrs. Halverson said.

Selling the Service

"So we wrote her and said we would make a thorough investigation," Mrs. Hess added. "The next day she resumed the service and said it was her brother who'd done away with the Scotch."

The two housewives find that "selling" their maid service merits to new subscribers is the most difficult part of the job. "We have a hard time convincing people these aren't girls who'll come in and smoke cigarettes, watch TV and drink cokes," said Mrs. Halverson.

But the toughest question of all to answer, both agreed, is "the first question clients ask, 'Are you bonded?'"

The Maid-a-Day owners have to answer in the negative, not because they aren't insured (only for accident and property damage) but because no insurance against theft is available to them. "It's lost us several would-be customers," said Mrs. Hess.

So they hope that word of their maids' reputation for honesty will get around and be its own kind of insurance, such as the time a male client left a wallet containing $1,500 in cash lying on his bed. The maid found it and placed it neatly on the bureau. When he came home and found it intact, "he told us she was the most honest person who'd ever worked for him and gave her a substantial tip," said Mrs. Hess.

Sometimes the going gets rough if several of their employes are out sick or clients on vacation decimate the number of workable apartments, so the two women have to do some elaborate shifting of operations from building to building.

However, both reflect "just the experience itself has been worth all the headaches and 24-hour work days."

IV. COMMUNITY RESOURCES

FOR TRAINING, PLACEMENT AND JOB DEVELOPMENT

There are many professional persons in your community who can be enlisted as volunteers to assist with all phases of a household workers program.

TRAINING PROGRAMS:

Cleaning, laundry and home management — County Extension Home Economists, home economics teachers, home service departments of local utility companies, local members of Home Economists in Homemaking and Home Economists in Business sections of the American Home Economics Association.

Food preparation and service — Home economists listed above, school and hospital dieticians, nutritionists with health and welfare departments, headwaiter in outstanding restaurant, china or silver buyer in department store or specialty shop.

Child care and care of the elderly — Home economists listed above, Public Health Nurse, pediatrician or pediatric nurse, geriatric nurse or physician.

Home health care — Public Health Nurse, American Red Cross home nursing instructor, American Nurses Association.

First aid and emergencies — American Red Cross, county sheriff, Office of Civil Defense, local police and fire departments.

Simple repair of home equipment — High school industrial arts instructor, appliance repairman, or local handyman.

Gardening and yard care — County Agriculture Extension Agent, nurseryman, landscape architect.

Social development — Psychologist or psychiatrist, social worker.

Meeting the public — Representative of telephone company.

Grooming — Beautician, voice and dance instructors, department store fashion coordinator, charm school.

Personal money management — Credit union manager, reliable insurance agent, County Extension Home Economist, home economics and economics high school teachers.

PLACEMENT AND COUNSELING:

State Employment Service and qualified licensed private employment agencies, social workers, psychiatrists, psychologists, and clergymen.

V. RECRUITMENT TECHNIQUES FOR HOUSEHOLD WORKER TRAINING

- Referral from placement units of local employment service office.
- Television spot announcements using slides.
- Radio spot announcements.
- Personal appearances at women's clubs, service clubs, churches, social organizations, community associations.
- Information circulated in government agencies.
- Newspaper announcements — neighborhood and city-wide.
- Direct mailing of handbills to addresses in low-income neighborhoods and to names on file in State Employment Service office.
- Posters in coin-operated laundries, city buses, churches, grocery stores, beauty and barber shops, waiting rooms of clinics, stations and other places where people gather.
- Temporary employment offices set up in strategic locations, announced by posters and handbills.
- Referrals from training course graduates.

VI. SUGGESTED TOPICS FOR GROUP DISCUSSION AND STUDY

An important step in changing attitudes toward household employment as an occupation is discussion. Objective discussion can bring into the open feelings held by group members and the reasons for these feelings. This is one part of the Community Committee's responsibility — changing attitudes. With aggressive leadership, the members can come away more aware of the possibilities for raising the status and performance in household occupations and ready to help influence those with whom they come in contact outside their organizations. The following are some ideas for group discussion and study.

A. INTERVIEWING A PROSPECTIVE EMPLOYEE

Essential points for the Employer:

1. The preparation the employee has had for the work to be done.
2. References — what type of work was involved and length of service.
3. Health Certificate — who pays?
4. Attitude toward children, if there are children in the family, and previous experience with child care.
5. Salary and fringe benefits.
6. Personal cleaniness and grooming.
7. Worker's family responsibilities.

Points which the Worker will want to have clear:

1. Size of family and house.
2. Detailed information concerning duties and schedule of work.
3. Patterns of living — employment of family members, participation in community affairs, entertaining, vacations and religious observances to be considered.
4. Hours of work and pay.
5. Whether the job is temporary or permanent and the possibility of "lay offs" during employers' vacation.
6. Available transportation and how the cost is to be met.
7. Possibilities of salary increases.
8. Dates of wage payments.

B. A "DO-IT-YOURSELF" TIME STUDY OF HOUSEHOLD ACTIVITIES

The management of the home, as of any complex organization, is a highly scientific matter. Most of us treat the myriad household tasks as something to be done day in and out with little or no regard for the time consumed or possible ways of reducing this time. Dissatisfaction with the amount of work accomplished by a household employee, frequently expressed by employers, often stems from a misunderstanding of the requirements of the task both in time and energy.

What better way could there be to establish realistic work expectations than for an employer to conduct systematic time studies of each household task scheduled for the worker? Community organizations could set up among their members this "do-it-yourself" time study. All members could participate, if interested, or a committee could be selected to carry out the research and report their findings to the membership.

On the next page is a suggested work sheet for a time study. It includes some household tasks that a worker might be expected to do. Since each household has different requirements, the participants in the study should add those tasks peculiar to the household studied.

Once a realistic time is established for the completion of household tasks, the employer must decide how often these tasks need to be done and whether they are jobs that can be finished by the employee during her time at work. Perhaps members of the family need to take over some of the jobs. Or possibly the equipment or methods are not adequate to do the work in the shortest time. Once the employer begins to approach the management of her home in a scientific manner, she will find that many jobs can be eliminated or combined. Family behavior can even be modified to prevent some recurring tasks. What are these? Each individual who takes part in the time study will discover them for herself. When the experiences with the study are shared in a group meeting, the result should be household employers who are conscious of the real time demands of housework and thus are better able to obtain satisfactory performance from household employees.

WORK SHEET FOR TIME STUDY OF HOUSEHOLD ACTIVITIES

TASK, as required of household worker	Time Started	Time Completed	Total Time	Daily	Weekly	Once every 2 weeks	Once a month
General pick up of living area							
Emptying waste baskets							
Cleaning living room & dining room							
Cleaning bed room 1) 2) 3) 4)							
Changing a bed							
Cleaning bathroom 1) 2) 3)							
Cleaning kitchen sink & counters							
Cleaning surface units on range							
Cleaning oven							
Defrosting and/or cleaning refrigerator							
Loading dishwasher - unloading							
Hand washing and putting away dishes							
Other after-meal cleanup							
Washing venetian blinds							
Special polishing jobs 1) Silver 2) Copper 3) Brass 4) etc.							
Washing inside of windows 1) Living room 2) Dining room 3) Kitchen 4) etc.							
Ironing an average load							
Sorting and loading laundry for washer							
Sorting and folding clothes from dryer							
Child care							
Interruptions: Telephone calls Answering the door							
Other:

a drawer of the buffet			
Washing and replacing a Venetian blind			
Dusting a shelf of books			
Removing from closets and Storing seasonal clothes			
Preparing and arranging a tray of canapes			
Baking and frosting a cake			
Preparing a casserole for the freezer			
Setting up a tray for coffee service			
Preparing a molded salad			
Other:			

C. USING MANAGEMENT TECHNIQUES IN HOME MAINTENANCE

The self-image of the average homemaker is not that of a manager. Although many homemakers are managing the family checkbook and doing that well, other forms of management so necessary to a business enterprise are rarely found in the home. We generally agree that the central purpose of the home is to provide maximum support and enrichment and to release the potential of all members of the family. Because the homemaker has the major responsibility for the operation of this important enterprise, there are areas of management even more basic than those thought of as "home management" which community groups could consider as discussion topics.

The following outline presents some areas of concern to members of community committees considering the management problems of household employment:

I. When Is Household Help Needed?

Each person in our society has a contribution to make. Where can each help to his fullest capacity?

A. The working woman needs help with home duties because she:
   1. Is sole support of a family.
   2. Is contributing to family income because of need.
   3. Has a skill in great demand in labor force.
   4. Is enjoying the opportunity for personal fulfillment.

B. The growing family needs help to:
   1. Release the homemaker to spend irreplaceable time with family members.
   2. Provide skilled care of home that homemaker is not able to accomplish.

C. Community service — Household help allows the homemaker to:
   1. Contribute her skills to the well-being of all families in the community.
   2. Express herself in creative activity for her growth and the ultimate betterment of her own family.

D. The later years — Help is needed because of:
   1. Reduced physical ability to care for home.
   2. Need for companionship or supervision.

E. Special problems of families — Help is needed for the:
   1. Elderly in the home.
   2. Handicapped in the home.

II. Economic Consideration of Employing Household Workers

A. Costs
   1. Is minimum wage adequate pay for worker's needs?
   2. Comparison with costs of services performed outside home:
      a. Laundry
      b. Food Service
      c. Day care

3. Willingness to pay for other personal service, such as beauty parlor, dry cleaning, clothing alterations.

B. Value of the time released
1. To family.
2. To community.
3. To employer — measured monetarily.

C. Improved maintenance of a major capitol investment — the home.

III. Personnel Practices of Employers for Maximum Productivity

A. View worker as in business enterprise with needs for:
1. Good working conditions, wages, hours & fringe benefits;
2. Adequate equipment and supplies with which to work;
3. Appreciation, comfort and attractive surroundings;
4. Time to complete tasks at own pace, within reason;
5. Adequate supervision;
6. Privacy and dignity. Employer-employee rather than Lady Bountiful-needy family relationship.

B. Determine worker's skills and interests.

C. Balance day's assignments to combine satisfying jobs with less attractive jobs.

IDEAS FOR DISCUSSION STARTERS:

Problem: "I can't finish the housekeeping jobs I'm assigned because of the time it takes to care for the children."

Possible Solution: With adequate day care facilities, working mothers can place children with others under trained, creative leaders in a situation that allows for the child's maximum growth and development. The household employee is able to complete those jobs she is especially trained to do well.

Does your community have adequate day care facilities? What other solutions can you think of?

Problem: "I like to do housework, but I hate to work by myself. I think I'll get a job in a hospital where there will be others around."

Possible Solution: Teams of household workers, each with particular skills, can be assigned to work together. The work is completed in shorter time, or two jobs such as cleaning and ironing can be done in one day.

What are your ideas for relieving the loneliness of household work?

Problem: "The job is tiresome, I do the same thing every week. I never feel that I've finished anything."

Possible Solution: Once the employer determines what jobs can be done in small blocks of time; those extra tasks of cleaning the linen closet or kitchen drawers can be sandwiched between regular jobs. This relieves monotony and allows the extras to be taken care of that never seem to get done.

What are your ideas for relieving the monotony of housework, and giving the employee the pleasure and satisfaction of having accomplished a job?

D. A CODE OF STANDARDS RECOMMENDED BY NCHE*

The importance and dignity of household employment will be raised to desirable levels when wages, hours, and working conditions as well as educational and training opportunities are in line with those in other fields of employment requiring skill and ability. Work toward adequate employment standards is a first essential.

1. WAGES

A. The minimum wage should be no less than $1.25 per hour.

B. Higher rates should be paid in line with the training and skill required for the job.

C. Specific day upon which wages are paid is agreed upon in advance.

D. Gifts or clothing are not considered as part of payment.

2. HOURS

Living-out workers:

A. For day workers the number of hours after which overtime is to be paid should be eight hours per day.

B. For full-time workers, i.e., workers employed on a full-time weekly basis by a single employer, the hours above eight hours a day and 40 hours per week should be paid at one and one-half the regular hourly rate. Hours worked in excess of 48 hours per week should be at double the regular hourly rate.

C. The minimum number of hours for which a part-time employee should be engaged should be four with the exception of shared services in the same neighborhood which require little or no travel time.

Living-in workers:

A. The hours on duty above 44 should be paid at one and one-half times the regular hourly rate. Hours on duty in any one week in excess of 52 should be paid for at double the regularly hourly rate.**

---

* The following was adopted by the National Committee on Household Employment on November 10, 1966, as a basis for discussion by local committees and can be amended as needed to fit the prevailing needs of a community. The NCHE is anxious to have the comments and suggested revisions of local groups.

** A differentiation in total number of weekly hours for living-in and living-out workers has been made on the basis that the former spends no time in getting to and from the place of employment.

67

Discussion and Study Topic

3. VACATIONS

Living-out workers:

A. For day workers there should be one day of paid leave for each six months period worked. This should be based on the number of days per week that she has worked for each of her employers.

B. For full-time workers two weeks paid vacation after one year's service.

Living-in workers:

A. Two weeks paid vacation after one year's service.

For longer service in all of the above categories, there should be escalation of leave time.

4. HOLIDAYS

Holidays should be discussed fully and agreed upon in advance.

Living-out workers:

A. For a day worker it is recommended that bonuses should be paid for any one of five designated national holidays on which she works.

B. For full-time workers the equivalent of five national holidays should be given with pay.

Living-in workers:

A. The equivalent of five national holidays should be given with pay.

5. SICK LEAVE

Living-out workers:

A. For day workers, provision for sick leave should be agreed upon at the time of employment.

B. For full-time workers, leave should be based on a minimum of five days a year after one year's service and cumulative for longer service.

Living-in workers:

A. Leave should be based on a minimum of five days a year after one year's service and cumulative for longer service.

6. SOCIAL SECURITY

Earnings should be reported and paid in accordance with the law for Social Security credit toward old age, survivors and disability insurance and records of payment furnished annually to the employee as required in the Social Security legislation.

7. INSURANCE

A. Liability insurance should be carried by employers to protect workers in case of accident.

B. Wherever state laws permit, employers should bring themselves under the jurisdiction of their state workmen's compensation and unemployment compensation laws. (Lists to be furnished by the Women's Bureau.)

8. CHANGES IN SCHEDULES FOR DAY WORKERS

A. If an employer does not require the services of a day worker for the agreed upon time or times, she should give a week's notice to the employee. In lieu of this, the employer should compensate the employee in full.

B. The employee has the responsibility to notify the employer of her inability to report for work.

C. Other changes in schedule for agreed upon working hours and days should be determined by mutual consent.

DUTIES AND WORKING RELATIONSHIPS

1. Duties of position should be clearly defined including specific tasks, frequency and desired standards.
2. Reasonable directions and explanations of duties or tasks should be provided by employer and discussed with the employee so that she can carry them out effectively.
3. Adequate provisions for maximum safety and health should be maintained at all times.
4. Efficient, safe and workable appliances and cleaning aids should be provided and used carefully.
5. Promptness, integrity and courtesy should be observed by both parties.
6. Constructive and helpful evaluation of work should be encouraged.
7. Rest periods, meal times, telephone privileges and time off for church should be agreed upon in advance of employment.
8. Adequate private living quarters should be provided for live-in employment.
9. Work and work relationships should be periodically discussed with the purpose of improving efficiency and understanding. Both parties should work toward competency and good working conditions.

E. SUGGESTED RESOLUTION

WHEREAS, the earnings of the 2.5 million women now employed in the field of household and related services are in most cases below the poverty level, and

WHEREAS, the sole legislative protection afforded them is Social Security coverage, and

WHEREAS, we recognize that they do not, in the main, receive paid vacations and holidays, sick leave, hospitalization, and other fringe benefits common to other occupations and

WHEREAS, these conditions have contributed to an acute shortage of employees in this occupation which is of vital importance to the American home

BE IT RESOLVED: That we, the _____ undertake a program of study and action to:

1. Stimulate the development of training programs to upgrade skills.
2. Work actively for the inclusion of household workers in minimum wage laws.
3. Endorse the Code of Standards recommended by the National Committee on Household Employment.
4. Develop employer orientation and education programs.
5. Enlist the support of other community agencies to further these resolutions.

F. LEGISLATION AFFECTING THE OCCUPATION

It is recommended that Community Committees study and become thoroughly familiar with existing legislation affecting household and related service workers.

Commercial and industrial interests, labor unions, ethnic and racial groups, professional organizations, citizens' groups, agencies of the Federal, state and local governments — all, from time to time, and some continually, attempt to contact Congress and state legislative bodies in order to initiate or to influence the outcome of legislation.

The most effective methods utilized today are basically the same as those used in the past. These include:

1. Carrying on "grass roots" information and educational campaigns designed to mold public opinion and to create a general climate of opinion in which favored legislation would have a chance of enactment.

2. Urging citizens to write their Federal and state legislative representatives in support of or opposition to a particular policy or bill.

3. Making direct contacts with legislative bodies through letters, testimony before Congressional and state committees and public statements of group position on legislation. These presentations to legislators, publicly or privately, verbally or in writing, and by officers of an organization or individuals can be of several types:

   (a) A group can simply state its position on an issue and explain why it wants a certain measure passed or defeated.

   (b) The group can present an elaborate, carefully researched factual analysis and argument.

   (c) The group can choose a personal friend or long-time associate to approach the legislator for purposes of influence.

VII. AN OUTLINE FOR PUBLICITY PROGRAMS

1. Object of publicity:

   To inform the public about household employment as an occupation and the need to improve working conditions and its importance and dignity.

2. Who is to be reached:

   a. Employees and Employers

   b. Groups:

      (1) Civic groups of all kinds

      (2) Churches

      (3) General public

3. Methods of publicity:

   a. Letters

   b. Telephone calls

   c. Posters in public gathering places

   d. Radio and TV public service announcements and special programs

   e. Feature articles in newspapers and magazines

   f. Speeches:

      (1) Know your subject
      (2) Meet issues squarely
      (3) Anticipate questions to be asked and arguments to be presented
      (4) Points to discuss:
          Existing conditions in the field of household employment,
          Better standards — better workers.

For a PUBLICITY HANDBOOK write, giving your name, address, and the name of your group, to:

The Sperry and Hutchinson Company
Consumer Information Service
4242 West 42nd Place
Chicago 32, Illinois

VIII. GUIDELINES FOR A SURVEY TO DETERMINE EXISTING WORKING CONDITIONS, DEMAND FOR WORKERS, EMPLOYEE ATTITUDES

A community survey of the household services occupation will bring forth information on: the requirements of employers, including conditions of work, wages, hours of work and fringe benefits; problems of workers, such as transportation and day care for their children; training needs; and many other factors which affect the attitudes of both employees and employers toward this occupation.

Suggested questionnaires and techniques have been developed after experience with a similar survey in 37 communities. However, any group that decides to set up a survey will undoubtedly wish to ask other questions and phrase them in other ways according to the specific local objectives and the customs of the communities. Interested persons may write to NCHE for sample questionnaires.

The following suggestions may be of help in planning for the survey:

1. Both employees and employers must be assured that they are in no way identified and that their responses are confidential.

2. People who are participating in the survey are generally more cooperative if they know that you are asking their help in raising the status of an occupation which will eventually result in a larger supply of skilled workers; they seem interested in knowing this is a national movement and that through them, their community is participating in it.

3. Most employers will not require help in filling out the form. However, in many cases better results came from having the employers complete them as a group during a regular club or study group meeting. This also gives an opportunity to present some of the reasons why this occupation must be reconstituted.

4. Many employees will need help in filling out the form. Individual interviews are the best way to get employee response. Very few are returned if workers take them home to do.

5. While it is desirable that the forms be filled in completely, it is anticipated that some workers may not wish to answer all the questions. They should be encouraged to answer as many questions as they wish and to skip those they do not want to answer.

HISTORICAL HIGHLIGHTS

"There is nothing new under the sun. That includes the servant problem and the old-as-the-hills truth that a housewife must do the best she can with what she has, even if she has only two arms and two hands instead of the necessary four." This was written in 1869 by Catherine and Harriet Beecher, but for all practical purposes it might as well be 1966.

Dating back to colonial times the problem of getting household workers in New England was always acute, but particularly so during the decades in the middle of the 19th century when the industrial revolution swept forward and women by the thousands left the restrictive life of domestic service to labor in a new freedom in factories.

The old system under which families interchanged sons and daughters "to help out" had broken down long before the Civil War. Few native New England farm girls were willing to hire out in domestic jobs. Housewives who had daughters were particularly handicapped. Virtually all girls who were willing to enter domestic service refused to work in homes where daughters of the family could humble them by "putting on airs."

The great exception to a historic shortage of domestic workers in the United States came at the turn of the century with mass immigration. In 1900 in Eastern Coastal cities, it was customary to find three or four columns of Situation Wanted ads in which girls were applying for jobs as domestics. Young, strong and eager to become a part of America, these girls were available at an average of $20.00 a month. They worked long hours with low wages with little or no objection and were apparently not the least bit bothered by the lack of status in their occupation.

Historical Highlights (Continued):

In 1930 the ebb in immigration had just about stopped the flow of foreign-born servants, and in spite of thousands of unemployed walking the streets during the Great Depression, many people who wanted household help found difficulty in getting it.

In the decade that followed the gap was filled to a limited extent by Negroes, particularly those who were migrating northwards in search of greater freedom and better educational opportunities.

With the coming of World War II and many new opportunities for employment for women, it became apparent that many of the women in household work remain in it only because they had no alternative. In 1940, almost 18 percent of all employed women were household workers; by 1950, the percentage had gone down to 8%.

In 1966 there are only slightly over 2 million women employed in this occupation with the figures constantly decreasing.

The leaflet following, "A Profile of Household Workers in the U.S.A." showing graphically the 1960 Census facts and figures of employees in this field, points up dramatically that this is indeed a disadvantaged occupation. Why should this be a disadvantaged occupation when an acute demand for such services exists in a booming economy such as our Nation enjoys today?

FACTS AND FIGURES ON THE PRIVATE HOUSEHOLD WORKERS OF THE U.S.A.[1]

The facts about this disadvantaged occupation show why it is a matter of priority importance to all concerned with the problems of working women.

ANNUAL WAGES[2]

TOTAL CASH INCOME—including wage and self-employment income as well as all forms of social insurance and public assistance—is very low.

TOTAL CASH INCOME

The low annual wages of all women private household workers reflect the intermittent character of their employment as well as their low rates of pay when employed.

INTERMITTENCY OF THE OCCUPATION
Part Time/Full Time

PRIVATE HOUSEHOLD WORKERS WERE HEADS OF 250,000 FAMILIES

In Two-Thirds of these Families There Were Children Under 18

LEGISLATIVE STATUS—Workers in private household employment are not afforded the protection of the Federal minimum wage and hour law nor of the major forms of social insurance from which most other workers benefit.

DISTRIBUTION OF HOUSEHOLD EMPLOYEES

This is an urban occupation with a predominance of Negro workers.

The average private household worker is about 6 years older than the typical woman in the labor force:

AGE OF WORKERS

MARITAL STATUS OF PRIVATE HOUSEHOLD WORKERS

Educationally, the private household worker is disadvantaged:

EDUCATIONAL ATTAINMENT

WHAT YOU AND YOUR COMMUNITY CAN DO TO BRING LIVING WAGES, A NEW STABILITY AND STATUS TO THIS IMPORTANT OCCUPATION

NATIONAL COMMITTEE ON HOUSEHOLD EMPLOYMENT

HOW TO ORGANIZE A COMMUNITY COMMITTEE

- Contact local units of the national organizations affiliated with NCHE.
- Enlist representatives of other service organizztions, professional associations, women's groups, public and private agencies and the Governor's Commission on the Stau.s of Women.
- Invite household employers and employees to be members of the Committee.
- Invite a local representative of your State Employment Service, Director of Vocational Education, Coordinator of Manpower Programs and the Regional Representative of the Women's Bureau.
- Write to the National Committee on Household Employment for Program and Study Materials.

Discussion and Study Topic

WORKSHOP DISCUSSION GROUPS

A yearly program planning institute conducted by a national organization included a workshop on imaginative approaches to household and related service occupations. The leaders decided that small groups talking about real situations would be more effective in stimulating thought than a formal speech or a panel on the problems of household workers and their employers.

Each small group was given one of the discussion-starters listed below. After talking in small groups, all participants met for a general discussion of each problem. The resulting meeting was lively and provocative. This method was successful in bringing out many of the issues involved in raising the status and improving the working conditions of household workers.

Topics for discussion:

1. I overheard two women talking at the pool the other day. One said, "I guess I'll tell my cleaning woman not to come on Tuesday. The house is in pretty good order and I can use the ten dollars I usually pay her for the day.

   Question: What responsibility does the employer have for the weekly income of the worker?

2. Mrs. S. was telling me how lucky her day worker was to get a bedroom set cheaply. When I asker her what she meant, she replied, "I sold her my old one and just deducted a small amount from her paycheck each week. That won't be a hardship on her."

   Question: What thought has Mrs. S. given to what a few dollars less a week may mean to a person with a low income? What choice did the worker have to refuse the offer to buy the furniture?

3. The worker agreed to spend her afternoon off with the children because her employer wanted to go shopping. The employer promised to be back no later than 5:30 p.m. so that she could catch her bus and go home to her own family. The employer arrived an hour late and offered no apology nor payment for the extra time. It was a rare occasion when the worker could leave at a regular time any day. The worker was responsible for the support of her family of four.

   Question: What is wrong with this situation?

4. One of my neighbors complained, "We bought the dishwasher and an electric floor scrubber so that the cleaning woman would be able to do these jobs easily and have time for other jobs. But she says she doesn't mind doing the dishes by hand and mopping the floors. We think the dishes and floors would be cleaner but she won't try the new equipment."

   Question: What is the employee's responsibility for following directions? Why might she be unwilling to use new equipment?

WORKSHOP DISCUSSION GROUPS (Continued):

5. The employer had planned to deduct Social Security payments as required by law from the wages of her cleaning woman. The worker asked her not to, saying that she would rather have the money in her paycheck. The employer agreed. She didn't think it was fair to burden the worker with the deductions when she needed the money to live on.

   Question: What was the employer's responsibility? How could she have helped her employee to understand the value of Social Security to her?

6. Mrs. L. has worked for the Browns two days a week for 15 years. She also works for two other families. Her income is $50 a week for five days' work. Mrs. L. had an emergency operation and was in the hospital for ten days. She was unable to work for the next three weeks. Public welfare could not give her any financial assistance during this period. Her neighbors helped as much as they could with food and care.

   Question: Did her employers have any responsibility toward her when she was sick? Could this have been planned for in advance?

7. The woman who irons for Mrs. G. dampens the clothes so heavily that it takes her much longer to iron them than would be necessary. By doing this, she is using extra time and electricity.

   Question: What is the employee's responsibility for managing her time and the employer's resources? How could she be helped to understand her responsibility?

8. Mrs. M. discovered that her household worker was spending part of the day watching television and reading women's magazines. She decided to deduct part of the day's wages for this time spent without working.

   Question: Was this the best solution? What other ways are there to solve this problem?

9. A committee of the YWCA met to plan a training program to meet the shortage of household help in the area. When a minimum wage of $1.25 based on Fair Labor Standards was proposed, the reaction was "domestic help is not worth that much," or "you will price them out of jobs; none of us can pay that much."

   Question: What attitudes are being reflected? What new approaches could be made to meet the needs of households and assure incomes for workers in line with today's standards?

National Trucking Industry Apprenticeship Standards for Truck Mechanics; (A Guide for the American Trucking Associations, Inc. and the International Association of Machinists, AFL-CIO).

Manpower Administration (DOL),Washington, D.C. Bureau of Apprenticeship and Training
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 65 45p.

*APPRENTICESHIPS; *MECHANICS (OCCUPATION); *NATIONAL PROGRAMS; *STANDARDS; QUALIFICATIONS; TRADE AND INDUSTRIAL EDUCATION; *PROGRAM ADMINISTRATION

The purpose of these national standards is to serve as a guide for establishing thorough and adequate apprenticeship programs to produce highly trained truck mechanics. It was developed by the Joint Committee of the International Association of Machinists and the American Trucking Associations, Inc. and the United States Department of Labor's Bureau of Apprenticeship and Training. In addition to itemizing the various provisions of the national standards, this booklet includes an explanation of the standards for the guidance of local employers and labor representatives. Among the provisions are those dealing with the selection of applicants for apprenticeship, the appointment of local apprenticeship committees to supervise the training of apprentices, and related instruction requirements of apprentices. Supplementing the provisions are (1) an example of an apprentice recordkeeping form, (2) a schedule of work processes for which to train apprentices, (3) apprenticeship qualifications, (4) an evaluation and rating form, and (5) an explanation of the responsibilities of the apprentices. A directory of regional and state Bureau of Apprenticeship and Training Agencies is included. (HC)

Joint Committee for the Trucking Industry

Gentlemen:

The International Association of Machinists and the American Trucking Associations are to be congratulated on their foresight in adopting standards of apprenticeship to assure adequate training of truck mechanics in the industry.

I feel confident that these standards will serve as an effective guide for the establishment and operation of local apprenticeship programs. Your continued cooperation and enthusiasm will, I am sure, encourage useful programs in the years ahead.

The Bureau of Apprenticeship and Training of the U. S. Department of Labor, which has registered your national standards, stands ready to help your industry at all levels.

Sincerely yours,

Hugh C. Murphy

JOHN M. AKERS
President

September, 1964

To: Trucking Industry Executives

The past few decades have witnessed a vast expansion in the use of the motor truck to transport the Nation's goods. If this growth is to continue a concomitant increase of trained personnel is required. Accordingly, the American Trucking Associations jointly with the International Association of Machinists (AFL-CIO) have embarked on a program for training skilled truck mechanics.

That program is embodied in this national guide containing recommended standards for the apprentice training of truck mechanis. We of ATA believe this program will assure that our valuable motor truck equipment will continue to be maintained at a high peak of safety and efficiency.

I am pleased to note that the national labor-management committee, established to over-see this program, has accepted the vital responsibility of furthering our common goal -- the development of technically qualified journeymen truck mechanics.

I would urge truck operators who have labor agreements with the IAM to partake fully in this constructive labor-management effort. On behalf of the American Trucking Industry, I pledge our efforts to its success.

John M. Akers

John M. Akers, President

INTERNATIONAL PRESIDENT

September 1, 1964

I am pleased to inform you that the International Association of Machinists and the American Trucking Association, Inc., have negotiated A Guide for Apprenticeship Standards for the Trucking Industry. The United States Department of Labor, Bureau of Apprenticeship and Training, assisted in these negotiations.

Management and Labor share the responsibility for the development of Journeymen through sound apprenticeship. Methods and procedures of apprenticeship are those which are agreed upon jointly by Management and Labor through collective bargaining.

This Apprenticeship Manual has been prepared to serve as a guide for all officers and representatives of our Association in any area of our country where we may negotiate apprenticeship agreements with trucking company members of the A. T. A.

Fraternally yours,

A. J. Hayes
INTERNATIONAL PRESIDENT

INTRODUCTION

The purpose of these National Standards is to serve as a guide for the establishment of thorough and adequate apprenticeship programs to produce highly trained truck mechanics to carry on the tradition of craftsmanship in the various branches of the trucking industry, an industry which is increasing in occupational complexity through its dymamic growth.

Management and labor share the responsibility for the development of journeymen through sound apprenticeship. The more effective methods and procedures of apprenticeship are those which are agreed upon jointly by management and labor.

To aid in developing effective programs of training, the American Trucking Associations, Inc., and the International Association of Machinists, AFL–CIO, do hereby recommend that these National Standards be utilized as a guide by management and labor locally to institute joint apprenticeship committees and to develop planned apprenticeship programs designed to meet the needs of the company or companies of the trucking industry.

The minimum requirements and basic procedures to be used in establishing local apprenticeship programs have been set forth.

Authority

The International Association of Machinists and the American Trucking Associations, Inc., have established a joint committee for the trucking industry. They have authorized this committee to act in behalf of the respective organizations on matters pertaining to apprenticeship and training for the industry, which can best be served through a national level approach.

Authority of actions by this committee shall remain within the province of the respective organizations, and shall be executed on the basis of voluntary participation in apprenticeship functions. Authority of the committee, however, shall be considered by all parties participating in formal apprenticeship for the trucking industry, as representative of the industry and as official when pertaining to basic policies.

All functions of the committee shall be on the basis of non-profit endeavor for the good and welfare of apprenticeship and training in the industry, and for the best interest of the apprentice, management, labor and the public.

General Policy

It shall be the policy of the joint committee to promote, develop, improve, and give effect to apprenticeship and training programs for the trucking industry.

The joint committee shall act as a service organization on matters of apprenticeship and training within the industry.

PROVISIONS OF STANDARDS GOVERNING THE EMPLOYMENT AND TRAINING OF APPRENTICES IN THE RESPECTIVE BRANCHES OF THE TRUCKING INDUSTRY[1]

A. Definitions

1. Employer—means any firm by which the apprentice is employed which has contractual relations with the union, either directly or through an association.
2. Association—means the American Trucking Associations, Inc., and affiliated members.
3. Union—means the recognized or certified bargaining agency whether local, district, or Grand Lodge of the International Association of Machinists.
4. Local Committee—means the joint apprenticeship committee representing the union and the employer(s), which shall develop and administer the local apprenticeship program.
5. Apprenticeship Program or Standards—means the document which embodies the procedure for the selection and training of apprentices, setting forth the terms and conditions associated therewith, including wages, hours, conditions of employment, training on the job, and related instruction. The duties and responsibilities, including administrative procedures of the local committee, shall also be set forth in the program or standards.
6. Apprentice—shall mean a person who has signed an apprenticeship agreement with the employer to learn the skill trade outlined in these standards.
7. Apprenticeship Agreement—means the written apprenticeship agreement executed by and between the apprentice and his employer or the employer's agent and approved by the local joint apprenticeship committee. It shall contain the terms and conditions of the apprenticeship. The use of the apprenticeship agreement is for conformance with certain State and Federal laws governing the employment of apprentices, and does not nullify or supersede the bargaining agreement.
8. Registration Agency—as used herein shall mean the Bureau of Apprenticeship and Training, U. S. Department of Labor, or a

[1] Local application of this National Guide in States having State apprenticeship agencies may require adaptation to meet the standards of apprenticeship in such States. The staffs of the Bureau of Apprenticeship and Training and State apprenticeship agencies are available to advise on such standards.

State apprenticeship agency recognized by, and conforming to, the standards established by the Bureau of Apprenticeship and Training.

Composition of Local Joint Apprenticeship Committees

It is recommended that a local joint apprenticeship committee be established, equally representative of management and labor (usually four to six members of equal representation of the union and the employer), and selected (or elected) by the groups they represent.

A joint apprenticeship committee may be established for an individual shop or plant, or on an area-wide basis encompassing the entire jurisdictional area of the local union.

Duties and Functions of Local Committees

The extent of the authority vested in the committee shall be limited to that authorized by the respective participating groups, i.e., the union and the employer.

The joint apprenticeship committee, to the extent authorized, is the administrative body for the local apprenticeship program, and as such shall establish such rules and regulations govering its procedures as may be required.

The committee shall adopt standards of apprenticeship which will enable the apprentice to master the manipulative skills required of the trade, receive related technical instruction, and provide for wages, hours, working conditions, ratios, or any other element that will assure a sound apprenticeship.

The committee shall elect a chairman and a secretary and determine time and place of regular meetings. When the chairman is a representative from the employer, then the secretary should be a representative from the union, and vice versa.

The chairman and secretary shall have authority to vote on all questions.

Among other duties that may arise, the committee shall:

1. Determine the need for apprentices in the shop and/or locality, and the adequacy of available facilities for providing the necessary job experiences;
2. Establish minimum entrance qualifications for apprentices (such as age, education, etc.);
3. Approve apprenticeship agreements;
4. Hear and adjust all differences pertaining to the local apprenticeship program as may be permitted in the standards or the bargaining agreement;
5. Determine the apprentice's progress in manipulative skills and technical knowledge through examination of the records and by oral or written tests which may on occasion be deemed advisable or necessary;

6. Make recommendations for the final determination of the abrogation of apprenticeship agreements;
7. Develop schedules of work experiences which apprentices will receive on the job;
8. Make the necessary arrangements for the apprentice to receive instructions in subjects related to his trade;
9. Be the sole authority to certify that an apprentice has successfully completed his apprenticeship, and recommend the issuance of a Certificate of Completion of Apprenticeship;
10. Maintain such records as they may determine necessary;
11. Be responsible for the successful operation of the apprenticeship program;
12. Provide for registration of the apprenticeship program and any subsequent amendments thereto;
13. Provide for the registration of apprentices with the appropriate registration agency; and
14. Provide for copies of all apprenticeship standards and subsequent amendments to be sent to the headquarters of the International Association of Machinists and the American Trucking Associations, Inc.

Qualifications and Selection for Apprenticeship

It is recommended that local joint apprenticeship committees establish proper standards and procedures under which the selection of apprentices shall be made from qualified applicants on the basis of qualifications alone, without regard to race, creed, color, sex, national origin or occupationally irrelevant physical handicaps, under objective standards which permit review after full and fair opportunity for application.

It is also recommended to the local joint apprenticeship committee that the program be operated on a completely non-discriminatory basis.

Applicants for apprenticeship must be at least 18 years of age and not over 30 years of age. Exceptions may be made for those who are or have been engaged in the trade, because of unusual circumstances, or unusual conditions as determined by the joint apprenticeship committee and for veterans.

It is recommended to the joint apprenticeship committees that they use application forms, aptitude tests, oral interviews, school grades, and previous work records as essential tools in the selection process. When properly used they provide some degree of assurance that the apprentices possess the qualities necessary to succeed in the trade. (See Addendum No. 3 for sample Rating Form)

Term of Apprenticeship

The term of apprenticeship shall be not less than the time defined in the schedule of work processes for the trade listed.

"Overtime" shall be credited on the term of apprenticeship on the basis of actual hours worked.

When the apprentice has had previous experience in the trade, the joint apprenticeship committee may evaluate such experience and recommend credit toward the completion of apprenticeship.

Probationary Period

All apprentices employed in accordance with these standards shall be subject to a probationary period for the first 500 hours of employment. The joint apprenticeship committee may extend this period for good and sufficient cause.

During the probationary period, the agreement may be cancelled at the request of either party by notifying the other. After completion of the probationary period, the agreement may be cancelled by either party for adequate cause. The registration agency shall be notified of all cancellations.

During the probationary period, the local joint apprenticeship committee shall determine the necessary hand tools that the apprentice needs and shall make appropriate arrangements on the manner in which these tools shall be purchased.

Apprenticeship Agreement [1]

The apprentice (and if a minor, his parent or guardian) and the employer or his agent shall sign an apprenticeship agreement, which shall also be approved by the committee. (See Addendum No. 5—sample)

The following shall receive a copy of the approved apprenticeship agreement:

The apprentice
The employer
The union

Ratio

The ratio of apprentices to journeymen shall be in accordance with the collective bargaining agreement.

Wages

It is recommended that during his term of apprenticeship, the apprentice receive a progressively increasing schedule of wages based on a percentage of the journeyman's wage:

Recommended Pattern Increases

1st 500 hours	45% of mechanic rate
2nd 500 hours	50% of mechanic rate
2nd 1000 hours	55% of mechanic rate

[1] Some State apprenticeship agencies require the use of their own apprenticeship agreement forms. In such instances, the agreement forms may be obtained from the staffs of either the State apprenticeship agency or from the Bureau of Apprenticeship and Training.

3rd 1000 hours	60% of mechanic rate
4th 1000 hours	65% of mechanic rate
5th 1000 hours	70% of mechanic rate
6th 1000 hours	75% of mechanic rate
7th 1000 hours	80% of mechanic rate
8th 1000 hours	90% of mechanic rate
After completion of apprenticeship	mechanic rate

Credit for Previous Experience

Apprentices who have been awarded credit for previous experience shall be paid, upon entrance, the wage rate for the period to which such credit advances them.

Hours of Work

The work day and work week for apprentices shall be the same as that of the journeyman.

Apprentices shall be under the direct supervision of a competent journeyman, or supervisor of apprentices at all times.

Related Instruction

A. In compliance with these standards of apprenticeship, each apprentice indentured under these standards shall enroll in and regularly attend approved classes of related instruction for at least 144 hours per year, each year of the apprenticeship. The time spent in such classes (not to exceed 600 hours) shall be credited to the apprenticeship, but such time shall not be considered as hours of work unless the apprentice is required to attend classes during his regular working hours, except as otherwise provided by State law.

B. In case of failure, without good cause, on the part of the apprentice to fulfill his obligations as to class attendance, the committee may suspend or revoke the agreement. The committee shall notify the registration agency of such suspension or revocation.

C. During the term of apprenticeship, the apprentice will receive instruction on the practices of safety.

D. In the event there are no class facilities available, the apprentices shall be required to enroll in a recognized correspondence course approved by the joint apprenticeship committee. In that event, appropriate credit toward completion of apprenticeship for courses completed through correspondence shall be determined by the local joint apprenticeship committee.

Work Processes

During his apprenticeship, the apprentice shall receive such instruction and experience in all branches of the trade as is necessary to develop a practical and versatile craftsman versed in the theory and practice of the chosen branch of the trade. He shall also perform such other duties in the shop and on the job as are commonly related to

such apprenticeship. (See Addendum No. 1 for sample work processes)

Examination of Apprentices

The committee shall examine the work and related instruction records of the apprentice at periodic intervals in order to determine his progress. In the event that any apprentice is not making satisfactory progress, the committee should ascertain the cause and endeavor to correct any deficiencies.

Should the committee believe that due to lack of aptitude and/or attitude the apprentice cannot satisfactorily complete his apprenticeship, then the agreement may be terminated.

Supervision of Apprentices

The employer shall designate a particular person in his shop as the "supervisor of apprentices." He shall be responsible for carrying out the training program as set up by these standards in his shop. Adequate records pertaining to the work experience and related instruction of the apprentice shall be kept by the supervisor of apprentices, and at regular intervals he shall submit reports to the committee. (See Addendum No. 2 for sample records)

Completion of Apprenticeship

Upon successful completion of the apprenticeship under these Standards, the committee shall recommend to the registration agency that the apprentice be issued a Certificate of Completion of Apprenticeship and shall attach its signature thereon. (Samples—Certificate of Completion of Apprenticeship—See Addendum No. 4)

Adjustment of Differences

In the event differences arise regarding the operation or interpretation of the apprenticeship standards, either party may appeal to the committee for the settlement of such differences.

Accident Prevention

Apprentices shall receive instruction in accident prevention and safe working habits during their entire term of apprenticeship. Such instruction shall be coordinated with the actual work being performed on the job and the tools and equipment being used.

Amendment to Standards

The joint apprenticeship committee may amend the apprenticeship standards at any time, subject to approval of the union and the employer(s). All amendments to the apprenticeship standards shall apply to all apprenticeship agreements currently in effect at the time of the adoption of such amendments unless due notice of exception is given in writing to the joint apprenticeship committee by apprentices so affected. Copies of all amendments shall be forwarded to head-

quarters of the International Association of Machinists, American Trucking Associations, Inc., and to the registration agency as defined herein.

Relationship of Apprenticeship Standards to Bargaining Agreement

Apprenticeship standards are a supplement to the bargaining agreement. No part of the apprenticeship standards shall conflict with or supersede the bargaining agreement.

Responsibilities of Apprentices

A. To perform diligently and faithfully the work of the trade and to perform such other pertinent duties as may be assigned by the employer in accordance with the provisions of the local standards.
B. To respect the property of the employer and abide by the working rules and regulations of the employer and the joint committee.
C. To attend regularly and complete satisfactorily the required hours of instruction in subjects related to the trade, as provided under the standards.
D. To develop safe working habits, and conduct himself in his work in such a manner as to assure his own safety and that of his fellow workers.
E. To conduct himself at all times in a creditable, ethical and moral manner, realizing that much time, money and effort will be spent in affording him an opportunity to become a skilled craftsman.

Registration Standards

Before becoming operative, these standards must have the official approval of the employer and union, and be registered with the appropriate registration agency.

OFFICIAL APPROVAL

THE AMERICAN TRUCKING ASSOCIATIONS, INC.

1616 P Street, N. W., Washington, D. C.

Registration Number: 83697

TRUCK MECHANIC

Work Processes (Sample 1)	Approx. Hours
I. *Cleaning and Inspecting the Parts of all Types of Equipment*	500
II. *Cylinder Heads*	750

a. Checking and inspecting heads
b. Replacing valve guides
c. Removing and replacing valve seats
d. Reaming valve guides
e. Grinding valve seats with hand seat grinder
f. Lapping valves
g. Checking valves with dial indicator
h. Installing injector tubes or brass
i. Replacing welch plugs and water test head
j. Rebushing rocker arms and reaming bushings
k. Checking and replacing rocker arm rollers
l. Torquing cylinder head bolts
m. Use of compounds on head gaskets
n. Torquing injectors and adjustment

III. *Cylinder Blocks and Liners*	1,200

a. Removing and installing cylinder sleeves
b. Cleaning and checking water passages
c. Checking counter bores for sleeves
d. Recutting and straightening counter bores
e. Removing and cutting cylinder studs
f. Cleaning ring grooves, fitting piston and ring for clearances
g. Installing piston pin bushing and fitting piston pins
h. Checking rod alignment and rod bores
i. Honing and boring cylinders
j. Cleaning oil passages
k. Inspecting oil and oil lines
l. Checking, removing and installing timing gears
m. Checking main bearing saddles, crank shaft wear and cracks, and radius area
n. Reasons for magnafluxing
o. Installing main and rod bearings
p. Checking oil clearances
q. Torquing main and rod bearings
r. Installing cam shaft bushings and line reaming and bearings
s. Pressure test oil systems
t. Dial indicating run out on fly wheel and housings

	Approx. Hours
IV. *Fuel and Electrical Systems*	1,050
a. Adjusting valve clearances	
b. Installing and adjusting injectors	
c. Checking compression	
d. Checking and adjusting injection and carburetion systems	
e. Care and cleaning of air filters	
f. Timing injection and electrical systems	
g. Use of proper equipment to check electrical systems	
h. Repairing fuel pumps, carburetors, generators and starters	
i. Adjusting voltage regulators	
j. Checking and servicing fuel filtering systems	
k. Making up and installing wiring circuits	
V. *Water Cooling System*	500
a. Checking thermostats	
b. Cleaning water passages	
c. Installing new gaskets on radiator tanks	
d. Checking pressures on cooling systems	
e. Adjusting fan belts and friction driven fan drivers	
VI. *Clutch*	600
a. Checking and adjusting clutches	
b. Rebuilding pressure plates	
c. Relining clutch discs	
d. Removing and repairing clutches	
VII. *Transmission*	1,000
a. Removing and installing transmissions	
b. Testing converters	
c. Rebuilding transmissions and torque converters	
d. Adjusting steering clutches	
e. Rebuilding steering clutches	
f. Relining steering clutch bands	
g. Adjusting and installing ball bearings, Timken bearings, and oil seals	
VIII. *Differentials*	500
a. Adjusting, inspecting and replacing differential gears, bearings, and oil seals	
IX. *Final Drive*	300
a. Removing, replacing and adjusting final drives, axles, gears, bearings, and oil seals	
b. Adjusting tracks, wheel bearings, track rollers and brake lining	
c. Repairing, servicing and adjusting air com-	

	Approx. Hours
pressors, brake applicators, boosters, valves and regulators	
X. *Hydraulic Pumps*	300
a. Repairing and servicing of cylinders, valves and power control units	
XI. *Welding*	800
a. Acetylene—cutting, brazing and welding	
b. Electric—cutting and welding	
XII. *Repair and Maintenance of Self-Propelled and Stationary Equipment Exclusive of Engines*	500
a. Use of proper oils, greases, tools and shop equipment	
b. Maintenance and repair of the various types of equipment used by the industry	
Total	8,000

TRUCK MECHANIC

Work Processes (Sample 2)	Approx. Hours
A. Spring, Frames and Front Axles	500
B. Wheels, Tires and Steering Gears	500
C. Brakes, Rear Axles, and U-Joints	1,000
D. Clutches, Transmissions and Power Take-Offs	1,000
E. Cooling, Lubrication and Fuel Systems	750
F. Engines, including Gas, Diesel and L.P.G.	1,750
G. Electrical Systems	1,000
H. Tune-up and Testing Equipment	500
I. Machine Shop and Welding	500
J. Miscellaneous	500
Total	8,000

TRUCK MECHANIC

Work Processes (Sample 3)	Approx. Hours
A. *Lubrication*	200
Transmission and drive axle	
Replacement and cleaning of all filters and elements	
Final checking—battery and tires	
Steering assembly and connections	
Universal joints	
Clutch bearings	
Water pump and distributor	
Use of various oils and greases	
B. *Front End or Steering*	850
Turning radius and adjustment	

	Approx. Hours
Set toe-in	
Replace wheel oil seals	
Rebuild steer axle	
Check and repair shock absorbers when used	
Replace springs when used	
Replace or repair tie rod ends	
Rebuild or replace spider assemblies	
Rebuild or repair and adjust steering gear	
C. *Drive Axle*	700
Rebuild complete	
Adjust differential bearing	
Rebuild or replace universal joints	
Rebuild or replace axle adaptors	
Rebuild or repair planetaries	
D. *Brakes*	700
Minor adjustments	
Major adjustments	
Bleeding	
Relining brakes or replacing lining	
Replace or turn drums	
Rework or replace backing plate	
Check and repair all connections	
Heel and toe adjustment brake shoes	
Replace or rebuild wheel cylinders	
Replace or rebuild master cylinders	
Check and rebuild or repair power brake system	
Repair or reset or check automatic adjusters	
Repair or replace parking brake mechanism	
E. *Motor Repairs, Overhaul or Install*	1,650
Rebore and hone cylinders	
Repair timing gears and accessory drive gears	
Repair or rebuild hydraulic oil pump	
Grind valves	
Reseat head	
Replace piston rings and pins	
Adjust or replace bearings	
Set timing	
Repair or replace oil pump	
Align rods	
Fit new pistons	
Inspect crankshaft	
Adjust valve	
Engine tune-up	
Repair or replace oil lines	

	Approx. Hours
F. *Cooling System*	450
Knowledge of thorough external cleaning of radiator	
Check and clean transmission oil cooling section of radiator	
Repair water pumps	
Replace hose connections	
Install water pump	
Replace fan	
Minor repair to radiator	
Use of various antifreeze	
Reverse flush block	
G. *Carburetion*	600
Values of dry type air cleaner and oil bath air cleaner	
Correct cleaning methods of both	
Governor repair or rebuild and correct governor functions	
Overhaul	
Adjustment	
Cleaning	
Intake manifold	
Heat riser valve	
H. *Electrical Systems*	950
Test and adjust micro switches	
Correct spring tension in air gap on contactors	
Clean commutator and replace brush springs and brushes on all motors	
Check brush spring tension	
Primary and secondary circuit testing	
Use of instruments—ohmmeter, ammeter, and voltmeter	
Battery—test, charge, replace	
Generator—test, repair, replace	
Turn armature	
Regulators—test, adjust, replace	
Cutouts—test, adjust, replace	
Distributor—overhaul, replace, synchronize	
Starters— overhaul, test, replace	
Lights—switches	
Wiring tests	
Coils, condensers—test and replace	
I. *Engine Tune-Up and Trouble Shooting*	400
Set LPG with combustion efficiency analyzer	
Set LPG with vacuum gage and tachometer	
With analyzers—without	

	Approx. Hours
Distributor adjustment	
Set timing	
Adjust valves	
Test compression	
Test plugs, wires	
J. *Clutch and Transmission*	550
Adjust	
Repair	
Replace	
Inspection of gears, bearings	
Overhaul	
New case installation	
K. *Bench Work*	500
Hydraulic test equipment	
Rebuilding hydraulic cylinders, valves, and power steering accessories	
Operation of various machines	
Valve refacer	
Armature lathe	
Brake drum lathe	
Portable drills	
Boring bars	
Arbor press	
Break testers	
Grinders	
L. *Automatic Transmission*	450
Repair, rework or replace all types of automatic transmissions	
Analyze and test procedures for trouble shooting automatic transmissions	
Function and knowledge of torque converters	
Repair or rebuild industrial type torque converters	
Test and evaluate torque converter functions	
Total	8,000

TRUCK MECHANIC

Work Processes (Sample 4)	Approx. Hours
1. *Electrical*	1,000
Battery, generator, regulator, series-parallel switch, starter, wiring, head lights, body lights, cab and inside lights, turn signals, trailer connections, horn, and engine ignition (coil, condenser, harness, distributor, etc.)	

	Approx. Hours
2. *Fuel*	750
Tanks, lines, fuel pumps, strainers, injector pumps, injectors, and air intake system.	
3. *Cooling*	750
Radiators, hoses, thermostat, radiator shutters, fan and pulleys.	
4. *Lubrication*	500
Oil pump, lines, filters, and pressure fittings.	
5. *Engine*	1,500
Block, heads, crankshaft, rods, pistons, rings, sleeves, bearings, camshaft, valves, valve train, manifolds, pan, blower, turbocharger, exhaust system and muffler, tailpipe, mounts, and gaskets and seals.	
6. *Clutch*	400
Housing, plates, facing, bearings, and linkage.	
7. *Transmission*	500
Housing, gears, shafts, mounts, synchronizers, and control.	
8. *Drive Shaft and Universals*	250
Drive shafts, universal joints and bearings, and hangers.	
9. *Differential*	250
Ring and pinion gears, bearings, reduction gears, and shaft mechanism.	
10. *Rear Axle*	250
Housing, shafts, bearings, and seals.	
11. *Steering*	250
Axle, linkage, steering gear box, shaft and wheel, and power assist mechanism.	
12. *Brakes*	400
Shoes, linings, cylinders, diaphragms, lines, compressor, drums, parking brake shoes, linkage, reservoir, filter, bleeds, drains, controls, pressure switch, and breakaway valve.	
13. *Wheels and Rims*	400
Wheels, lugs, bearings, seals, and rims.	
14. *Accessories*	500
Mirrors, cab cooling and ventilating equipment, windshield wipers, recorder, radios, and heaters.	
15. *Miscellaneous*	300
Service calls, towing, miscellaneous small parts.	
Total	8,000

TRUCK MECHANIC

Work Processes (Sample 5)	Approx. Hours
1. *Lubrication*	200
a. Chassis lubrication	
b. Motor oil change, pack transmission and differential	
c. Pack and adjust wheels and bearings	
2. *Front End Work*	600
a. Repair and install steering parts	
b. Replace springs (coil or leaf)	
c. Replace front axles, king pins and bushings	
3. *Motor Tune-Up*	1,500
a. Install wiring in electrical systems; trouble-shooting	
b. Repair lights, horns, windshield wipers and other electrically operated accessories	
c. Replace generators, starters, voltage regulators and water pumps	
d. Replace fuel pumps, gas and oil gauges, heater gauges, air cleaners and speedometers	
e. Test, adjust and replace spark plugs	
f. Clean, adjust, set and replace distributor parts	
4. *Wheel and Brake Work*	1,000
a. Test brakes	
b. Adjust brakes and fill the lines	
c. Reline brakes	
d. Repair brake (fluid and mechanical) lines and emergency brakes	
5. *Engine Overhaul*	2,500
a. Grind and reface valves	
b. Install piston rings	
c. Replace main and connecting-rod bearings	
d. Replace crankshafts and camshafts	
e. Replace worn gaskets	
f. Replace cylinder block and completely rebuild new engines	
6. *Transmission*	1,000
a. Tear down broken transmission and install new gears, bearings, gaskets, etc.	
b. Build up new transmissions from parts	
7. *Clutch*	600
a. Install new pressure plate	
b. Install new drive member	
c. Install new pilot and throw out bearings	

	Approx. Hours
8. *Rear End Work*	600
a. Repair and replace universal joints	
b. Repair and replace differential	
c. Repair and replace propeller shafts	
d. Install new axle shafts	
e. Install new axle housings	
Total	8,000

TRUCK MECHANIC (HEAVY-DUTY-EQUIPMENT MECHANIC)

Work Processes (Sample 1)	**Approx. Hours**
I. *Engines*	1,500
A. *Gasoline Engine Repair*	
1. Pistons, rings, valves and bearings	
2. Fuel systems—carburetion and fuel pumps	
3. Ignition and starter systems	
4. Lubrication system and oil pumps	
5. Cooling system	
B. *Diesel Engine Repair*	2,500
1. Two-cycle engines	
2. Four-cycle engines	
3. Pistons, rings, valves and bearings	
4. Injection systems	
5. Scavenging systems	
6. Starting systems—electric and compressed air	
7. Cooling systems	
8. Lubricating systems	
C. *Drive Systems*	1,000
1. Clutches	
2. Transmissions and transfer cases and power take-off	
3. Final drives	
4. Rear wheels	
5. Tracks and track suspension systems	
D. *Steering Systems*	
E. *Brake Systems*	
F. *Chassis and Springs*	500
G. *Equipment Repair and Maintenance*	2,000
1. Winches and hoisting gear	
2. Hydraulic and pneumatic systems	
3. Air compressors	
4. Bulldozers, graders, and motor road patrols	

	Approx. Hours
5. Cranes, clamshells and drag-lines	
6. Ditchers and back-hoes	
II. *Lubrication and Lubrication Systems of All Equipment*	500
Total	8,000

TRUCK MECHANIC (HEAVY-DUTY-EQUIPMENT MECHANIC)

Work Processes (Sample 2)	**Approx. Hours**
1. Cleaning and Inspecting the Parts of all Types of Equipment	400
2. Basic Care and Lubrication	250
3. Brakes (all types)	200
4. Clutches	250
5. Transmissions	400
6. Final Drives	350
7. Steering Mechanisms	300
8. Power Control Units	250
9. Winches	100
10. Hydraulic Pumps	250
11. Track Assemblies	150
12. Electrical Systems	300
13. Gasoline Fuel Intake	100
14. Diesel Fuel Injection	250
15. Cooling System	100
16. Engine Maintenance	1,000
17. Engine Reconditioning	1,800
18. Welding	750
19. Field Maintenance, General	800
Total	8,000

TRUCK AND TRAILER BODY MECHANIC

Work Processes (Sample 1)	**Approx. Hours**
I. *Sectional Repairs*	500
a. Replacing square tubing	
b. Reinforcement of sides	
c. Replacement of rear corner posts and covers	
d. Replacement and repair of panels	
e. Replacement of moulding retainer and moulding	
II. *Insulation*	500
a. Knowledge of proper procedure for installing different types of thicknesses	

	Approx. Hour
b. Adapting doors for insulation and weather-stripping	
c. Knowledge of different methods of insulating floors, floor pans, drains, and duck boards	
d. Installation of refrigerator units	
III. *Painting*	1,200
a. Prepare body and fenders for painting	
b. Sanding and rubdown preparation	
c. Use of spray gun	
d. Mix paints	
e. Touch up with brush	
f. Color matching	
g. Air sanding	
h. Masking and taping	
IV. *Sheetmetal Work*	750
a. Bending, forming and applying of body metals	
V. *Woodwork*	1,200
a. General millwork	
b. Planing, joining, ripping	
c. Shiplapping	
d. Carpentry work in connection with body building	
VI. *Blacksmithing*	650
a. Forging	
b. Bending and forming iron	
VII. *Gas and Electric Welding*	700
a. Working with steel, cast iron, sheetmetal and brass	
VIII. *Truck-Body Assembly*	2,500
a. Layout and assembly of all types of truck bodies, as van, semi-van, rack produce, express, etc., and all special type bodies.	
b. Wiring	
c. Mounting bodies	
d. Reading of blueprints	
e. Windshield and glass replacement	
f. Door and door-lock replacement	
g. Canvas work	
Total	8,000

TRUCK AND TRAILER BODY MECHANIC

Work Processes (Sample 2)	Approx. Hours
I. *Body Reconstruction and Assembly*	3,000
Stripping wrecked trucks	

	Approx. Hours
Straightening miscellaneous parts	
Rebuild tail gates, doors, cabs, etc.	
Layout and fabrication	
Riveting	
Installation gas tanks, lines, etc.	
Welding—brazing	
II. *Frame Work*	2,500
Conversion work	
a. Lengthening or shortening frames and drive shafts	
b. Change axle assembly	
c. Install overload springs	
d. Install fifth wheel	
e. Chassis assembly	
f. Repair and straighten frames	
III. *Fabrication of Bodies*	2,000
a. Cabs, partitions, bodies	
IV. *Layout Table and Miscellaneous*	500
Total	8,000

TRUCK AND TRAILER BODY MECHANIC

Work Processes (Sample 3)	Approx. Hours
I. *Machine Work*	1,500
a. Planing—rip saw, band saw, jointer, shaper	
b. Drill press, grinder, nippler, punch press, shear	
II. *Metal Work*	1,500
a. Pitting, bending, lapping	
b. Layout	
c. Welding—electric and acetylene	
d. Soldering	
e. Forge work	
III. *Body Construction*	1,500
a. Layout and fitting	
b. Squaring off, setting and mitering	
c. Build tail-gate	
d. Build and hang doors	
e. Glass installation	
f. Hardware and fittings	
IV. *Chassis*	1,000
a. Layout and fabrication	
b. Riveting, hand and power	
c. Frame alignment	
d. Spring work, coil and elliptic	

	Approx. Hours
V. *Painting*	1,000
a. Priming, filing and sanding	
b. Finishing, exterior and interior	
VI. *Lighting System*	1,000
a. Wiring installation	
b. Head lights, tail lights, parking lights	
c. Spot light, interior lights	
VII. *Insulation*	500
Total	8,000

TRUCK MECHANIC–DIESEL

Work Processes (Sample 1)	**Approx. Hours**
Orientation	500
1. Learning all parts and accessories of diesel engines	
2. Assembling orders for parts	
3. Parts requisitioning and acquiring all knowledge about diesel parts to work hand in hand with diesel mechanic training	
Motor Overhaul	2,500
1. Reboring and honing cylinders	
2. Install crank shaft, pin bearing, camshaft and bushings	
3. Repair oil pump	
4. Adjust fuel racks	
5. Changing and adjusting main and connecting-rod bearings	
Fuel System	2,500
1. Unit injector repair	
2. American Bosch nozzle	
3. Part identification	
4. Calibration and testing	
5. Repairing and lapping pump injector parts	
6. Cleaning and installing fuel line	
7. Assembling and disassembling large fuel pump (A.P.E. Series)	
8. Cleaning and repairing all types of fuel injectors (AKB AKC AKE AKF AKK AKL AKN)	
9. Ordering pump and injector parts	
10. Maintain and operate shop	
Repair to Electrical System	1,250
1. Battery repair and service	
2. Testing, adjusting and installing voltage regulator	

	Approx. Hours
3. Inspect and install wiring	
4. Install and adjust lights	
5. Install electrical accessories	
Repair to Power Transmission	500
1. Clutches-repair and adjustment	
2. Transmission repair	
3. Drive shaft and universal joint	
Repairs to the Cooling System	750
1. Overhaul and install water pump	
2. Install hose, thermostat and fan belt	
3. Repair radiator	
Total	8,000

TRUCK MECHANIC PAINTER

Work Processes (Sample 1)	Approx. Hours
A. Preparing surfaces for painting, sanding, cleaning, papering windows, masking chrome	800
B. Knowledge of paints and thinners, paint and thinner ingredients, handling of paint and thinner inventories, knowledge of paint numbers and charts	600
C. Maintenance and use of painting equipment, brushes, spray guns, spray booths, etc. (including complete assembly and disassembly of spray guns and regulators)	600
D. Matching and mixing of colors for proper tone and quality	600
E. Development technique of painting under varying climatic conditions; surfacing of prime coat, various color coats; operation of spray gun for even distribution	1,200
F. Sanding and rubbing of various coats for completion; stripping of wheels and any other necessary stripping operations	800
G. Detailing of finished product; cleaning up process	800
H. Knowledge of estimating	600
Total	6,000

RELATED INSTRUCTION

Wiring and ignition diagrams with emphasis on schematics
Fundamental hydraulics and Ohm's law
Elementary blueprint reading
Fundamentals of mathematics

Precision measurements
Power transmission
Theory and science related to:
  Carburetion
  Frame and steering
  Rear axle and drive shaft
  Transmission and clutch
Business management
Industrial history and labor problems
Courses in safety
144 hours of related instruction are required for each apprentice for each year.

APPRENTICE RECORDKEEPING

To maintain a current record of the progress and ability of apprentices, an accurate recordkeeping system, covering the pertinent points, is essential. A number of different types of recordkeeping systems are in use in the different areas. Some systems include a variety of recordkeeping forms—daily, weekly, monthly, as well as a final master chart summarizing the pertinent data recorded during the entire term of apprenticeship.

Reproduced on the following pages are a simply designed recordkeeping form and a control report. They are presented as examples in establishing your own recordkeeping system. The recordkeeping form covers a one-month period and is accumulative.

It will be noted that the data recorded during each one-month period is carried forward to the next period. In this way, a current and complete record of the progress of each apprentice may be kept on this single form.

Samples of other recordkeeping systems may be obtained upon request through the field representatives of the Bureau of Apprenticeship and Training or State apprenticeship agencies.

*SERVICE OCCUPATIONS; *EMPLOYMENT OPPORTUNITIES; EMPLOYMENT TRENDS; VOCATIONAL EDUCATION; MANPOWER UTILIZATION; EDUCATIONAL NEEDS; OCCUPATIONAL GUIDANCE; EMPLOYMENT STATISTICS; *EMPLOYMENT PROJECTIONS MISSOURI

The purpose of this study was to compare the possible supply of and demand for selected service workers in Missouri from 1960 through 1970, and to interpret the implications of these findings for the vocational education program of the State. The data were obtained from publications and unpublished documents of federal and state agencies and from previous research relating to the problem. Because there is expected to be a shortage of 83,873 service workers between 1960-1970, especially in food workers, cleaning personnel, and laundry and dry cleaning operations, it is apparent that training programs need to be established and expanded for these occupations. The vast differences between those expected to be trained for an occupation and those expected to enter it, on the basis of past experience, illustrates the need for better guidance and placement services. The vocational guidance and counseling services should be occupationally oriented for the purpose of matching the training of individuals with jobs which are expected to become available. Many unemployed, displaced, and poorly educated persons will have to seek employment in service occupations, and the schools must expand their offerings to adults to enable these people to become gainfully employed in service occupations. This is a summary of a D.Ed. dissertation which was submitted to the University of Missouri. (HC)

PREFACE

One of the fastest growing segments of our labor force is the service occupations. Traditionally, neither vocational educators nor those in apprenticeship training have paid much attention to the educational needs of this group of workers. Thus neglected, service workers have been forced in the main to find jobs without the benefit of proper training and as a consequence have often given unsatisfactory service.

The Area Redevelopment Act and the Manpower Development and Training Act of 1962 are forcing attention of vocational educators and public employment office personnel upon the service worker. Undoubtedly, it is these occupations in which many of our slow-learning youth, high school drop-outs and displaced older persons will find employment. The work done in the service occupations is useful and honorable, and while the training for some service occupations may not be lengthy, it can nevertheless be of high quality and can lend to satisfactory placement and improved personnel and public service.

Recorded here in summary form are the findings of a doctoral study designed to inventory employment opportunities and training facilities and to estimate the employment opportunities and training needs in the service occupations for the decade of the Sixties. The study should be of interest to school counselors, vocational educators, school administrators, public employment office personnel and to employer and employee groups in their effort to select, train, and place youth and adult workers.

Purpose of the Study

It was the purpose of this study to compare the probable supply of, and demand for, selected service workers, enumerated below, in Missouri from 1960 through 1970, and to interpret the implications of these findings for the program of vocational education in the State.

The workers included in this study were selected from the following service occupations and/or occupational groups:

Bakers
Radio and Television Repairmen
Parking Lot Attendants
Shoemakers and Repairmen
Laundry and Dry Cleaning Operatives
Domestic Servants
Barbers and Cosmetologists
Charwomen, Janitors, and Porters
Cooks, except private household
Elevator Operators
Firemen
Guards and Watchmen
Policemen and Detectives
Waiters or Waitresses, Bartenders, and Counter Workers

More specifically the study attempted to answer the following questions:

1. What have been the trends of employment for service workers mentioned above in Missouri from 1940-1960?
2. What has been the age distribution of workers employed in the above mentioned occupations and occupational groups? Do the selected occupations employ predominately older or younger workers? What has been the distribution of all of the selected workers in this respect?
3. How many employment opportunities for service workers will become available in the above mentioned occupations and occupational groups in Missouri during the period from 1960 through 1970?
4. What have been the trends with respect to the number trained as service workers for the above mentioned occupations and occupational groups in Missouri from 1950-1960?
5. How many training opportunities for service workers will become available in the above mentioned occupations and occupational groups from 1960-1970?
6. How will the number of service workers expected to be trained in Missouri compare with the expected employment opportunities for the selected service workers during the decade?
7. What are the implications of these findings for vocational guidance and vocational education in Missouri?

Definition of Terms

The following terms are defined as they will be used in the study:

A "service worker" is one who performs a personal, public, repair, or maintenance service for consumers and/or their commodities.

A "training opportunity" means the opportunity for an individual to enter, and carry through to completion, a training program designed to prepare him to enter a service occupation.

The term "service occupation" is an occupation that requires the worker to perform a personal, public, repair, or maintenance service.

An "employment opportunity" means the opportunity for an individual, who has been trained as a service worker, to obtain employment in that service occupation.

"Labor force" refers to the total level of employment for persons ages 14 through 64, except those serving in the Armed Forces.

"Labor participation rate" is the ratio of the total population in a given age cohort to the total number employed in that cohort.

"Survival rate" refers to the proportion of persons surviving the census interval. The survival rate is the complement of the death rate and was used since it simplified computations.

Sources of Data

Data for the study were obtained from the following sources:

1. Publications of the United States Department of Commerce, Bureau of the Census.
2. Published and unpublished data from the United States Department of Labor, Bureau of Labor Statistics, and Bureau of Employment Security.
3. Published and unpublished data from the Missouri State Department of Employment Security.
4. Publications of the United States Department of Health, Education, and Welfare, Office of Edutation.
5. Published and unpublished data from the State Board for Vocational Education and the Vocational Division of the State Department of Education for Missouri.
6. Published and unpublished data from the Veterans' Education Section of the State Department of Education for Missouri.
7. Published and unpublished data from the Missouri State Board of Cosmetology.
8. Published and unpublished data from previous research.

Procedure for Projecting Employment Data

The projections of employment for service workers in Missouri in the various occupational groups involved the compilation of 1940-1960 employment data for these workers and the identification of trends on which to project the 1970 employment. The projections were computed by multiplying the 1960 employment figures by their ten year per cent change and adding the increase or subtracting the decrease from the 1960 base figure. The employment opportunities for each occupational group were computed as the net difference between

the expected number to be employed in 1970 and those employed in 1960 plus the separation of workers from the labor force.

Employment of Women Service Workers in Missouri, 1960-1970

Data on six occupational groups were collected and projected for women service workers. These groups were: laundry and dry cleaning operatives; domestic servants; barbers and cosmetologists; charwomen, janitors, and porters; cooks; and waitresses, bartenders, and counter workers.

The total employment of women service workers in 1960 was 84,652 and this is expected to increase to 105,437 by 1970, as indicated in Table 1.

The number of women who are to be employed as domestic servants is expected to decrease by about 5,000 during the decade. The anticipated employment for the other women's occupational groups included in the study is expected to increase about, or well over, one-third of the 1960 employment in the occupational groups.

Approximately 47,000 women, or nearly one-half of the expected total employment of women service workers, are expected to be employed as cooks, waitresses, bartenders, and counter workers.

Age Distribution of Women Service Workers, 1960

The age distribution of women service workers in 1960 was computed by multiplying the total number of women service workers in 1960, in the occupation, by the per cent that the age group cell was to the total employment in the occupation in 1950. This procedure, of course, based the 1960 age distribution of women service workers on the 1950 age distribution of these workers.

TABLE I-PROJECTED EMPLOYMENT OF WOMEN SERVICE WORKERS IN MISSOURI FOR 1970

Occupation	Number in 1960	Yearly mean per cent change	Number in 1970
Waitresses, bartenders, and counter workers	19,891	3.207	26,270
Domestic servants	29,778	-1.759	24,544
Cooks	11,869	7.586	20,872
Laundry and dry cleaning operatives	11,299	4.790	15,558
Barbers and cosmetologists	6,980	3.173	9,195
Charwomen, janitors, and porters	4,835	8.610	8,998
Total	84,652		105,437

The age distribution of women service workers shows that the largest number of these workers were in the 35-44 age group and most of the occupational groups had the highest employment in the 35-44 and/or the 45-54 age groups, as indicated in Table II. However, waitresses, bartenders, and counter workers appeared to be younger workers since over one-half of them were 34 and under.

TABLE II-AGE DISTRIBUTION OF WOMEN SERVICE WORKERS IN MISSOURI, 1960

Occupation	Number in Age Group									
	14-19	20-24	25-29	30-34	35-44	45-54	55-59	60-64	65 and over	Total
Domestic servants	2,492	1,751	2,055	2,445	6,289	6,646	2,969	2,537	2,594	29,778
Waitresses, bartenders, and counter workers	3,705	3,270	2,771	2,532	4,213	2,266	573	372	189	19,891
Cooks	178	392	667	917	3,055	3,451	1,532	1,082	595	11,869
Laundry and dry cleaning operatives	534	1,008	1,245	1,251	2,967	2,471	846	553	424	11,299
Barbers and cosmetologists	248	757	987	1,409	2,054	1,062	268	117	78	6,980
Charwomen, janitors, and porters	124	164	203	348	1,040	1,217	681	596	462	4,835
Total in Group	7,281	7,342	7,928	8,902	19,618	17,113	6,869	5,257	4,342	84,652

-7-

Employment Opportunities for Women Service Workers in Missouri, 1960-1970

There are expected to be 62,389 employment opportunities for women service workers from 1960 through 1970, as indicated in Table III. The two occupational groups waitresses, bartenders, and counter workers; and cooks are expected to offer over one-third of the employment opportunities for women service workers during the decade.

TABLE III-EMPLOYMENT OPPORTUNITIES FOR WOMEN SERVICE WORKERS IN MISSOURI, 1960-1970

Occupation	Separations	Increase 1960-1970	Total Employment Opportunities
Waitresses, bartenders, and counter workers	10,373	6,379	16,752
Cooks	5,397	9,003	14,400
Domestic servants	15,138	-5,234	9,904
Laundry and dry cleaning operatives	5,303	4,259	9,562
Charwomen, janitors, and porters	2,421	4,163	6,584
Barbers and cosmetologists	2,972	2,215	5,187
Total	41,604	20,785	62,389

Although the number of women who are expected to be employed as domestic servants shows a decrease over the 1960 employment, this occupational group appears to need 9,904 replacement workers during the decade.

Employment of Men Service Workers in Missouri, 1960-1970

Data on fourteen occupational groups were collected and projected for men service workers. These groups were: bakers; radio and TV repairmen; shoemakers and repairmen; parking lot attendants; laundry and dry cleaning operatives; domestic servants; barbers and cosmetologists; charwomen, janitors, and porters; cooks; elevator operators; firemen; guards and watchmen; policemen; and waiters, bartenders, and counter workers.

A total of 74,212 men were employed in Missouri as service workers in 1960 and 88,468 are expected to be employed in 1970, as indicated in Table IV. The number of radio and TV repairmen is expected to increase from 3,877 employed in 1960 to 11,068 to be employed in 1970. The employment of male service workers in the other occupational groups is expected to experience growth patterns of less than five per cent per year, with the employment of male domestic servants, bakers, cooks, and elevator operators showing a decline.

TABLE IV-PROJECTED EMPLOYMENT OF MEN SERVICE WORKERS IN MISSOURI FOR 1970

Occupation	Number in 1960	Yearly mean per cent change	Number in 1970
Charwomen, janitors and porters	19,507	0.3002	20,093
Parking lot attendants	8,991	3.0380	11,722
Radio and TV repairmen	3,877	18.5490	11,068
Waiters, bartenders, and counter workers	7,612	0.5988	8,068
Laundry and dry cleaning operatives	4,903	4.7900	7,251
Guards and watchmen	6,552	0.6409	6,972

Age Distribution of Men Service Workers, 1960

The age distribution of men service workers in 1960 was computed by multiplying the total number of men service workers in 1960, in the occupation, by the per cent that the age group cell was to the total employment in the occupation in 1950. This procedure, of course, based the 1960 age distribution of men service workers on the 1950 age distribution of these workers.

The age distribution of men service workers shows that, in the main, the groups within the age limits of 30-54 appear to include the largest number of workers, as indicated in Table V. However, there are certain exceptions to this tendency. Over one-half of the parking lot attendants appeared to be under 30 and about one-fourth of the guards and watchmen appeared to be 65 and over.

Employment Opportunities for Men Service Workers in Missouri, 1960-1970

There are expected to be 34,011 employment opportunities for men service workers in Missouri during the 1960-1970 decade, as indicated in Table VI. The occupational group of radio and TV repairmen will apparently offer the greatest number of employment opportunities, 7,540, for men service workers during the decade. The occupational group of charwomen, janitors, and porters appear to be second high with 7,389 expected employment opportunities. Three occupational groups, for male service workers, should have employment opportunities exceeding 3,000; these are: parking lot attendants, laundry and dry cleaning operatives, and guards and watchmen.

TABLE V-AGE DISTRIBUTION OF MEN SERVICE WORKERS IN MISSOURI, 1960

Occupation	Number in Age Group									
	14-19	20-24	25-29	30-34	35-44	45-54	55-59	60-64	65 and over	Total

Employment of Missouri Service Workers, by Sex and Occupation, 1940-1970

Many service occupations employ both men and women workers. However, certain of the occupations included in the study appear to employ predominately one sex or the other. In other occupations, the proportion of men or women workers has changed appreciably. For example, a review of the 1940 through 1960 employment data and the estimates of this study indicate that women were employed in substantial numbers in six of the fourteen occupations included in the study. The remaining eight occupations did not, and probably will not, employ enough women workers to have an appreciable effect on the employment in these occupations. However, with the exception of 1950, women service workers outnumbered men service workers.

In 1940 laundry and dry cleaning operatives were predominately women; by 1970 almost one-third of the workers to be employed in this occupation are expected to be men.

Domestic servants have been and are expected to continue to be predominately women. Both sexes have shown declining numbers, except for women in 1960, and are expected to continue their decline through 1970. Male domestic servants appear to be declining more rapidly than females.

Barbers and cosmetologists experienced a decline in numbers in 1950, as compared with 1940, but showed a rise in employment in 1960 and are expected to continue this trend through 1970. Women workers in these occupations appear to be increasing at a faster rate than men.

Increasing numbers of both sexes are expected to be employed as waitresses or waiters, bartenders, and counter workers, with men representing about one-third of the employment in this occupational group.

The relationships which existed and those that are expected to exist between the sex of service workers and the sex composition of total employment in Missouri are shown in Table VII.

Women service workers constituted 25.42 per cent of the total women employment in 1940 and are expected to constitute about 16 per cent in 1970. This decline, in the main, results from the rise in other employment opportunities for women and a decline in the number of women domestic servants.

In 1940 male service workers constituted 6.60 per cent of the total male employed in Missouri; by 1970 they are expected to constitute 7.30 per cent of the male employed.

TABLE VII-COMPARISON OF SERVICE WORKER EMPLOYMENT TO TOTAL EMPLOYMENT IN MISSOURI, 1940-1970*

Group	Year			
	1940	1950	1960	1970
Women service workers as a per cent of total female employment	25.42	15.59	16.33	16.34
Men service workers as a per cent of total male employment	6.60	6.14	7.04	7.30
Service workers as a per cent of total employment	10.28	8.86	10.10	10.38

*The 1940, 1950, and 1960 per cents are based on Census data, the 1970 per cents are based on the projections of the study.

In 1940, 10.28 per cent of the total workers in the State were service workers. By 1970 service workers are expected to make up 10.38 per cent of Missouri's labor force. However, if the number of service workers to be employed in 1970 are compared with the employment of these workers in 1940 there appears to be a 35 per cent increase in their numbers. When domestic servants are not included in the calculations the number of expected service workers in 1970 will have increased by about 84 per cent over the number employed in 1940.

Procedure for Projecting Training Data

The projection of training opportunities for service workers in Missouri involved the compilation of yearly enrollment figures, from 1950-1960, for students who had been preparing for entrance into service occupations. The projections were computed by multiplying the 1955-1960 base enrollment figures by their expected ten year per cent change.

The anticipated enrollment data were then adjusted to indicate the number of individuals expected to be enrolled, the number of students who may be expected to graduate, and the number of trainees who may be expected to enter the occupation for which they are to be trained.

Projected Enrollment Opportunities for Women Service Workers In Missouri, 1960-1970

The number of women who are expected to be enrolled in training programs for service workers from 1960 through 1970, is indicated in Table VIII. The ten year per cent changes would seem to indicate a substantial change in the number who are expected to be enrolled. However, the number of women who have been enrolled in training programs that trained service workers has not been large and a moderate increase in numbers can often result in a high per cent change for that group.

TABLE VIII-PROJECTED ENROLLMENT OPPORTUNITIES FOR WOMEN SERVICE WORKERS IN MISSOURI, 1960-1970

Training program	Number 1955-1960	10 year per cent change	Number 1960-1970
Cosmetologists (private schools)	8,874	136.66	21,000
Cosmetologists (public schools)	968	108.28	2,016
Food trades	508	76.08	894
Laundry and dry cleaning operatives	116	315.54	482
Domestic servants	14	---	
Charwomen, janitors, and porters	0	00.00	0
Total			24,392

Projected Enrollment Opportunities for Men Service Workers in Missouri, 1960-1970

The number of men who are expected to be enrolled in training programs for service workers from 1960 through 1970 is indicated in Table IX. The ten year per cent changes were based on past enrollments in the enumerated programs. Since the individual programs did not enroll large numbers of students a moderate increase in the number being trained can result in a high per cent change for that group.

Based on these data, male enrollees in training programs for laundry and dry cleaning operatives are expected to experience the greatest change, 334.34 per cent, for the decade. The largest projected increase, in terms of number enrolled, is anticipated in radio and TV repairmen training programs. There are expected to be fewer males enrolled in training programs for charwomen, janitors, and porters, than in any of the other training programs, 227.

Barbers have been, and are expected to continue to be, trained in private schools.

Service Workers Expected to be Trained in Missouri, by Sex and Occupation, 1960-1970

Training programs for service workers prepare both men and women to enter many service occupations. However, certain of the training programs included in the study appear to train predominately one sex or the other.

TABLE IX-PROJECTED ENROLLMENT OPPORTUNITIES FOR MEN SERVICE WORKERS IN MISSOURI, 1960-1970

Training program	Number 1955-1960	10 year per cent change	Number 1960-1970
Radio and TV repairmen	1,331	198.50	3,973
Barbers (private schools)	1,358	140.26	3,263
Food trades	876	189.34	2,535

Charwomen, janitors, and porters	99	130.00	227
Domestic servants	0	00.00	0
Elevator operators	0	00.00	0
Firemen	0	00.00	0
Guards and watchmen	0	00.00	0
Parking lot attendants	0	00.00	0
Policemen and detectives	0	00.00	0
Total			13,369

The number and sex of individuals who may be expected to enroll in each of the training programs for service workers is shown in Table X. Women are expected to be trained in four of the eight training programs included in the study.

Men, it appears, will be enrolled in each of the training programs except cosmetology.

Individuals enrolled in these programs do not all complete the training or graduate. The expected number of graduates from training programs for service workers is indicated in Table XI. Women constitute 59 per cent of the total number expected to graduate from these training programs during the decade.

The expected number to graduate from training programs for service workers constitute the potential number of trained personnel who could enter the various occupations. However, not all of the graduates of such training programs enter the occupation for which they were trained or a closely related occupation. Therefore, a correction to compensate for this factor was attempted which would give an estimate of the probable number of these persons who would subsequently enter the occupation for which they are expected to be trained.

The number of persons who may be expected to enter the occupation for which they are expected to be trained is shown in Table XII.

An estimate of the attrition of individuals from the training programs for service workers may be made by dividing the total number of individuals who are expected to seek training by the expected training completions and the expected trained occupational entries. This procedure indicates the per cent that the expected training completions and the expected trained occupational entries are to the total number of individuals who may be expected to seek training for service occupations during the decade.

TABLE X-EXPECTED ENROLLMENT OF INDIVIDUALS IN SERVICE WORKER TRAINING PROGRAMS, 1960-1970

Training program	Number 1960-1970		
	Men	Women	Total
Cosmetologists (private schools)	0	21,000	21,000

Janitors	186	0	186
Total	7,883	11,310	19,193

TABLE XII-ANTICIPATED OCCUPATIONAL ENTRIES FROM STUDENTS EXPECTED TO GRADUATE FROM TRAINING PROGRAMS FOR SERVICE WORKERS, 1960-1970

Training program	Number 1960-1970		
	Men	Women	Total
Cosmetologists (private schools)	0	7,392	7,392
Barbers (private schools)	1,149	0	1,149
Radio and TV repairmen	1,067	0	1,067
Food trades	725	280	1,005
Laundry and dry cleaning operatives	647	154	801
Cosmetologists	0	760	760
Shoe repairmen	288	0	288
Janitors	65	0	65
Total	3,941	8,586	12,527

These data indicate that about 56 per cent of those who may be expected to seek training for service occupations will complete their training, as illustrated in Figure I.

This appears to be an appreciable reduction of the number who could be trained as service workers. Moreover, when the expected trained occupational entries are compared with the number who are expected to seek training the attrition becomes even greater. In this case, the expected trained occupational entries represent only about 37 per cent of those who are expected to seek training for service occupations during the decade.

It seems apparent that, if only 37 per cent of those who are expected to seek training ultimately become employed in the occupation for which they are to be trained, changes need to be made in the selection and placement practices for students in these programs.

FIGURE I

COMPARISON OF INDIVIDUALS EXPECTED TO BE ENROLLED, EXPECTED TRAINING COMPLETIONS, AND EXPECTED TRAINED OCCUPATIONAL ENTRIES, EXPRESSED AS A PER CENT, FOR SERVICE OCCUPATIONAL TRAINING PROGRAMS IN MISSOURI, 1960-1970

The Imbalance

A comparison of the total number of employment opportunities for service workers with the total number of training opportunities for service workers indicates that there is a great imbalance between the two. There is expected to be a total of 96,400 employment opportunities for service workers in Missouri during the decade, as indicated in Table XIII. To supply this apparent demand there is expected to be a total of only 34,121 individuals seeking training for service occupations and 12,527 of these may be expected to complete their training and enter the occupation for which they are to be trained, leaving an expected shortage of 83,873.

The greatest imbalance between the number who should be trained for a service occupation and the number of employment opportunities, a shortage of 32,569 trained occupational entries, is expected for the food trades.

TABLE XIII-EXPECTED IMBALANCE BETWEEN EMPLOYMENT OPPORTUNITIES AND TRAINING OPPORTUNITIES FOR SERVICE WORKERS IN MISSOURI, 1960-1970

Occupational group	Employment Opportunities	Training Opportunities*	Apparent Imbalance**	Expected Trained Occupational Entries	Expected Imbalance***
Food trades	33,574	3,164	-30,410	1,005	-32,569
Charwomen, janitors, and porters	13,973	215	-13,758	65	-13,908
Laundry and dry cleaning operatives	12,731	2,365	-10,366	801	-11,930
Domestic servants	9,813	0	- 9,813	0	- 9,813
Radio and TV repairmen	7,540	2,304	- 5,236	1,067	- 6,473
Parking lot attendants	3,671	0	- 3,671	0	- 3,671
Guards and watchmen	3,639	0	- 3,639	0	- 3,639
Barbers	2,192	3,263	1,071	1,149	- 1,043
Policemen and detectives	1,605	0	- 1,605	0	- 1,605
Firemen	1,211	0	- 1,211	0	- 1,211
Shoemakers and repairmen	1,015	621	- 394	288	- 727
Elevator operators	249	0	- 249	0	- 249
Cosmetology	5,187	22,189	17,002	8,152	2,965
Total	96,400	34,121		12,527	

*Indicates the maximum number of individuals who could be trained with facilities existing at time of study.

**Represents the difference between training opportunities and employment opportunities. Negative figures denote an undersupply of training opportunities, positive an oversupply.

***Indicates the difference between expected occupational entries and employment opportunities. Negative figures denote an undersupply of trained workers, positive an oversupply.

-17-

There is an expected shortage of over 10,000 needed trained additions to the labor force for two occupational groups: charwomen, janitors, and porters; and laundry and dry cleaning operatives. Two other occupational groups, barbers, and shoemakers and repairmen, are expected to have a shortage of about 1,000 needed trained additions to the labor force for each occupational group. There will be an apparent oversupply of 17,002 training opportunities in cosmetology and 2,965 of the graduates who could be expected to enter this occupation may not be able to find employment due to the apparent oversupply of trained workers for this occupation.

The number of women who may be expected to be trained for those service occupations which employ both sexes appears to be vastly out of line with the expected employment opportunities for women in these occupations. For example, the food trades are expected to offer a total of 33,574 employment opportunities; 31,152 of these are expected for women, but only 280 women who have been trained may be expected to enter these trades. There is expected to be a total of 13,973 employment opportunities for charwomen, janitors, and porters during the decade, 6,584 of these employment opportunities may be expected for women; however, no women are expected to seek training for this occupational group. There is expected to be a total of 12,731 employment opportunities for laundry and dry cleaning operatives and 9,562 of these may be expected for women; however, only 154 women who have been trained may be expected to enter this occupational group.

An estimate of the overall imbalance may be made by dividing the training opportunities by the employment opportunities. This procedure indicates the per cent that the training opportunities and the expected occupational entries are of the employment opportunities. If, in fact, all of those who were to enter the various training programs did complete their training and entered the occupation for which they are to be trained about 35 per cent of the demand for trained service workers would be satisfied, as illustrated in Figure II. However, when corrections are made for drop-outs and occupational non-entries only about 13 per cent of the demand for trained occupational entries for service occupations will be satisfied.

The overall imbalance may also be illustrated by dividing the total employment opportunities by the total training opportunities and, also, the total expected trained occupational entries. This procedure will give an indication of the number of employment opportunities for each training opportunity. If those students who are to seek training completed the training and entered the occupation for which they are to be trained there would be an estimated 2.80 employment opportunities for each training opportunity. However, when corrections are made for drop-outs and occupational non-entries the estimated total imbalance is 7.70 employment opportunities for each trained occupational entry.

While the overall imbalance does give an indication of the training job to be done in Missouri during the decade, it does not reveal the number of employment opportunities for each training opportunity and each expected trained occupational entry. An estimate of this imbalance may be made by dividing the employment opportunities for an occupational group by the training opportuni-

FIGURE II

COMPARISON OF EMPLOYMENT OPPORTUNITIES, TRAINING OPPORTUNITIES, AND EXPECTED TRAINED OCCUPATIONAL ENTRIES, EXPRESSED AS A PER CENT, FOR SERVICE WORKERS IN MISSOURI, 1960-1970

ties for that occupational group and, also, the trained occupational entries. Where there is a surplus of trainees the procedure can be reversed and the resultant figure referred to as a negative number of employment opportunities per training opportunity. The computed ratios are shown in Table XIV.

There are expected to be 65 employment opportunities for each training opportunity for charwomen, janitors, and porters. However, for each trained occupational entry there are expected to be 215 employment opportunities. The vast differences between those expected to be trained for an occupation and those

TABLE XIV-EXPECTED NUMBER OF SERVICE WORKER EMPLOYMENT OPPORTUNITIES FOR EACH EXPECTED TRAINING OPPORTUNITY AND TRAINED OCCUPATIONAL ENTRY IN MISSOURI, 1960-1970

Occupational group	Number of jobs per	
	Training Opportunity	Trained Occupational Entry
Charwomen, janitors, and porters	65.0	215.0
Food trades	10.6	33.4

Cosmetology	-4.3	-1.6

*Negative numbers indicate a surplus of trainees or trained occupational entries.
**Indicates no expected training opportunities.

expected to enter it, on the basis of past experience, illustrates the need for better guidance and placement services in connection with vocational training.

Conclusions

To the extent that the assumptions used in this study are valid and the data collected are reliable, the following conclusions seem warranted:

It is apparent that service workers can look forward to high levels of employment during the 1960-1970 decade.

In view of the fact that the employment in the service occupations is increasing at a relative rapid rate, it is apparent that consumers in Missouri are demanding an increasingly greater number of services.

Since the expected employment opportunities are much greater than the expected trained occupational entries for service occupations in Missouri during the 1960-1970 decade, it is apparent that here is an area of training for which the need is great and that training programs need to be established and expanded for these occupations.

Since it is almost certain that many unemployed, displaced, and poorly educated adults and youth who have marginal ability or who drop out of school will have to seek employment in service occupations, it follows that training for these occupations would provide such people with marketable skills which would be of benefit both to themselves and to society.

It is apparent that school administrators, vocational educators, and vocational counselors have not been aware of or greatly concerned with the training needs for service workers.

Better placement and guidance services are needed in connection with pre-employment training programs for service workers. The Employment Service, employers, school administrators, vocational educators, counselors—society, all of these must share in the responsibility for providing these services.

Recommendations

On the basis of the findings and conclusions of this study the following recommendations are made:

The findings of this study should be used as a basis in establishing and expanding training programs for service workers in Missouri during the 1960-1970 decade.

Vocational guidance and counseling services should be established in Missouri which are occupationally oriented for the purpose of matching the training of individuals with the jobs which are expected to become available. Since many of the service occupations will offer an increasing number of employment opportunities, measures should be taken to more nearly match the assets and liabilities of individuals with the job opportunities in these occupations.

In the future it is almost certain that many unemployed, displaced, and poorly educated persons will have to seek employment in service occupations. If the schools are to contribute substantially to the solution of the manpower problem in Missouri they must expand their offerings to adults and provide quality training, simple though it may be, which would enable these persons to become gainfully employed in service occupations and hence to serve society.

In view of the vast difference between those expected to be trained for an occupation and those expected to enter the occupation, schools should place considerably more emphasis on the placement of people in the occupation for which they have trained them.

The findings of this study should be made available to persons in Missouri who are concerned with the guidance, counseling, training, placement, and employment of persons whose assets and liabilities fit them for employment in service occupations.

*OCCUPATIONAL SURVEYS; *TECHNICAL OCCUPATIONS; *EMPLOYMENT OPPORTUNITIES; EMPLOYMENT TRENDS; EMPLOYMENT PROJECTIONS; EMPLOYMENT STATISTICS; VOCATIONAL EDUCATION; MANPOWER UTILIZATION; EDUCATIONAL NEEDS
MISSOURI

This study was made to compare the probable supply of, and demand for, technicians in Missouri from 1960 through 1970, and to interpret the implications of the findings for the vocational education program of the State. Data were obtained from federal and state agencies and from information forms sent to a sample of industrial firms within the State. Technician employment was expected to continue at a high level and at a faster rate than total employment. Preemployment training was not being provided in many of the technical occupations. Inservice technical training was needed in most industries, but employers expected some of their inservice training needs to be provided by the schools. The imbalance between preemployment technical training programs and the technical occupations was sufficient to warrant expansion of technical curriculums in the public schools. It was recommended that (1) junior colleges devote a considerable portion of their facilities to training industrial and health service technicians, (2) public school guidance, counseling, and placement services, as they relate to the technical occupations, be improved and expanded, and (3) teachers of technical occupations be trained, and (4) a higher percentage of students be enrolled in technical classes each year. This is a summary of a D.Ed. dissertation which was presented to the University of Missouri. (HC)

PREFACE

Technology in America is expanding in all directions, and the need for trained technicians is growing at an even faster rate. In industry and in the health services particularly there is an acute shortage of qualified technicians. It is reported that great numbers of engineers are performing duties that could just as well be assigned to competent technicians, thus alleviating the shortage of professional engineers.

Up and down and across the country new public and private facilities for the training of technicians are being established, and in some places older trade training programs are being converted or upgraded to the technician level. Funds made available under Title VIII of the National Defense Education Act are stimulating the development of area-vocational-technical programs in public schools and junior colleges. As these developments go forward, the question of what technical occupations to prepare people for, and in what numbers, is a paramount one. Facts concerning current and future supply and demand are needed.

This report consists of a summary of the findings, conclusions and recommendations of a doctoral study designed to inventory current employment opportunities and training facilities for technicians in Missouri and to forecast employment opportunities and training needs for these workers up to 1970. It is believed that school administrators and vocational educators will find the report of value in establishing and operating technical training programs. Counselors should find the information helpful in advising with students relative to occupational choice and training. Employment Service personnel, employer and employee groups likewise should find in the report information of interest to them.

Purpose of the Study

The purpose of the study was to compare the probable supply of, and demand for, technicians in Missouri from 1960 through 1970, and to interpret the implications of these findings for the State's program of vocational-technical education. Specifically, the study attempted to answer the following questions:

1. How many employment opportunities for technicians will become available in the State of Missouri from 1960 through 1970?
2. What are the technical training needs in selected Missouri industries? What technical occupations are found in these industries? What conditions exist in these industries that might increase the demand for technical training during the decade?
3. How many training opportunities, training completions and trained occupational entries are expected during the decade? How will each of these compare with the expected employment opportunities for the 1960-1970 period?
4. How do the pre-employment technical training programs offered in the public schools of Missouri and the enrollments therein compare with the various technical occupations in Missouri?
5. What are the implications of these findings for the programs needed in vocational-technical education in the State? What are the implications for vocational guidance?

Definition of Terms

The definitions of the following terms indicate their meanings as used in this study.

A "technical occupation" is an occupation in which most of the worker's duties require the application of technical and scientific knowledge and technical understanding in contrast with manipulative skills. The nature of the occupation places it between that of the professional worker and the skilled worker. The occupation requires knowledge of physical, engineering, mathematical, biological or other natural sciences such as is acquired through programs approved by the Missouri State Board for Vocational Education and approved hospital schools in Missouri. It requires specialized training in the use of instruments, tools and special devices to operate, illustrate, design, maintain, fabricate and test objects, specimens, materials and equipment.

"Technician" refers to a person trained for or employed in a technical occupation.

The term "industrial technicians" refers to technicians employed in the manufacturing and nonmanufacturing industries and agencies included in the study.

The term "health service technicians" refers to technical workers in medical and dental health services.

"Title VIII of The National Defense Education Act of 1958" refers to that section of the act which provides for training of highly skilled technicians in recognized occupations requiring scientific knowledge in fields necessary for national defense.

An "Area vocational school" refers to a public school which serves a designated geographic area and offers several area vocational education programs.

"Vocational-technical education" refers to organized training designed to prepare an individual for entry into a technical occupation.

"Area vocational education program" refers to a public school program provided for under the provisions of Title VIII of the National Defense Education Act of 1958.

"Employment opportunity" means the opportunity for an individual, who is trained as a technician, to obtain employment in a technical occupation.

"Training opportunity" means the opportunity for an individual, to enter, and carry through to completion, a training program designed to prepare him to enter a technical occupation.

The term "maximum yearly completions" is used to designate the maximum number that could complete technical training each year if there were no dropouts.

The term "major industry groups," refers to the industrial groups as defined and classified in the Standard Industrial Classification Manual, 1957, Bureau of the Budget.

The term "registered X-ray technician" refers to employed technicians reported as being registered with the American Society of X-ray Technicians.

The term "registered medical technologists" refers to employed medical laboratory workers reported as being certified by the Registry of Medical Technologists of The American Society of Clinical Pathologists.

The term "nonregistered medical technicians" refers to medical laboratory workers who, because of the limited nature of their training do not qualify for complete certification by the Registry of Medical Technologists.

Source of Data

Data for the study were obtained from: The Missouri Division of Employment Security; National Science Foundation; Bureau of Census; Department of Labor; Missouri State Department of Education; American Medical Association; Missouri Hospital Association; and information forms sent to a sample of industrial firms in the State.

Employment opportunities for industrial technicians were estimated as a ratio of the number of scientists and engineers, which was, in turn, obtained by a percentage of total employment in the industries covered by the study. Employment opportunities for health service technicians, and training opportunities for technicians were ascertained by applying the per cent changes in employment and enrollments during the 1950-1960 period to the 1960-1970 period.

Industries, Agencies, and Services Included in the Study

The selected industries and agencies in which employment opportunities were projected were as follows:

Manufacturing Industries

1. Lumber and wood products

2. Furniture and fixtures
3. Stone, glass and clay products
4. Primary metal products
5. Fabricated metal products
6. Machinery, except electrical
7. Electrical machinery
8. Transportation equipment
9. Instruments and related products
10. Ordnance and miscellaneous manufacturing
11. Food and kindred products
12. Textile mill products
13. Paper and allied products
14. Chemical and allied products
15. Other non-durable goods

Nonmanufacturing industries, agencies, and services

1. Contract construction
2. Architectural and engineering services
3. Mining
4. Miscellaneous business services
5. Transportation, communications, and public utilities
6. State Government agencies
7. Medical and dental health services

Projected Level of Total Employment

On the basis of the 1950-1960 growth pattern in the manufacturing industries in the State of Missouri, employment in manufacturing is expected to be approximately 442,496 by 1970. Employment in the selected nonmanufacturing industries and agencies included in the study is estimated to be approximately 257,575 by 1970. The 1960 employment figure and the projected 1970 figures for the selected industries and agencies are shown in Table I. This represents an overall employment increase of approximately 15 per cent for the 1960-1970 period.

Employment of Scientists and Engineers: 1960 and 1970

Projected increases in employment of scientists and engineers in Missouri's industries were calculated because of their relationship to the employment of industrial technicians. Table II reveals estimates of the number of scientists and engineers employed in 1960 and the number expected by 1970.

The number of scientists and engineers employed in the industries and agencies covered by the study is expected to increase from 19,038 in 1960 to 32,323 by 1970, for an increase of approximately 70 per cent.

TABLE I-TOTAL EMPLOYMENT IN SELECTED INDUSTRIES IN 1960 AND PROJECTED TO 1970

Industry	1960 Employment*	1970 Employment**
Manufacturing	391,600	442,496

*Employment in Engineering and Architectural Services was estimated to be in the same proportion of the labor force of Missouri in 1960 and 1970 as it was for the Nation as a whole.

**Source: National Science Foundation, Scientific and Technical Personnel in State Government Agencies (Washington: Government Printing Office, 1960), pp. 28-43.

Employment of Industrial Technicians: 1960 and 1970

The number of technicians employed in the State of Missouri is expected to increase from 13,466 in 1960 to 22,129 by 1970, an increase of approximately 65 per cent. The transportation equipment group, having the largest employment of the manufacturing industries, showed the highest increase in the estimated number of technicians to be employed by 1970. As revealed in Table III, the number of technicians employed in this group is expected to increase from 2,451 in 1960 to 6,292 by 1970. Ordnance and miscellaneous manufacturing had 324 technicians in 1960; this figure is expected to increase to 778 by 1970. The number of technicians employed in miscellaneous business services is estimated to be 92. This group is expected to increase to 209 by 1970, an increase of 127 per cent.

Figure I graphically illustrates the relationships between the amount of growth expected in total employment, scientific and engineering employment, and technical employment. As indicated, the growth expected in technical employment is more than four times greater than the expected growth in total overall employment for the decade.

FIGURE 1

COMPARISON OF THE PER CENT INCREASE EXPECTED IN TOTAL EMPLOYMENT, SCIENTIFIC AND ENGINEERING EMPLOYMENT AND TECHNICAL EMPLOYMENT 1960 to 1970

Employment Opportunities for Industrial Technicians

Between 1960 and 1970 it is expected that there will be 10,315 employment opportunities for technicians in Missouri, as indicated in Table IV. Six manufacturing industries are expected to provide approximately 70 per cent of the employment opportunities for the decade. These industries and the estimated num-

Instruments and related products	131	31	162
Ordnance and miscellaneous manufacturing	454	40	494
Non-Durable Goods			
Food and kindred products	33	24	57
Textile mill products	- 13	10	- 3
Paper and allied products	143	18	161
Chemical and allied products	542	105	647
Other non-durable goods	11	3	14
Non-manufacturing			2,430
Mining	71	13	84
Contract construction	531	109	640
Transportation, communication and public utilities	305	217	522
Engineering and architectural services	419	180	599
Miscellaneous business services	117	11	128
State Government agencies	307	150	457
Total		1,652	10,315

*Computed from Table III

**Based on a separation rate of 122.6 per thousand employed in 1960.

ber of employment opportunities they are expected to provide are as follows: transportation equipment, 4,142; ordnance and miscellaneous manufacturing, 494; fabricated metal products, 723; electrical machinery, 709; chemical and allied products, 647; and machinery, except electrical, 636. The combined employment opportunities for the decade are expected to be only 135 in the following five industries; lumber and wood products, furniture and fixtures, stone, clay and glass products, food and kindred products and other nondurable goods.

The nonmanufacturing groups are expected to provide slightly less than 25 per cent of the total employment opportunities. The highest *per cent* increase in technician employment during the 1960-1970 period is expected in miscellaneous business services. The number of technicians employed in this group is expected to increase from 92 in 1960 to 209 by 1970, for an increase of 127 per cent.

Difficulty in Obtaining An Adequate Number of Trained Technicians

An indication of the training needs for industrial technicians was ascertained by asking employers if they had experienced any difficulty securing trained technicians for their industries. It was found that industrial employers had experienced some degree of difficulty obtaining trained technicians in 18 technical occupations, as indicated in Table V.

TABLE V-DIFFICULTY IN OBTAINING TRAINED TECHNICIANS

Technical Occupations	Number of Employers Having Difficulty In Finding Trained Technicians*
Drafting	35
Production	22
Sales	21
Inspection	16
Electronics	14
Maintenance	10
Instrumentation	10
Laboratory	10
Chemistry	5
Estimating	2
Tool designing	2
Agricultural	1
Engineering aid	1
Electrical	1
Photography	1
Ceramics	1
Research and development	1
Welding	1

*The figures in this column were not totaled because many employers had experienced some difficulty in finding trained persons in more than one technical occupation and would have been counted more than once.

Sources of Technicians for Missouri Industries

In an effort to gain some insight into the types of persons industry uses in its technical jobs, employers were asked to indicate the sources of supply for their technicians. As revealed in Table VI, the three avenues through which most employers get their technicians are as follows: (1) persons with some college training, trained on the job, (2) up-graded "top-notch" mechanics, and (3)

TABLE VI-SOURCES OF TECHNICIAN-LEVEL EMPLOYEES

Source	Number of Employers Obtaining Technicians from Each Source	Per Cent From Each Source (Range)	Average Per Cent From Each Source
Employ people with some college training and train them on the job	57	5-100	41
Upgrade "top-notch" Mechanics and train them on the job	55	5-100	47
Employ formally trained technicians, direct from junior colleges, area vocational schools, etc.	53	4-100	42
Attract them away from competitors	26	5-100	22
Use engineers and scientists as technicians	18	10-40	25
Use technicians trained in the armed services	12	5-40	15

formally trained technicians direct from junior colleges, technical high schools, technical institutes, and area vocational schools.

Immediate Need for Industrial Technicians

In order to provide some insight into the type of industrial technicians likely to be needed in the State of Missouri during the 1960-1970 decade, data were gathered relating to the immediate need for technicians, by specific job titles. An indication of the immediate need for industrial technicians and the type of technical workers needed is given in Table VII.

Employment Opportunities for Health Service Technicians

Employment opportunities for health service technicians were obtained by adding the 1960-1970 increase in employment of technicians to the estimated ten-year separation figure for each technician group.

As revealed in Table VIII, 4,482 employment opportunities are expected to become available for health service technicians by 1970. Approximately 65 per cent of the expected employment opportunities will become available as a result of normal employment and occupational growth. The other 35 per cent will become available as a result of separations from the labor force.

TABLE VII-TECHNICIANS NEEDED IMMEDIATELY BY MISSOURI INDUSTRIES

Job Title	Number of Industries Expressing Need	Number Technicians Needed Immediately
Draftsmen	17	66
Laboratory technicians	12	52
Inspectors	5	43
Chemical technicians	4	34
Engineer's aids	7	20
Tool designers	8	16
Unclassified*	1	14
Engineering technicians	10	13
Estimators	10	12
Production technicians	10	11
Agricultural technicians	1	5
Methods technicians	1	4
Electronic technicians	3	3
Maintenance technicians	2	3
Sales technicians	1	1
Styling technicians	1	1
Total	93	298

*The respondent failed to furnish the specific job titles for this group of technicians.

TABLE VIII-EMPLOYMENT OPPORTUNITIES FOR TECHNICIANS IN MEDICAL AND HEALTH SERVICES IN 1960 AND PROJECTED TO 1970

Technician Group	Increase From 1960 to 1970	Number Separated 1960 to 1970		Employment Opportunities
		Males*	Females**	
Medical Technologists	516	40	258	814
X-ray Technicians	718	35	226	979
Other Health Service Technicians	1,851	112	726	2,689
Total	3,085	187	1,210	4,482

*Based on the assumption that 39 per cent of the total technicians in 1960 were males and a separation rate of 128 per thousand.

**Based on the assumption that 61 per cent of the total technicians in 1960 were males and a separation rate of 128 per thousand.

Number of Trained Technicians Expected to Enter the Labor Force During the Decade

The number of technicians expected to enter the labor force during the decade were ascertained by computing the number of training opportunities and training completions and by applying placement rates to the number expected to complete technical training during the decade.

Table IX contains a summary of the number of training opportunities, the number expected to be trained and the number expected to enter technical occupations during the decade.

Training opportunities for industrial technicians in Missouri's public schools are based on the assumption that an average of five new day preparatory programs will be opened each year during the 1960-1970 period.

TABLE IX-TECHNICIANS ENTERING THE LABOR FORCE

Source of Training	Training Opportunities	Number Trained	Number Expected To Enter Technical Occupations*
Industrial Technicians	7,139	5,806	4,512
Public Schools			
Cooperative classes	482	420	140
Day preparatory classes	3,492	3,145	2,579
Private Schools	3,165	2,241	1,793
Medical and Health Service Technicians	4,120	3,948	3,340
Cooperative classes			
Dental Technicians	275	237	194
Medical Technicians	355	311	255
Hospital Schools			
X-ray Technicians	1,240	1,190	1,012
Medical Technologists	2,250	2,210	1,879
Total	11,259	9,754	7,852

*Computed by applying completion rates to the number trained by each agency.

The Imbalance

The imbalance between employment opportunities and the number of training opportunities, training completions, and expected trained occupational entries is indicated in Table X. It is estimated that there will be 3,176 more employment opportunities for industrial technicians than training opportunities. Employment opportunities are expected to exceed the number of trained occupational entries by 5,803 during the 1960-1970 period.

The number of employment opportunities for health service technicians is expected to exceed training opportunities by 362. Since all health service technicians are not expected to enter the occupations for which they are trained, it is estimated that the number of trained health service technicians entering the labor force during the 1960's will be 1,142 less than the expected employment opportunities.

The imbalances between the employment opportunities and the training opportunities for industrial technicians in Missouri is further illustrated in Figure 2. The imbalance between employment opportunities and the number expected

TABLE X-EXPECTED IMBALANCE BETWEEN EMPLOYMENT OPPORTUNITIES AND TRAINING OPPORTUNITIES DURING THE 1960 - 1970 DECADE

Technical Occupation	Employment Oppor-tunities*	Training Oppor-tunities*	Apparent Imbalance**	Expected Trained Occupational Entries***	Expected Imbalance****
Industrial Technicians	10,315	7,139	-3,176	4,512	-5,803
Health Service Technicians	4,482	4,120	- 362	3,340	-1,142

FIGURE 2

COMPARISON OF TOTAL EMPLOYMENT OPPORTUNITIES, TRAINING OPPORTUNITIES, TRAINING COMPLETIONS, AND EXPECTED TRAINED OCCUPATIONAL ENTRIES FOR INDUSTRIAL TECHNICIANS DURING THE 1960-1970 DECADE EXPRESSED AS A PER CENT

to enter the labor force is also illustrated. The three variables—training opportunities, training completions, and expected trained occupational entries—are expressed in terms of their relationship to total employment opportunities. It will be observed that the number of expected trained occupational entries is estimated to be less than one-half of the employment opportunities. The number of training opportunities is estimated to be approximately 31 per cent less than employment opportunities, and the number of expected training completions is estimated to be approximately 45 per cent less than the employment opportunities.

Figure 3 graphically illustrates the imbalances expected between employment opportunities and training opportunities for technicians in the health services. Projected training opportunities are approximately ten per cent less than the projected employment opportunities. The number of trained occupational entries is expected to be approximately 25 per cent less than the expected number of employment opportunities.

A reasonably large imbalance was also found to exist between the number of different technical occupations in the State and the number of pre-employment technical training programs in operation in the schools included in the study.

As indicated in Table XI, there were 32 technical occupations in the industries covered by the study. Training programs were being offered in only 12 of the 32 technical occupations.

FIGURE 3

COMPARISON OF TOTAL EMPLOYMENT OPPORTUNITIES, TRAINING OPPORTUNITIES, AND EXPECTED TRAINED OCCUPATIONAL ENTRIES FOR HEALTH SERVICE TECHNICIANS DURING THE 1960-1970 DECADE EXPRESSED AS A PER CENT

Figure 4 illustrates the imbalance between the number of technical occupations and the number of technical training programs in the State.

FIGURE 4

COMPARISON BETWEEN CURRENT TECHNICAL TRAINING PROGRAMS AND TECHNICAL OCCUPATIONS IN SELECTED INDUSTRIES AND AGENCIES EXPRESSED AS A PER CENT

The technical training programs in all schools studied represent less than one-half of the technical occupations in the selected industries studied. The number of public school day preparatory technical training programs represent less than one-tenth of the technical occupations in Missouri.

Conclusions

Insofar as the assumptions on which the estimates are based are sound, and the data gathered from the survey are representative of the State as a whole, the following conclusions may be drawn relative to the projected employment opportunities and training needs for technicians in Missouri up to 1970:

Employment opportunities for technicians in Missouri may be expected to continue at a high level throughout the decade.

Since the increase in the employment of technicians is expected to continue at a faster rate than total employment, it is apparent that technicians are playing an increasingly important role in the economy of Missouri.

In-service technical training is needed in most of Missouri's industries. Employers in these industries expect some of their in-service training needs to be provided by vocational-technical schools, area vocational schools and junior colleges.

Pre-employment training is not being provided in many of the technical occupations found in Missouri industries. The imbalance between pre-employment technical training programs and the technical occupations found in the State is sufficient to warrant considerable expansion of the technical curriculums in the public schools of the State.

Since a sizeable percentage of the employers in the State employ formally trained technicians, it seems reasonable to conclude that graduates of technical programs will have little difficulty in finding jobs.

Scientists and engineers in the State devote a considerable portion of their time to the performance of functions which could be performed by technicians. In view of this fact, the number of employment opportunities for industrial technicians may be expected to exceed the number estimated in this study if industrial employers in the State discontinue using their professional personnel in a technician capacity.

Since the expected training opportunities for industrial technicians are based on the assumption that new programs will be started each year in the decade, there is a need to begin the training of teachers of technical occupations.

Industrial employers in the State employ a high percentage of their technical workers direct from technical schools. They also expect the schools to play a major role in retraining displaced workers for technical occupations. Therefore, vocational-technical educators and school administrators face a real challenge from industry to accept the responsibility of assuring an adequate supply of technically trained workers.

In view of the fact that there is expected to be a shortage of trained medical technicians, and since the training prescribed for many medical laboratory workers is of shorter duration than the four years required for registered medical technologists, it is apparent that the imbalance between training opportunities and employment opportunities could be corrected, in part, by establishing some of the prescribed short-term pre-employment training programs in the public schools.

Recommendations

In view of the findings and conclusions of this study, the following recommendations are made:

The junior colleges that are expected to be established in the State should devote a considerable portion of their facilities to the training of industrial and health service technicians.

In as much as the employment opportunities for industrial technicians are expected to be more numerous than the training opportunities, additional technical programs will need to be started each year during the decade and they will have to be started at a faster rate than during the past few years.

Since there is a shortage of trained technicians in the State and at the same time a fairly high rate of general unemployment, it is evident that counselors have not been aware of, or not concerned about, changes in the occupational structure in Missouri. This condition suggests that expansions and improvements should be made in vocational guidance, counseling, and placement services. It also means that those responsible for educational planning and expansion during the current decade should give more consideration to the demands of the labor market.

In view of the fact that a large portion of the projected training opportunities depend on the expansion of new technical programs, considerable effort should be made to train teachers of technical occupations.

Since training opportunities for industrial technicians are based on the opening of several new programs each year in the decade, a much higher percentage of the school population should be enrolled in technical classes each year. This also means that counselors and teachers should make special effort to acquaint the students with the new technical training programs.

In as much as a shortage of trained technicians can hamper the industrial growth and the welfare of the State, as well as jeopardize our national defense, all interested groups should cooperate in developing adequate vocational-technical education programs.

MISSOURI

This study was made to compare the probable supply of and demand for skilled industrial workers in Missouri from 1961 through 1970, and to interpret the implications of the findings for the vocational education program of the State. The data were obtained from publications and unpublished documents of federal and state agencies and from previous research relating to the problem. Conclusions were that the employment of skilled workers is expected to increase in nearly all of the nonagricultural industries in the state during the coming decade. The employment outlook is good for the skilled trades of automobile mechanics, machinists, millwrights, tool and die makers, carpenters, plumbers and pipefitters, and electricians. However, the overtraining in the areas of printing crafts, tinsmithing, coppersmithing, sheet metal, painting, paperhangers, and glaziers might result in an over-supply of these workers. Educational implications were that (1) Closer cooperation should be established among all agencies responsible for the guidance and training of skilled workers, (2) The public schools need to examine the numbers of workers trained in relation to the demand, and (3) The guidance program should seek out those students who may best profit from training for skilled jobs. This is a summary of a D.Ed. dissertation which was submitted to the University of Missouri. (HC)

PREFACE

The skilled trades, the "royal occupations" in the world of labor, have been the major concern of vocational-industrial educators the world over from the very beginning of pedagogically organized vocational education. Although other types of industrial and service occupations are pressing for a place in public school training programs, the skilled trades are certain to hold an important place in the years ahead.

Lacking definite information on employment opportunities and training needs, school administrators and instructors of vocational education have no other choice except to make the best estimate they can in regard to the occupations for which the school should offer training and the number of persons to be trained in any given specialty. In other words, they must depend on "educated guesswork."

Reported here in summary form are the findings, conclusions, and recommendations of a doctoral study designed to inventory present employment opportunities and training facilities for the skilled trades in the State of Missouri and to forecast the employment opportunities and training needs in the State for the ensuing decade. The study should be of interest and assistance to school administrators, counselors and teachers in providing sound vocational guidance and training for youth and adults. Likewise, the Employment Service should find the study helpful in its work in counseling and placing workers. Finally, it is believed that the study should be of some interest to employer and employee groups.

Purpose of the Study

The purpose of this study was to compare the probable supply of, and demand for, skilled industrial workers in Missouri from 1961 through 1970, and to interpret the implications of these findings for the program of vocational education in the State. More specifically, this study sought to answer the following questions:

1. How many employment opportunities for skilled workers will become available in Missouri from 1961 through 1970?
2. Which skilled industrial occupations will provide the greatest number of employment opportunities during the decade? Which industries in the State will offer the largest demand for skilled workers in 1970?
3. How will the expected number of skilled industrial workers to be trained in Missouri compare with the expected employment opportunities for such workers during the decade?
4. How will the number of skilled industrial workers who may be expected to enter the occupation for which they are trained compare with the expected employment opportunities for the decade?
5. What are the implications of these findings for the programs needed in vocational education in Missouri?

Definition of Terms

A "skilled industrial worker" refers to an individual who possesses a high degree of manipulative skill and can perform practically all the operations of his job, is in command of the necessary scientific facts, can complete the necessary calculations essential to the performance of his work, and make judgments and decisions regarding given situations.

A "training opportunity" refers to the opportunity of an individual to enter, and carry through to completion, a training program designed to prepare him to enter a skilled occupation.

An "employment opportunity" refers to the opportunity of an individual, who has been trained as a skilled worker, to obtain employment in that skilled occupation.

A "skilled occupation" refers to an industrial occupation that requires a high degree of manipulative skill, application of technical knowledge, and completion of necessary calculations essential to the job. The occupation demands more manipulative skill than it does application of scientific knowledge. The nature of the work would lie between that of the semi-skilled machine operator and the technician.[1]

A "registered apprentice" refers to a worker who learns, according to a written agreement, a recognized trade requiring two or more years of work experience on the job through employment supplemented by appropriate related trade instruction.[2]

[1]United States Office of Education, *Vocational-Technical Education for American Industry,* Circular No. 530. Washington, D. C.: Government Printing Office, 1953, p. 2.
[2]United States Department of Labor, Bureau of Apprenticeship and Training, *The National Apprenticeship Program,* (Government Printing Office, Washington, D. C., 1953), p. 2.

A "non-registered apprentice" refers to a worker who learns a recognized trade requiring two or more years of work experience on the job through employment supplemented by appropriate related instruction. If a written agreement is made, it is not registered with the Bureau of Apprenticeship and Training.

Instruction is "less than college grade" when (a) it is terminal in nature rather than directed toward a baccalaureate degree, (b) the college catalog clearly states that the course is of less than college grade, and (c) the course is not designated or accepted by the college to apply toward a bachelor's degree.[3]

Sources of Data

Data for the study were obtained from the following sources:

1. Publications of the United States Department of Commerce, Bureau of the Census.
2. Published and unpublished data from the United States Department of Labor, Bureau of Labor Statistics, Bureau of Employment Security, and Bureau of Apprenticeship and Training.
3. Published and unpublished data from the Missouri State Department of Employment Security.
4. Publications of the United States Department of Health, Education, and Welfare, Office of Education.
5. Published and unpublished data from the State Board for Vocational Education and the State Department of Education for Missouri.
6. Published and unpublished data from previous research relating to the problem.

Total Non-Agricultural Employment

The parameter used to project employment opportunities for skilled workers was the total non-agricultural employment in the State. Non-agricultural employment is comprised of the total employment in durable and non-durable goods manufacturing plus the total employment in non-manufacturing industries.

There were 1,348,700 persons employed in all non-agricultural industries in Missouri in 1960 and this is expected to increase by 14.48 per cent to 1,533,619 in 1970, as shown in Table I.

Of the twelve manufacturing industries included in the study, eight were expected to increase in employment. The transportation equipment industry provided the largest employment of any manufacturing industry, 59,000, and is expected to increase to 99,498 in 1970. Substantial increases in employment are also expected in chemical and allied products, from 22,300 in 1960 to 27,039 in 1970 and in paper and allied products, from 12,700 in 1960 to 16,938 in 1970. The only non-manufacturing industry included in the study which is expected to increase in employment is contract construction, from 65,100 in 1960 to 80,698 in 1970.

Skilled Workers Employed in Non-Agricultural Industries

The changes expected to occur in skilled employment in relation to the total employment in the various industry groups between 1960 and 1970 are illustrated in Figure 1.

Fifteen industrial groups were included in the study. Of these, eight are expected to have an increased percentage of skilled workers in them. Ten of the fifteen are expected to have an annual percentage change of less than two per cent. Only three of the fifteen industries are expected to have an annual change of more than four per cent. The largest annual increase, 5.44 per cent, in the employment of skilled industrial workers is expected to be in the mining industry. This is represented by an increase from 11.72 per cent in 1940 to 43.09 per cent in 1970. The largest annual decrease, 4.6 per cent, is expected in the lumber and wood products industry. The percentage of skilled employment in the contract construction industry is expected to decline from 61.17 per cent in 1940 to 50.13

FIGURE 1

SKILLED WORKERS AS A PER CENT OF TOTAL EMPLOYMENT IN SELECTED INDUSTRIES OF MISSOURI 1960 AND 1970

-7-

per cent in 1970. In spite of this expected decline, the ratio of skilled workers to the total contract construction employment remains the highest percentage of skilled employment in any single industry group.

As revealed in Table II, the total number of skilled workers employed in non-agricultural industries is expected to increase from 193,903 in 1960 to 239,124 in 1970. Nearly 42 per cent of the total number of skilled workers are expected to be employed in three industry groups: transportation equipment manufacturing, 24,964; transportation, communication and other public utilities, 34,383; and, contract construction, 40,454. Only two industry groups, furniture and fixtures and lumber and wood products, are expected to employ fewer than 1,000 skilled workers by 1970.

Employment in Skilled Industrial Occupations

In addition to the estimates of skilled workers employed in non-agricultural industries, an estimation was made of the employment in selected skilled occupations through 1970. Approximately 70 per cent of all skilled workers in the State are employed in these occupations.

As shown in Figure 2, most of the skilled occupational groups included in the study are expected to have between 1,000 and 9,000 employed in them. However, four occupational groups are expected to be substantially above 9,000 employed. These are: automobile mechanic and repairman, 41,201; carpenter, 30,130; machinist, millwright and tool and diemaker, 18,006; and, electrician, 11,024. Conversely, three occupational groups, blacksmith, forgeman and hammerman, boilermaker, and metal molder, are expected to employ fewer than 500 workers in each.

Employment Opportunities in Skilled Occupations

As revealed in Table III, the expected number of employment opportunities for skilled workers in the selected occupational groups between 1960 and 1970 is 79,938. This figure is reported as an adjusted total because of the negative employment opportunities reported in three occupational groups.

The range of employment opportunities in the various skilled occupational groups is expected to be extremely large, ranging from a minus 418 to 19,498. The automobile mechanic and repairman and carpenter occupations are expected to provide the greatest number of employment opportunities during the decade, 19,498 and 12,420, respectively. A surplus of skilled workers is expected in three occupational groups: stationary engineer, 418; blacksmith, forgeman and hammerman, 90; and, metal molder, 81. However, since some of these workers are likely to be in the upper age groups, and since the numbers are small, this surplus can hardly be regarded as a serious employment problem.

Employment Opportunities in Selected Non-Agricultural Industries

The employment opportunities for skilled workers in selected non-agricultural industries are indicated in Table IV.

TABLE II-SKILLED WORKERS EMPLOYED IN SELECTED NON-AGRICULTURAL INDUSTRIES IN 1960 AND PROJECTED THROUGH 1970

Industry	1960			1970

				(79,931)*

Average separation rate: 179.0 per 1,000 employed.
*Adjusted for negative employment opportunities.

The transportation equipment manufacturing industry is expected to provide the largest number of employment opportunities for skilled workers during the decade, 12,906. Closely following, the second and third largest demand is expected to occur in the construction and transportation, communication and public utilities industries, 11,796 and 10,775, respectively. Three industry groups are expected to have a small surplus of workers: furniture and fixtures manufacturing, 211; primary metal products, 175; and, lumber and wood products, 99. The remaining industry groups are expected to provide a moderate number of employment opportunities during the decade, between 700 and 5,000.

Total Enrollments in Selected Day-Trade and Cooperative Classes

The total yearly enrollment in those day-trade and cooperative education classes included in the study was the parameter used to project the training opportunities for skilled workers in the secondary schools of the State.

As indicated in Table V, the total yearly enrollment in those day-trade and cooperative classes included in the study is expected to decline from 2,213 in 1960-61 to 2,060 in 1969-70. This represents an average annual decline of 2.83

TABLE V-TOTAL ENROLLMENTS IN SELECTED* DAY TRADE AND COOPERATIVE CLASSES PROJECTED THROUGH 1969-70

School Year	Number of Students**
1950-51***	2,558
1951-52	2,369
1952-53	2,402
1953-54	2,891
1954-55	2,581
1955-56	2,192
1956-57	2,520
1957-58	2,558
1958-59	2,561
1959-60	2,230
1960-61	2,213
1961-62	2,196
1962-63	2,179
1963-64	2,162
1964-65	2,145
1965-66	2,128
1966-67	2,111
1967-68	2,094
1968-69	2,077
1969-70	2,060

*Total enrollment in Missouri in fourteen skilled industrial occupation training programs.

***1950-51 to 1959-60 figures are reported enrollments, all others are projected.

per cent. The average yearly number of students enrolled in the selected classes is expected to be 2,136 for the decade.

Total Skilled Worker Training Opportunities in Day-Trade and Cooperative Programs During the 1960-1970 Decade

The potential number of training completions, used to estimate the number of trainees actually completing the training program, was based on the mean length of the training programs. The average length of training program was found to be 1.5 years for day-trade students and one year for cooperative education students who were enrolled in those classes included in the study.[4] These training program lengths were found through a survey of the enrollments in day-trade and cooperative classes in the following schools:

Hadley Technical High School, St. Louis
O'Fallon Technical High School, St. Louis
Manual High and Vocational School, Kansas City
Hillyard Vocational School, St. Joseph
Benton High School, St. Joseph
Central High School, St. Joseph
Springfield Vocational-Technical School, Springfield
Lead Belt Technical School, Bonne Terre
Joplin Senior High School, Joplin
Kirksville Senior High School, Kirksville
Poplar Bluff Senior High School, Poplar Bluff
William-Chrisman High School, Independence
